The centerpiece of the *Monthly Review* tradition has been its critique of contemporary capitalism, or what Baran and Sweezy term monopoly capitalism, because it is dominated by large corporations working in oligopolistic markets. This historically specific understanding of modern capitalism provided me with a framework to understand the broad pressure behind the critical junctures of the Progressive Era and the 1930s and 1940s. The *Monthly Review* tradition never tried to show how existing capitalism conforms to predictions made by Marx in 1867 or Lenin in 1914. Rather, the object is to understand how contemporary capitalism works based on its actual behavior using tools provided by Marx, Veblen, Keynes, Steindl (e.g., 1976), Kalecki, and Hansen, among others. Unlike too many mainstream economists, the *Monthly Review* tradition does not assume that the market is neutral or benevolent, that class inequality is natural, and that capitalism is ahistorical. And unlike too much of both Marxist and mainstream economics, the *Monthly Review* analysis includes a refreshing integration of the actual real-world capitalism of finance and corporate behavior into its theory. It is an empirically driven analysis, which I found complemented much of my neoclassical education in economics.

Baran and Sweezy's core argument is that monopoly capitalism has a strong tendency toward economic stagnation. Unlike neoclassical theory, which argues that the system tends toward full employment if the market is left to its own devices, Baran and Sweezy argue that the system tends toward crisis and depression. They laid this out in a book titled *Monopoly Capital* (Baran & Sweezy, 1966). In fact, while there is a good deal of debate over the merits of the *Monthly Review* position, their fundamental argument has proven valuable and provides a superior context for understanding economic policymaking in our times.

The second tradition that influenced me was the work of C. Wright Mills and Jürgen Habermas, which I found closely related. Mills's work drew attention to the importance of the public sphere and provided a searing critique of the problem of depoliticization in the United States. (For a superb recent overview of Mills, see Aronowitz, 2003.) When I entered graduate school in 1983, I considered this the single most important issue for social scientists to address in the United States; it remains almost as important to me today. Like Mills, I found the fingerprints of the media all over the deplorable state of our political culture. I found Mills's *The Power Elite* (1956) to be one of the most extraordinary books I had ever read. Although written in the 1950s, its critique resonated with what I saw in the United States of the 1980s, and what I see today.

In some ways Mills pointed to the issues that Habermas would later trigger with the translation of *The Structural Transformation of the Public Sphere*, and I consider Habermas to be making a similar argument. Habermas paralleled Mills's critique of

modern Western liberal democracies. His argument made communication a central component of democracy, the structural/institutional basis for communication of paramount importance, and regarded both business and government domination of media as problematic for democracy (Habermas, 1991). A central problem in the political economy of communication had been the matter of determining a more democratic media system than that provided by the market. The problem has been that much more vexing because the “really existing alternative” to capitalism and commercial media for much of the twentieth century – the communist systems in Eastern Europe and Asia – were singularly unattractive from a democratic perspective (Sparks, 1997, 2001; Zhao, 1998). Habermas’s notion of the public sphere, a place where citizens interact that is controlled by neither business nor the state, has provided an operating principle for democratic media. Following this logic, the policy trajectory of much political economic research in communication, certainly my own, has been to establish a well-funded non-profit, non-commercial, heterogeneous communication sector that is decentralized and controlled in a democratic fashion. Habermas’s formulation was absolutely crucial in moving the debate in media studies away from the dominant notion that there were two – and only two – ways to organize media: the free, private media of democracy or the state-controlled media of authoritarian societies.¹²

Third, Harold Innis, Marshall McLuhan, and Neil Postman each provided provocative critiques of society oriented around media technology.¹³ The Canadian economist Innis (1946, 1950, 1951) wrote long studies on the importance of communication systems and technologies in the course of human history. His approach was historical and sociological, locating communication in relation to social and political development. Innis argued that communication technologies were of paramount importance in understanding human development, and that they had profound biases. His work went far beyond traditional political economy and was influential most notably on James Carey, one of the founders of US cultural studies. (For a terrific interview with Carey where he discusses his intellectual antecedents, see Packer and Robertson, 2006.) Marshall McLuhan was also an acolyte of Innis, though this Canadian English professor altered Innis’s arguments and disseminated them widely. He is best known for his notion that the “medium is the message,” that media are changing the very way we think and that human societies operate (McLuhan, 1962, 1999; McLuhan & Fiore, 1967; McLuhan & Zingrone, 1995). His work was very influential on innumerable thinkers, including Postman. Innis and McLuhan both, perhaps due to their nation of origin, did not share the embrace of US mainstream academic satisfaction with the commercial media status quo, and they were more than willing to greet the imperial claims of US scholars with skepticism. Their work opened the door for far more critical takes on communication, technology, and society. Postman’s work, especially *Amusing Ourselves to Death* (1986), had the same effect (see also Postman, 1971, 1976, 1992, 1993, 1994, 1996, 2000; Postman & Powers, 1992; Postman & Weingartner, 1969). It created space for critical work.

Since media and communication sectors were generally defined by a specific technology – e.g., press, telegraph, film, radio, TV, cable, and so on – I found that this

work provided an important entrée to the issues that concerned me, like depoliticization. I was immediately hostile to anything that smacked of technological determinism, but I was also convinced that media technologies did have significant impact, what Marxists liked to call “relative autonomy.” Fundamental media technologies, which often emerged in a critical juncture, tended to be “path dependent,” meaning that once society opted for them, it was very difficult to switch to a different technology, even if that new technology was superior. Media technologies had unintended consequences. Today, it strikes me as quite plausible that the electronic media avalanche that people, especially children, are experiencing is having considerable effects upon them, arguably for worse.¹⁴ These effects are so closely intertwined with the commercialism that drives media in the United States that it is not always possible to disentangle the technological effect, but that does not mean there isn’t one. A great deal more research is needed.

The inability of the political economy of communication to gain traction, to command the respect of its adversaries, during the critical juncture of the late 1960s and early 1970s put it in a precarious position by the 1980s. Political economists of communication saw our work as part of a broader intellectual and political movement for social justice and peace. When social activism outside the academy was strong, it energized the research and gave it meaning. The politics in society as a whole provoked important and pressing research questions. There was an implicit understanding that the research could contribute to social change. There was always a legitimate concern that research could turn into cheerleading, but healthy debate, rigorous standards, and the actual events taking place on the ground would serve to keep the research credible, original, and focused.

The problem for the political economy of communication (and critical work more broadly) came in the 1980s, when it was clear that the social movements of the 1960s and 1970s had collapsed. Instead of having an army of supporters off-campus, critical scholars were all alone and very lonely. Political economists of communication appeared to unsympathetic observers as absurdly out of touch with reality, and the research was increasingly stigmatized as more of an ideological exercise than a branch of scholarship. The dynamism in the official culture was all on the right, and anyone on a college campus in the mid-1980s could not help but be aware of the changes. The prospects for progressive social change could not have been much bleaker, and all hands were on deck simply trying to maintain the status quo from further right-wing attacks. In this context all critical work, especially political economy of communication research, began to lose its moorings. If social change for the better was unlikely or impossible, what exactly were we trying to accomplish with our work? The work then turned to providing a critique of the status quo with a vague goal of eventually down the road contributing to an enlightening of students and citizens who will rise up in rage against the machine. Even the most brilliant work of the late 1980s, say Herman and Chomsky’s *Manufacturing Consent*, allowed little hope that changing the media system or the society as a whole was a plausible goal. We were simply learning how the system worked for intellectual self-defense. We

were speaking truth to power, but we had no illusions that we were in any position to contest that power.

At any rate, political economy had lost its “mojo,” and the dynamism that marked the field into the 1980s was a thing of the past. When Gerbner’s *Journal of Communication* published its follow-up special edition on the state of the field in 1993, a mere three of the 20 essays were by political economists, and only a couple more by critical scholars sympathetic to political economy. And the *JOC* was edited by George Gerbner, who had been the mentor and benefactor of scholars working in the political economic tradition. A mainstream journal edited by any other prominent member of the field might have excised political economy altogether.

Starved of resources, with precious little institutional support, and in a hostile political environment, the political economy of communication produced a surprising amount of important and high-quality research. Although Smythe died at the beginning of the 1990s and Schiller left us at the beginning of the next decade, Mattelart (Mattelart, 1994, 2000, 2003; Mattelart & Mattelart, 1992, 1998) and the four Brits – Garnham (1990, 2000), Curran (Curran, 1995, 2000, 2002; Curran & Couldry, 2003; Curran, Ecclestone, Oakley, & Richardson, 1986; Curran, Gaber, & Petley, 2005; Curran & Gurevitch, 2000, 2005; Curran & Morley, 2005; Curran & Seaton, 2003), Golding (Bondebjerg & Golding, 2004; Deacon & Golding, 1994; Ferguson & Golding, 1997; Golding & Harris, 1997; Golding & Murdock, 1997; McQuail, Golding, & Bens, 2005), and Murdock (Wieten, Murdock, & Dahlgren, 2000) – have remained productive, and the situation in Britain was arguably no better for political economy of communication by then than in the United States. The second generation of US scholars who came of age in the 1970s and 1980s proved highly productive and have done original work in a broad range of areas.¹⁵ The real crisis facing the field is that because of the enormous constraints it did not spawn a significant “third generation” of self-identified political economists of communication who were pushing the project forward and breaking substantial new ground.

Fortunately, that has all changed dramatically in the past decade.

By the early 2000s, signs of the beginning stages of a critical juncture were all around us. Of the three criteria that set the stage for a critical juncture, one was clearly in place, another looked to be in place, and the third factor loomed distinctly on the horizon (McChesney, 2003). The digital revolution was undermining much of the existing media industries’ business models, journalism was in freefall collapse, and the broader political economy ended the decade mired in crisis. To top it off, a media reform movement emerged under the guidance of Free Press that mobilized millions of US citizens around issues that had once been the private preserve of industry lobbyists.

In this context the political economy of communication has returned with a vengeance. Journals are publishing the research; universities are hiring in the area; and, most important, there is a large interest in the work among the general public. I will close this chapter by outlining what I regard as the key areas of research going forward. I count at least eight areas of “basic research” that require extensive work.¹⁶

- 1 A study of the policymaking process, with an emphasis upon history.
- 2 A detailed examination of the relationship of communication and information to the evolving global system of capitalism.
- 3 A critique of the market *per se* and a critique of media markets specifically.
- 4 A critique and study of advertising and the relationship of communication to marketing.
- 5 An integration of media and communication into democratic theory, with a rigorous study of journalism in this light.
- 6 A political economy of the Internet – looking at a myriad of issues that will determine the control and structure of the digital communication system, in particular telecommunications, spectrum, copyright, and privacy.
- 7 A study of different institutional structures for media enterprises and policies that have promoted different types of structures.
- 8 A study of global communication that takes up all these issues in a comparative and transnational sense, and that examines issues unique to the global communication system.

First, we need a much richer understanding of the policymaking process. We need a detailed empirical and possibly ethnographic examination of the policymaking process today. We have to better understand contemporary practices. We need to develop theoretical understanding of policymaking, and we need hard empirical analysis of how people influence policymaking. We also need historical case studies; as Susan Douglas argues, we need to convey the truth about our history to undermine the argument that what exists today is “inevitable.”

Second, it is often stated that capitalism is undergoing a dramatic transformation – most significantly, “globalization” – and that these fundamental structural changes owe in large part to developments with communication and information technologies. Often there are elaborate claims about increasing competition and innovation, with considerable effects upon productivity and economic growth. But we get far more pieties than we do hard research on these claims, and we lack detailed examinations on how the “new economy” works compared to the old one, and what the precise role of communication may be. In view of the centrality of communication to the economy, it is a travesty that scholars and policymakers are working with an understanding of the global transformation of capitalism that is based more on clichés than research. What is happening to the economy, in the final analysis, may be at the epicenter of the critical juncture. Communication scholars have an important role to play, alongside economists, in generating this research.

Third, the application of the simplistic notion of the “free market” to media needs a rigorous examination, even by political economists of communication (for a provocative discussion of this, see Perelman, 2006). If the second point addressed capitalism as a “macro” system, here I turn to microeconomics, or market and firm structure. Too often the “free market” has been accepted uncritically as the ideal structure for media industries, with little evidence to support the assumption. We

increasingly understand that the conventional model of free market economics has severe limitations in its applicability to any real-world economic situations. Some of the most important breakthroughs in economics in the past decade – e.g., the Nobel Prize-winning research of Joseph Stiglitz – have called into question the basic assumptions of the legitimacy of “free markets” as necessarily rational, efficient, and just regulators of human activity (Stiglitz, 1986, 1988, 1989; Stiglitz & Greenwald, 2003; see also Camerer & Fehr, 2006).¹⁷ There is important work along these lines in the work termed the “new Keynesian economics,” which has questioned the assumptions and claims of neoliberalism (Akerlof & Yellen, 1985; Gordon, 1990; Greenwald & Stiglitz, 1993; Mankiw, 1990, 1992; Summers, 1988; Tobin, 1993; Yellen, 1984).

That concern is doubly true for media markets, which tend to be much closer to non-rivalrous public goods, rather than traditional markets where the price tends to gravitate toward the marginal cost of the product. Some excellent economic analysis of media markets has been done, but nowhere near enough (Anderson & Coate, 2005; George & Waldfogel, 2006; Hamilton, 2004; Shapiro & Varian, 1998; Waldfogel, 2003). We also need a much harder examination of how media corporations actually operate, rather than assume that these complex bureaucracies follow the same pattern as the owner-operator small firm of the Adam Smith era. And we need a thorough examination of the notion that media firms, due to market pressures, “give the people what they want” (Meehan, 2005; McChesney, 2004, discusses this point at some length). This canard has been left unchallenged all too long, even by critical scholars. It is ironic that intellectuals have accepted this premise while the “masses,” in repeated public hearings over the past four years, have suggested that they do not feel the existing market accurately reflects their values or preferences.

Fourth, we need a systematic and comprehensive examination of the crucial role advertising plays, as it is the thread that connects communication to capitalism. Advertising is a fundamental aspect of commercial media markets, and has significant influence over media content, yet the amount of research examining it is paltry by almost any standard. All indications are that this commercial carpet bombing has a considerable effect upon our culture, and one is hard pressed to locate much on the positive side of the ledger.¹⁸ Inger Stole’s (2004) research indicates that advertising is evolving with the times, merging with public relations, and is even becoming a presence in the world of philanthropy, with dubious social implications. Even if we go to a digital communication system, there is no reason to believe that advertising and marketing will go away. Quite the contrary. We need to conduct hard research on the role, nature, and effects of commercialism in the digital media world. If the communication revolution, in the final analysis, merely provides a way for Madison Avenue to get into the DNA of our social nervous system, we may rue the day the computer was invented.¹⁹ In particular, the commercial indoctrination of children, as documented by Juliet Schor (2004), is largely unexamined and, as far as I can see, indefensible. Jeff Chester (2007), too, has done yeoman’s work to uncover what marketers are up to online.

Fifth, there is an enormous disconnect between political theory and communication studies, particularly journalism. Both suffer as a result. We need to integrate the two and make strong arguments about the role of communication in a self-governing society, and the sorts of institutions and values that must guide them. This theoretical inquiry must be informed by history and empirical research. There are many good reasons for this avenue of research to be pursued, but let me provide you with the most pressing one. Invariably what occurs in a critical juncture will be reviewed by the Supreme Court, and its constitutionality will be measured. What the First Amendment means for freedom of the press is likely to be determined in the coming generation, and scholars need to start preparing for it now. There has been tremendous pressure to make the First Amendment into a piece of protective legislation for media corporations and commercial values, although the courts have not gone all the way in that direction.

Specifically, Supreme Court rulings have defended the principle that the First Amendment belongs to the public, and not media owners, on the basis that spectrum scarcity permits the government to intervene on behalf of the citizenry. This is a very thin reed to hang such an important principle on, and it is unlikely to empirically survive the digital era. Our challenge is to answer this call, working with what has been left to us by Jefferson, Madison, Black, and Stewart to generate a democratic vision of freedom of the press as a necessity for all citizens and for self-governance – not just a privilege for investors and companies that happen to have holdings in the media sector. As cases work their way through the system in the coming generation, we need to have hard empirical research as well as thoughtful treatises on the relationship of a free press to self-governance and what this means for the First Amendment. It is still to be determined. The important point is that this is not a legalistic matter to be left to the lawyers; it is the most fundamental of policies that requires the active participation of communication scholars and engaged citizens. The simplistic interpretation of the First Amendment proffered by many communication scholars at present is insufficient to the task at hand.

The next two areas of “basic” research are somewhat more substantial and require greater explanation. Sixth, we have to think broadly about the Internet and what type of digital communication world we wish to build. What we need is a political economy of the Internet. The best work along these lines by far has been done by a handful of legal scholars (Benkler, 2006; Goldsmith & Wu, 2006; Lessig, 1999, 2001, 2004). Such a political economy entails a multitude of issues. On the one hand, it requires some big-picture analysis of the relationship of the Internet to global capitalism and to democratic institutions. On the other hand, it includes a handful of specific areas that all boil down to crucial policy debates that loom on the horizon. This means that telecommunication research must be more closely integrated into media studies. Convergence is obliterating the distinction.²⁰

A number of other research and policy issues surround the Internet. Digital communication is radically overturning most media industries. Music is already on the chopping block (for a good review of trends in the music industry, see Parks, 2007);

terrestrial broadcasting, daily newspapers and film are in the on-deck circle. All the other media industries are in line behind them, waiting their turn. We need to rethink copyright and intellectual property laws so that creative workers can receive just compensation for their labor without letting corporations put up barbed wire all over cyberspace, destroying the public domain and handcuffing creativity. Some new and pathbreaking communication research has developed the social and political implications of copyright (Bettig, 1996; Bettig & Hall, 2003; McLeod, 2005; Perelman, 2002; Vaidhyanathan, 2003, 2004). In many respects, the commercial media system as it has developed is a very bad fit for digital technology. Copyright has become, to some extent, a policy to protect out-of-date industries from change that would benefit everyone else, rather than a progressive policy and subsidy to promote creativity and culture. Similarly, we need to conduct research on privacy, surveillance, and data mining. How can we best protect privacy from governments and commercial interests? We need much more sustained research that leads to coherent policy proposals.

Seventh, even if we have a ubiquitous and affordable Internet, Net Neutrality, strict privacy protection, less restrictive copyright laws, and appropriate curbs on commercialism, all will not be settled in the digital media universe. Every bit as important, we have to use our intellects, imaginations, and research skills to develop alternative models for media organizations. Perhaps the most important lesson we have learned in the past decade has been that doing good media, even in the digital era, requires resources and institutional support. The Internet does many things, but it does not wave a magic wand over media bank accounts.

To do great media requires resources and compensated labor, and as a society we are going to have to generate policies, not unlike those created by the Founders, to spawn a vibrant media in the digital era. This is true across the board, but the crisis is most striking in the case of journalism, where the Internet not only doesn't fatten the bankroll, it doesn't offer protection when powerful government or business figures come after you. And good journalism will invariably antagonize someone in power. We need research that examines the institutional structures most conducive to vibrant journalism, as well as research that clarifies what factors produce the most negative effects. If one thing is clear, simply mixing the profit motive with digital technologies does not solve the problem.

Finally, we need to expand all of the above research to a global basis and internationalize our research. If the premises for US communication are disintegrating in a critical juncture, so must the assumptions of US scholars as we look at the world. We must work sympathetically with scholars and citizens in other lands facing situations similar to our own; they probably have more to teach us than we have to teach them (Morris & Waisbord, 2001; Price, 2002). This means doing hard comparative analysis of communication policies and systems in other nations. And we need to be more critical – in the intellectual sense of the term – toward the US government and commercial activities abroad; if we learn nothing else from the disastrous invasion and occupation of Iraq, it is that the assumption that the United States is a benevolent

force for good in the world needs to be established with evidence. A good starting point would be to regard the intentions and motives of the US government and corporations with the same skepticism – i.e., demand the same evidence for claims – we use in assessing the motives of other governments, especially those not on friendly terms with the US government. The double standard has never been defensible, but in a critical juncture it becomes pure propaganda.

Most important, while crucial policy decisions guiding the communication revolution are significantly national – and that is what I have emphasized herein – the global arena is growing in importance, and in an increasing number of cases it will override national policymaking. Moreover, these issues are closely tied to how the global political economy will develop, and how nations might improve the conditions for the mass of impoverished peoples. Already the question of whether media policies should be connected to global trade agreements has emerged; if they are so subsumed, that would override national policies (Geradin & Luff, 2004; Grant & Wood, 2004). Currently there are major debates globally over intellectual property and control and regulation of the Internet (Drahos & Braithwaite, 2002). There are serious questions concerning advertising and the disposition of the spectrum. There are also important questions about global economic development using the new communication technologies.

In sum, the political economy of communication provides a basis for research that goes to the heart of social and intellectual concerns today. The subfield cannot alone come close to providing comprehensive answers to all the great questions before us, but it can make a necessary and valuable contribution to all research on these matters.

NOTES

- 1 This was an obsession of James Madison, and likewise explains his obsession with having a viable independent press that would keep the government from becoming an empire. One scholar who has drawn the connection between US empire and domestic crisis that resonate well with a critical juncture analysis is Chalmers Johnson (2007).
- 2 <http://www.thebulletin.org/>
- 3 Profiles of Smythe and Schiller can be found in Lent (1995).
- 4 This includes much of his most important work.
- 5 Political economy of communication was anything but a monolithic enterprise in this period. Smythe's arguments provoked considerable and spirited debate. See, for example, Murdock (1978).
- 6 After initial success, Beacon Press bought the rights to the book, and a second edition was published in 1992 by Westview.
- 7 Schiller's final book was a fine restatement of his core positions and showed that he was keenly aware of global developments. See Schiller (1996).
- 8 I want to thank Dan Schiller specifically for much of the material in this paragraph.
- 9 Some of the work from the political economy tradition that caught my attention (and not mentioned elsewhere in this chapter) in the 1980s included: Ewen (1977); Gandy

- (1982); Jhally (1990); Leiss, Kline, and Jhally (1986); Mosco (1979, 1989); Schiller (1982); Turow (1984, 1989); Wasko (1982).
- 10 Sweezy (1970) also wrote arguably the finest introduction to Marxist political economy in the English language.
 - 11 I had the privilege of co-editing *Monthly Review* with John Bellamy Foster, Harry Magdoff, and Paul Sweezy from 2000 to 2004. I left MR when my work with Free Press took off, although I continue on its board of directors.
 - 12 The classic statement of this position ironically located four theories, but really came down to “us versus them.” See Siebert, Peterson, and Schramm (1956).
 - 13 Several people whom I respect followed the technological path to Jacques Ellul. That was never my trajectory, but for those interested, see Ellul (1965, 1980, 1990).
 - 14 I am not close-minded on this issue. See Shaffer (2006). For a provocative discussion about how our romanticization of the benefits of a print-dominated culture may obscure our ability to understand the benefits of the coming digital communications era, see Stephens (1998).
 - 15 This is some of the more impressive research generated by the political economy of communication tradition since the 1990s through to today, that is not mentioned elsewhere in the chapter: Gandy (1993, 1998); Hagen and Wasko (2000); Jhally and Lewis (1992); Mosco (2004); Pendakur (2003); Reese, Gandy, and Grant (2001); Splichal and Wasko (1993); Sussman (1991, 1997, 2005); Sussman and Lent (1998); Turow (1992, 1997); Turow and Kavanaugh (2003); Wasko (1992, 1994, 2001, 2003, 2005); Wasko and Mosco (1992); Wasko, Phillips, and Meehan (2001).
 - 16 Interestingly, these are areas that get far more attention as a rule in communication departments outside the United States. As ICA president Sonia Livingstone, a professor at the London School of Economics and Political Science, wrote to me upon reading this section of my manuscript: “I am less sure about ongoing US research, but I am clear that this is, exactly, the research agenda for many of us in Europe. Indeed, it reads like a run down of what’s going on in my department right now.” Sonia Livingstone email to the author, February 23, 2007.
 - 17 There are classic texts that make these points as well, and they are well worth reading: Bator (1960); Kapp (1950); Mishan (1968, 1971, 1973a, 1973b, 1973c, 1982, 1986); Scitovsky (1971).
 - 18 See, for example, Associated Press (2007, p. A5). I take up this point below in my discussion of the Internet.
 - 19 I am reminded of the comments of *New Republic* editor Bruce Bliven in the 1930s. He found broadcast advertising so “obnoxious” that he wished “the radio had never been invented” (cited in McChesney, 1994, p. 105).
 - 20 One very important scholar of telecommunications who has addressed the Internet directly is Milton Mueller (1992, 1993, 1996, 1997, 1998, 2004).

Unmasking Class and Tradition

Questioning Recuperative History and Affiliation in Cultural Studies

Cameron McCarthy and Jennifer Logue

ABSTRACT

Drawing on examples of cinematic and literary production, this chapter calls attention to the limitations of British cultural studies regarding topics on which the theorization of proponents has been long thought to be fundamentally secure. These topics are class and tradition. The chapter further maintains that the field-bound, ethnographic, and center-periphery paradigm that has fueled the subcultural studies approach to the working class of cultural studies has been overtaken by events associated with globalization in which culture is being separated from place and the long-held stable social identities associated with the working class are being disembedded. Now, identities have become more hybrid, and more coordinated across a plurality of styles, tastes, needs, interests, and organizational capacities. Working-class actors increasingly recuperate their identities in the domain of hyperconsumption rather than production. This is the era of the working class without work. Understanding this requires greater attention to the international division of labor and transnational and postcolonial perspectives.

Introduction

COMBO: Milk, I have got one question to ask you. Do you consider yourself English or Jamaican?

MILKY: [long pause] . . . English!

COMBO: That's what we need. That's what this nation has been built on. Proud men. Proud f. . .ing warriors. Two thousand years this little tiny f. . .ing island has been raped and pillaged by people who have come here and wanted a piece of it. Two f. . .ing world wars, men have laid down their lives for this. And for what? So we can stick our f. . .ing flag in the ground and say: Yes, this is England . . . and this is England . . . and this is England!

(From Shane Meadows's *This is England*)

To articulate the past historically does not mean to recognize it as "the way it really was" (Ranke). It means to seize hold of a memory as it flashes up at a moment of danger [. . .] In every era the attempt must be made anew to wrest tradition away from conformism that is about to overpower it.

(Benjamin, 1968, p. 255)

Some Preliminary Points

In a brilliant detour from his central project at hand – an assessment of the significance of the life and work of the great German art collector, caricaturist, and historian Edward Fuchs – Walter Benjamin pointed to an inescapable contradiction that cuts through all modern forms of cultural assertion, affiliation, and intellectual paradigms: “There is no document of culture,” noted Benjamin (2008), “which is not at the same time a document of barbarism” (p. 124). There is, as he went on to argue, no proper historical accounting of this kind of opposition. Each intellectual tradition struggles with this tension of bearing forth insight into the stratified world that it tries to apprehend and disclose and the weight of its own blind spots and narrowed parameters of vision. The stream of recuperative history of any intellectual tradition or movement – be it the Frankfurt School or cultural studies, or otherwise – when treated as a cultural artifact is not as Edward Said maintained a “palimpsest” (1985, p. 165), but is instead a fractured parchment revealing tensions, contradictions, unmoored orientations, and lines of flight. This methodological stance is particularly useful when one considers any exemplar of the revisionist neo-Marxist radical traditions. Here, our focus is on British cultural studies viewed from the perspective of postcolonial and transnational critique. Like Benjamin, we are interested in the way cultural studies addresses the past in light of the fractured present. For based upon even the most cursory consideration of the guiding assumptions of proponents, British cultural studies can be challenged in two areas in which this body of scholarship has

been always thought to be secure: the topics of class and tradition. These areas of cultural studies thought contain elements of the blind spots that Benjamin alluded to. We maintain, for instance, that British cultural studies proceeds from a repression or disavowal of the contradictions of tradition, affirming a class-conflicted modernity and a transhistorical universalism against a primordial past. British cultural studies proponents textually construct the working class as defined by an unyielding Britishness. Britishness becomes the organizing principle of class identity. The British working class stands in as proxy for the universal working class, enfolding the periphery in the center of the world. This is a formulation on class that is profoundly nation-bound and, more importantly, is written – as Anoop Nayak (2003) points out – aggressively against postcolonial subjects who enter the waning British scene of labor as immigrants from the colonies; as the metonymic “Pakis” or “Jamaicans” of Paul Willis’s *Learning to Labor* (1981).

In what follows, we address the turbulent relationship that British cultural studies scholars have with the concepts of “class” and “tradition” and the problematic social epistemological status of these key terms within the cultural studies literature. We maintain, in part, that these concepts have been deployed within a center–periphery thesis and a field-bound ethnographic framework by cultural studies scholars pursuing a subcultural studies approach. Within this framework, “Britishness” has been the silent organizing principle defining metropolitan working-class traditions and forms of cultural resistance. British cultural studies proponents have therefore pursued the study of class and culture as a localized, nation-bound set of interests. This has placed cultural studies in tension with postcolonial subjectivities often reduced, as they have been in the classic works of Paul Willis’s *Learning to Labor* (1981) and Dick Hebdige’s *Subculture: The Meaning of Style* (1979), to the metonymic “Pakis” and “Jamaicans.” We write against the grain of the textual production of the working class within cultural studies scholarship, insisting that recent films – such as *This Is England* (2007), *The Full Monty* (1997), *Billy Elliot*, (2000), and *Bend It Like Beckham* (2002) – and the literary works of George Orwell, George Lamming, Jeanette Winterson, and Kazuo Ishiguro, offer a more complex story of class identities in the age of globalization and transnationalism.

Further, we address these concerns ultimately pointing to the specter of globalization and the way it challenges the relevance and insightfulness of the postwar cultural Marxism of British cultural studies. We first grapple theoretically with the serviceable tradition that cultural studies draws on to authenticate and center the metropolitan working class in the discussion of class relations, understood transhistorically and universally. We point to the incommensurability of this approach in relation to the contextual reality of present-day postindustrial society and the profoundly limiting framework of nationalism which undergirds the British cultural studies subcultural approach to class. We argue further that this ethnocentric approach to class in British cultural studies scholarship cuts at right angles to the postcolonial subjectivities and the presence of the third world in the metropolitan working class. We then go on to call sharp attention to the nation-bound language and claims that attend the

discussion of the working class specifically in the writings of the great postwar cultural Marxists such as E. P. Thompson, Raymond Williams, and Paul Willis, among others. We then examine examples culled from popular film culture to show the complexity of the characterization of the working class that is found in contemporary film and paradoxically absent in the sociological writing of cultural studies. Complementing this we draw as well on the literature of George Orwell, particularly his essay "Shooting an Elephant" (1981). In this essay, Orwell offers a complex portrayal of a British working-class police officer operating on secondment overseas in the then colony of Burma. We conclude by drawing the outlines of the new global context that has precipitated a crisis of language in the neo-Marxist scholarly efforts to grasp the central dynamics of contemporary societies. The latter has led to a depreciation of the value and insightfulness of neo-Marxist analysis in our time. Old metaphors associated with class, economy, and state ("production," "reproduction," "resistance," "the labor-capital contradiction") are now all worn down by the transformations of the past decades in which the saturation of economic and political practices in aesthetic mediations has proceeded full scale (Klein, 2001, 2007).

Let us first consider the problem of class and tradition as they are conjoined in cultural studies.

Reading the British Tradition in Cultural Studies

It is sometimes said that butlers only truly exist in England. Other countries, whatever title is actually used, have only manservants.

(Ishiguro, 1989, p. 43)

Is it surprising that British writing on the industrial working class (or agrarian working class as Ishiguro alludes to above) asserts and proceeds by marking out an assiduously achieved Britishness, a sense of distinctiveness of the English in the mission even of class revolt? And, from this refusal of asceticism and the wanton affirmation of Britishness can cultural studies proponents and scholars be perceived as lumbering too far behind? This chapter is written to interrogate and to interdict cultural studies on the plane of its own discourse of historical recuperation, the recuperation of texts and textualism – the terrain of its recuperation of the selective radical tradition of the British working class and its deployment of "what counts" for cultural relevance in the consideration of change. We want to challenge the grounds of this presumptive deification of the metropolitan working-class cultural form and the elaborated scenario of transhistorical, neo-Marxist universalism in which Paul Willis's "lads" and their contemporaries overwhelmingly occupy the attention of neo-Marxist cultural studies scholars and stand in for the subject/object of history. This deification operates to the detriment of the third world subject either vanquished to the vast wastes of the colony and empire or displaced by globalization to the metropole.

We want to argue that British cultural studies, which has in the past few decades generated such emulation in the United States and elsewhere as an unconstrained critical program of analysis is, to the contrary, a deeply localist, particularistic, introspective, nativist, defensive project that from Leavis to Willis and beyond has been engaged in the invention of a national British radical tradition – fighting off the fog of disillusionment with Marxist orthodoxy on the one hand and resisting the ever-persistent deterritorialization of Britishness and British content in the cultural form of the susceptible British working class by US popular culture on the other. We want to argue, in part, that the birthing of the metropolitan working class as *flaneurs* of the modern is achieved at the point of petrification of the postcolonial subaltern. These are the “other Victorians” – working-class Asians and West Indians and so forth – who are measured at that xenophobic historical moment in Willis’s *Learning* and Hebdige’s *Subculture* in which they are metonymically produced as “Pakis” and “Jamaicans,” the blunt, butt end of the laughing fodder of the lads.

This neo-Marxist cultural studies ethnographic text in its documentary practice is indeed the product of a sensationalist media age and the impact of the cinematic and the culture of the visual on writing and enunciation. Marxist realism is a class realism. But, it is a realism no less. It achieves verisimilitude through the mimetic organization of the world in the text. Herein, the neo-Marxist text becomes socially extended and stratified like the world outside, with ruling and subaltern energies. Here, then, the effect is to use the text against those whom it would abandon. Those voiceless in the world are voiceless in text. The text is the incubator of British traditions. The world is set down according to a hierarchy of discourses and a bureaucratic deployment of subjectivity that Ian Watt and others have noticed in the rise of the nineteenth-century novel (Harris, 1967; Watt, 1957). The third world subject appears immersed on the wrong side of that fatal couplet text/experience – speechless, spoken for, drowning in the concatenation of events that makes experience and squirming before the steely eyes of the lads. Stripped of their texts, their organized meanings, their interpretations, they are without tradition, the hapless witnesses to the shock of the text – reduced to a form of helpless spectatorship. One remembers here the natives of Conrad’s *Heart of Darkness* who are allowed barely four words in the entire novel: “Mistah Kurtz – he dead” (Conrad, 1990, p. 240).

It is not surprising, then, that when Willis (2005) revisits the lads in some of his latest writings, the story of the lads is recounted without a mention of the children of the urban paradise lost – the West Indians jamming to reggae, the Asians desperate to join the “earholes.” We are reminded of that swiftly vanishing scene at the end of Mary Shelley’s *Frankenstein*. Here the unknowable box-headed monster is let go into the mist – a sublime end after a miserable and mundane tour of duty: “He was soon borne away by the waves and lost in darkness and distance” (Shelley, 1993). The natives counter-posed to the lads come to a mercurial end in the modernizing project of the neo-Marxists.

But our quarrel is not with Willis’s book *per se*. Its critical and utopian dimensions can be securely upheld, if not too overly celebrated, in the fields of humanities and

social sciences now punished as they are in the current neoliberal climate of the university by overwhelming paradigms and frames of reference of instrumental research and policy expectations. It should be rightly extolled. That *Learning to Labor* is both an imperialist as well as a postcolonial text is also difficult to ignore. *Learning to Labor* announces the arrival of the third world subject on the waning scene of British labor. A fundamentally buried theme in this book is the fact of the dynamic relationship between the working classes across the divide of the third world and the first in the reorganization of capital – the movement of images, bodies, and economic and cultural capital that we now call globalization. The whole disembeddedness of modernization that places the native prostrate at the feet of Albion – a marginal topic that now, in hindsight after *The Full Monty*, seems to be so deeply prophetic. (“Those are the pearls that were their eyes. Look!” [Eliot, 1954].) And, urban England would become a beachhead for Caribbean and Asian migrant labor. This dynamic would announce the post-Fordist logic that we find acknowledged more readily in films such as *This is England* (2007), *The Full Monty* (1997), *Billy Elliot* (2000), and *Bend It Like Beckham* (2002). There is a way in which the fates of immigrant labor and the lads and their dads are inextricably connected. It is this fate that is recognized in the work of Wilson Harris’s *Carnival* (1985), in the character of Everyman Masters who leaves the South American country of Guyana to join the British industrial working class some time in the 1960s. It is there in Samuel Selvon’s *Lonely Londoners* (1956), of the Barbadians, the Trinidadians and Jamaicans trying to eke out an existence in the coldness of London that would be their new post-national home. It is there in Salman Rushdie’s *Midnight’s Children* (1981). It is there too, of course, in George Lamming’s *The Emigrants* (1994) in the mass exodus of cooks, maids, carpenters, transportation workers, poets, and novelists traveling to England, leaving behind their folding little nations of the Caribbean Sea. It is with this movement or moveable tableau of the diaspora that the postcolonial subjects find in London an agonizing and antagonistic landing and precarious settlement.

To summarize, then, one of the ironic and unexamined effects of the emergence of the neo-Marxist and neo-Gramscian cultural studies text has been the founding of the metropolitan working-class subject, and the elaboration of the full interiority of its collective subjectivity, entirely at the expense, and with the corresponding deflation, of the postcolonial and subaltern identities in the urban context. This third-world, periphery subjectivity is constructed at the extremes of the semiotic space which the lads inhabit as a point of reference. Third world subjects are constructed outside the working class as petrified spectators. There, they stand beholding a scene not of their own making but much undone by it. And yet, they answer back, as the first stanzas of a high school student’s poem entitled “Mixed” will attest:

A marble cake describes my ethnicity
The two combined is unique
It’s beautiful while others disagree
They’re blinded by racism and can’t see

This is my identity
It was meant to be

I'm not ashamed to be a half breed.

(Bishop, 2006, p. 1)

Let us examine the status of the lads and the fate of their postcolonial other in the elevated discourses of British cultural studies more specifically. Specifically, we look at the status of the concept of tradition as it is textually mediated within British cultural studies and the way in which tradition impoverishes our understanding of the relations of the working classes across the divide of metropole and the periphery. We believe that contemporary film and literature point us more adroitly to the dilemmas of modern working-class subjectivity disembedded and impacted by globalization and multiplicity.

Re-Narrating Class and Cultural Studies

UPPER EASTSIDE WOMAN: Ooooh, did you make these?
 ZAINAB: Yes. I made it.
 UPPER EASTSIDE WOMAN: Oohh, how much?
 ZAINAB: Which one?
 UPPER EASTSIDE WOMAN: Mmmmm, this one.
 ZAINAB: That's thirty-five dollars.
 UPPER EASTSIDE WOMAN: Will you take thirty?
 ZAINAB: No. Thirty-five.
 UPPER EASTSIDE WOMAN: Okay. My daughter will think this is very cool. *She hands Zainab money.* Where are you from?
 ZAINAB: Senegal.
 UPPER EASTSIDE WOMAN: Ooh I was in Capetown two summers ago. It is SO beautiful!
 ZAINAB: Thank you very much.
 UPPER EASTSIDE WOMAN: What's your name?
 ZAINAB: Uh, Zainab.
 UPPER EASTSIDE WOMAN: Oooh, Zaaynob, so pretty!
 ZAINAB: Your change.
 UPPER EASTSIDE WOMAN: *Shrugs nonchalantly, grabs her forgotten change and walks away.*
 ZEV: How far is Senegal from Capetown?
 ZAINAB: About 8,000 kilometers.

(*The Visitor*, 2007)

The question is not what goal is envisaged for the time being by this or that member of the proletariat, or even by the proletariat as a whole. The question is what is the proletariat and what course of action will it be forced historically to take in conformity with its own nature.

(Marx, quoted in Lukács, 1972, p. 46)

The stratification of the problems and economic interests within the proletariat is, unfortunately, almost wholly unexplored, but research would undoubtedly lead to discoveries of the very first importance.

(Lukács, 1972, p. 79)

Marx's chief work, Lukács told us almost 100 years ago, changes direction just when he was about to sketch out a definition of class. And we are still in need of a conception that captures the fluidity, the fissures, and the complexity of the subjectivities that can be said to belong in this class or that. We claim that we are in need of a complete overhaul of our perceptual, conceptual, and linguistic apparatus if we are to provide insight into the basis on which to imagine and build networks of affiliation across national, local, and global divides and lines of race, class, and gender. We argue further that placing aspects of contemporary popular culture in conversation with the scholarly discourses of cultural Marxism can help us to do just that.

In the scene depicted above (from Thomas McCarthy's film, *The Visitor*), we see how the experiences of Zainab and Zev, illegal immigrants in New York City, barely register on the radar of White, Upper-Eastsiders, for whom the world is understood from their own solipsistic perspective alone. In much the same way as we see how the gaze and the discourse of the wealthy white woman is critiqued by Zainab and Zev, we subject the analytic apparatus of cultural Marxism to scrutiny. Reading it contrapuntally (Logue, 2005) through the lenses of cinematic and literary representation we begin to see how the units of analysis in the discourse of cultural/historical materialist revolution are incapable of encapsulating the dynamics of power at work in past and present relations of power. Juxtaposing analysis of the nostalgic and unified nationalist structure of feeling with which the neo-Marxist discourse in postwar Britain is silently aligned to the problematization of tradition we see in cinematic and literary representation provides an opportunity to (re)examine the conceptual tensions and categorical contradictions that exist within this discourse of resistance, the terms of which, as commonly deployed, seem to undermine the possibility of adequately diagnosing the (new but reminiscent of old) dynamics of power and resistance with which it claims to grapple.

Disavowing particularity (at once universalizing and pathologizing it) is an age-old strategy of domination. We see this tendency at work in the way that terms such as "tradition," "culture," "class," "power," "privilege," etc. are commonly deployed as though they weren't (each of them) riddled with complexity, contradiction, and antagonistic genealogical formation. The persistent assignment of particularism and atavism to the vast wastes of the third world begins with Karl Marx himself, as well as Max Weber and Emile Durkheim, in their particular staged-model of historical evolution of human societies. It continues in contemporary thinking in the attribution of the same scarlet letter to the new social movements and the rejection of identity politics in the writings of Marxist scholars such as Todd Gitlin (1995). This chapter restores a corrective valence to the whole enterprise of the analysis of culture. We read all of this against the troubling of tradition and the past in recent

films on the working-class subject, as well as George Orwell's (1981) discourse on tradition, power, and privilege. In the latter, the "ear-holed" working-class subject now operates on colonial secondment overseas. In reading back and forth between Birmingham and Burma a new light is shed on recombinant particularism (*There Ain't No Black in the Union Jack!*) that the analytic framework of cultural Marxism seems to have foreclosed. For to understand British cultural studies is in part to understand that Mathew Arnold's project still survives in the hearts and minds of men and women at home, and even overseas in the empire, as C. L. R. James argues in *Beyond a Boundary* (1983).

In examining the status of tradition and the past within cultural Marxism as a way of clearing a path to the future, looking particularly at the work of historical recuperation within Marxist cultural humanism and its tendencies toward the universalization of the particular, a sharp light of attention is focused on British cultural studies, its anxiety of influence, and its graven desire for plenitude and fullness of understanding of the socially and materially constructed demarcations of the modern world. One is reminded here of the definition of culture and cultural studies advanced by John Fiske (1987): "Cultural Studies is concerned with the generation and circulation of meanings in industrial societies (*the study of non-industrial societies may require a different theoretical base* [. . .])" (p. 254). Cultural studies' search for the vanishing point, the origins of consciousness and general mythologization and valorization of the industrial working-class subject, is nestled within a peculiar narrative and play of national endowment, affiliation, and ethnic and localist distinctiveness in its founding arguments and concerns. Of course, similar arguments could be made about the nationalist canalization of tradition and the localist focus of the urban sociological ethnographies coming out of the Chicago School inspired by Robert Park and his students, right down to Howard Becker and the deviance research that influenced cultural studies proponents' pathbreaking ethnographies, as Michael Burawoy has argued (Burawoy et al., 2000).

This valorization of the traditions of the industrial working class has had several consequences (beyond the mistaking of spitballs for revolution) not always adequately accessed or diagnosed to date – one being the disavowal of particularism no different in structure and tone than what could be found in the patterned variables and structural functionalism over all in the work of mainstream social scientists such as Talcott Parsons. Of course, an integral feature of the reverence for working-class traditions is the methodological overlay of field-bound ethnographic rules and the visual culture documentary impulses that flow from Bronislaw Malinowski, Evans-Pritchard, Radcliffe Brown, and Margaret Meade, and monumentalist classical anthropology into the critical sciences in media studies and elsewhere, paralleling the rise of visual culture as a whole in silent and sound film, television and radio broadcasting, and the like. As an aside, it is to be remembered that in the 1920s and 1930s it was naturalistic ethnographic research – not quantitative survey analysis – that was the dominant research paradigm in the social sciences. The dominance of survey and market research would come later when Paul Lazarsfeld crossed the open

seas of the Atlantic from Austria and joined Robert Merton at Columbia University in New York. But that is a matter for another time.

Interrogating the foundational assumptions and technical terms deployed in the discourses of cultural Marxism, we foreground the epistemological, ethical, and political implications of not investigating what it is these conceptual tools enable us to open up and what it is they foreclose. Does the concept of “class,” for example, as deployed within cultural studies research properly capture the contradictions experienced by category members in their everyday, lived existence and their class trajectories as they intersect with the new social subjects of the modern world – the diasporic “Pakis” and “West Indians” of British urban ethnographic lore (carriers of class histories of a different order)? How are the class affiliation and performative practices of Willis’s “earholes” to be understood within this paradigm, particularly when these putative class members no longer seek to align themselves with the traditions which theorists of the working class describe? Is the working-class concept equipped to theorize the collective formation of agents with shared interests as members of interpretive communities composed of individuals and fractions that may or may not share the same relation to the means of production? Should it be? And what happens to sex/gender/sexuality when class becomes the primary category of analysis? What follows is a critical conversation between foundational texts of cultural Marxism and forms of popular culture to illuminate some of these complexities captured on the big screen and in the ill-fated peregrinations of the working-class subject in modern literature (our example, here, George Orwell’s tale of an “uneducated” colonial police officer’s fateful encounter with the “native” agro-proletariat in the Burmese context as British imperial rule there waits to exhale). An effort at (re)historicizing the “tradition” of cultural Marxism, uncovering its inherent ethnocentrism, provides the framework for a brief discourse analysis of the deployment of terms like “class,” “power,” and “privilege” held together by notions of culture and tradition that are problematically monolingual and monotoned. Reading these discourses, texts, and conceptual tools contrapuntally through the lenses of cinematic and literary representation magnifies the need to reconfigure language, perception, and desire so that the conversation and transnational hybridity that is culture can take place and be grappled with collectively.

Deconstructing Demystification

A central task of this chapter, then, is to demystify the demystifiers on the problem of tradition and particularism which the classical sociologists had assured us would diminish with the advance of capitalism. The tendency to shunt particularism off to the periphery is therefore consistent with this core form of thinking. The ethnographic impulse that underlies cultural Marxism fuses action and interpretation, experience and text, worlding the world from the metropolitan center into its visible

hierarchies of class and culture. Standing at the center of this panopticon, the whole social field spreads out before the Marxist observer like a vast unscrolling map. This cartographer of the modern world measures and weighs its social distinctions with the finality of a puritan and with the fervor of what Rey Chow (2002) calls “the protestant ethnic.” In the cultural Marxist’s elective epiphany, the third world subject would virtually perish. But in this disavowal, particularism returned like a plague of innocence. Read on its own terms as a quest for scientificity, cultural Marxism divines class from the entrails of the social present and past, and ethnicity disappears. Read against the grain as a reluctant form of autobiography, the root book of cultural Marxism reveals its protagonist dressed in his solipsistic bright suit of ethnic privilege. And here, by this strategy, ethnic particularism appears. It is this deep-bodied ethnocentrism, paradoxically attached to the generalizations and transhistorical statements about the industrial working class and human societies associated with the theorizing of critical social scientists, that Horace Miner satirizes in his classic essay “Body Ritual Among the Nacirema” (Nacirema spelled backwards, of course, is “American”). Here, Miner talks about the mouth rites of the Nacirema, in the process exposing the classic norms underlying the cultural description that constituted the leitmotif of culturalist scholars writing about others:

The daily body ritual performed by everyone includes a mouth rite. Despite the fact that these people are so punctilious about the care of the mouth, this rite involves a practice which strikes the uninitiated stranger as revolting. It was reported to me that the ritual consists of inserting a small bundle of hog hairs into the mouth, along with certain magical powders, and then moving the bundle in a highly formalized series of gestures. (Miner, 1956, p. 503)

The everyday practice of brushing the teeth is elevated to the realm of magic. The magician, the social observer and his besotted humanism, are defamiliarized here. And, the anthropological gaze of the West upon the third world subject is turned back on power for an evanescent moment full of illumination.

When we look, too, at the writings and founding motives of cultural studies, we find a similar hidden subject within the text that attaches itself to the working class and hides its own anxieties and its professional updraft. When we look at the work of Richard Hoggart, or Raymond Williams or E. P. Thompson, or later Paul Willis and Dick Hebdige, we find an ethnographic Marxism alloyed to a visceral nationalism, an ethnic particularism and wish fulfillment which it denies. How else can we read the intellectual history of Williams’s *Culture and Society, 1780–1950* (1966) but as a formidable and unrelenting recuperation of the Leavisian moral sensibility and purpose of British cultural form – the dream of the whole way of life as the encoding and decoding of national ethos in the British industrial novel and literary works? Burke, Cobbett, Southey, Owen, Bentham, Coleridge, Carlyle, Gaskell, Disraeli, Dickens, Arnold, Ruskin, Richards, Leavis, Orwell! If ever there was an assertion of a national canon, a court of appeal, the breaking

out of particular cultural sensibility linked to national distinctiveness, this was one. How else is one to read Richard Hoggart's *The Uses of Literacy* (1957) with its characteristic mourning of the lost of the English working-class way of life (Morley & Robins, 1995) – its rampant nostalgia for a translucent past then in imminent dissolution? How else are we to read the brilliant E. P. Thompson, who at the end of *The Making of the English Working Class* (1980) makes the disclaimer that he was not competent to speak for any other working class than the English . . . not even the Scots or the Welsh? How else are we to read Paul Willis and his lads of Hammertown Boys who reduce the postcolonial other to the metonymic “Pakis” and “Jamaicans?” This great cauterizing reflex, this severe backward glance, was born in fact in the context of a general crisis of the relevance or irrelevance (depending on your ideological persuasion) of Western Marxism as the Soviets marched into Hungary in the 1950s and then into Czechoslovakia in the 1960s (Dworkin, 1997; Taubman, 2004). In this rude awakening from methodological slumber, British Marxist historians would disconnect from the work of international socialism, the Communist Party, and found their own distinctive theories of the origin of the British working class in the revival of working-class radical traditions (Dworkin, 1997; Hall, 1980). This working-class construct, for the subcultural theorists of resistance at Birmingham, was defined around a militancy of style, distinctive accoutrements and dress, argot and the like. This characteristically muscular construct, as Angela McRobbie (1997) would note, folded the working class into a singular, homogenous structure, powerful against its class adversaries, its semiotic chora set against the “earholes” and contemptuous and disdainful of the periphery. The power within this framework operated like a blunt instrument that was applied to the working classes and applied, in turn, like the clubbed foot of an elephant, by the working class against its ethnic rivals and latecomers from the third world; Sisyphus pushing against his enemies, all costermongers pushing rotten apples, as V. S. Naipaul would say of the donned dwellers of Oxbridge. Geoff Pearson's assessment of “Paki-bashing” in the northern English town of Lancashire underscored the vigorous tendency within cultural studies to subordinate ethnicity and race to class. Indeed, Pearson (1976) maintains “only if we enter into the heart of working-class life can we understand these beliefs and actions. ‘Paki-bashing’ is a primitive form of political and economic struggle. It is an inarticulate and finally potent attempt to act directly on the conditions of the market – whether the exchange value which is contested concerns housing, labor power or girls” (p. 69).

In its radical ethnocentrism, cultural Marxism closed off the White working class from its racially minoritized other, orientalizing the latter whether they were from Asia or the Caribbean as metonymic attachments – the “Pakis” or the “Jamaicans.” A deadly consequence of this is that the working-class subject and the nature of power were not presented in a sufficiently complex or nuanced way. Indeed, it would be left to the filmic culture and the literary culture to present more complicated views of class power and class subjects. The texts we discuss here effectively articulate complex accounts of the enlacement of class with ethnicity in a world transforming

into hyper-globalization and transnationalism. But before we turn to the filmic and literary culture for insight, let us try and spell out a little more thoroughly the nature of the conceptual tensions that stem from this radical ethnocentrism.

Revisiting the Operationalization of the Category of Class

The lack of unity and the fluidity found within different lived realities within nations and around the globe are not and cannot be contained in the concepts we have used to articulate them – concepts such as *the* working class, which have been the animating and organizing categories deployed in much contemporary “neo-Marxist” analysis. Crucial aspects of what it means to be a socio/discursively constructed subject differentially positioned in a nebulous network of power relations are overlooked when definitions of culture, class, and power involve a nationalist monologue at the expense of intercultural dialogue and exchange. Language, here, is of primary importance, for not only does it serve to articulate and delimit a set of criteria for establishing whether or not one belongs to a given tradition, or rather, where they belong in relation to it, but also it often seems to reinforce the very social structures it is invoked to subvert.

Historicizing the concept of class, for example, reveals not only that common contemporary usage of the term too often fails to adequately absorb and embrace crucial distinctions and complex variations found with in “it.” It is also the case that “class” is then disembedded from its proclaimed tradition, thereby eliding paradoxical implications of forms of resistance achieved by revolutionary discourses past and present. How, for example, is the Marxian distinction between *Klasse en sich* (class in itself) and *Klasse fuer sich* (class for itself) placed within the work of cultural Marxism? Marx theorized *class in itself* to signify those who share a common location with regard to their relations to the means of production, while *class for itself* pertained to members of a group who consciously recognize their shared predicament and common interests, actualizing their needs and desires through networks of communication and resistance by organizing around their shared conflict with the opposing class. The two contending classes here, for contemporary Marxism, included the proletariat, destined to become *class for itself*, and the bourgeoisie, incapable of formulating class consciousness beyond the pursuit of individual self-interest. What was less spelled out, however, were the dynamics, shifts, and conflicts found within *class in itself*. For when one tries to work out how factors of race, gender, and sexuality figure into the operationalization of the definition of the proletariat/“working class” *in itself*, one may be inclined to suggest that there were numerous formations and reformations of *class for itself* within the “working class” and that these variations on the theme were of less urgency for Marx (and later neo-Marxists) to articulate. Continuing in this vein, early postwar cultural studies theorists failed to track the

dynamic patterns of migration, dislocation, and rearticulation that had begun to feed into the class experience of working-class subjects in England and that brought new elements, new potential conscripts, to membership within the industrial working class. They had failed to adequately assess the changing map of spatial relations and the interior realities of British urban life itself as part of a broad-scale set of effects brought on by late capitalism – effects that were now stalking modern industrial societies. It seems that, here, the seeds of an under-theorized dynamic involving the mis(sed)diagnosis of the impact of networks of global communication, movement and migration of economic and cultural capital, and the amplification of representations and images had been effectively sown. What was nurtured instead was an ethnic and nationalist myopia planted firmly in the soil of an agrarian England transcoded onto the urban setting. The nurturing work of much of the historical recuperation of British radical traditions such as that of E. P. Thompson or Raymond Williams always, then, had a backward glance – an eternalist sense of *le temps perdu*, *los pasos perdidos*. Time and space essentially stood still. And, for instance, Willis would find in the Hammertown Boys School in *Learning to Labor* (1981) that the progeny of the working class grew from seedlings that were planted by their fathers on the shop floor. This backward glance – a nostalgia for the past, a nostalgia perplexed by the present – rendered problematic the entire analytical apparatus of the cultural studies discourse on class and change. In affirming the class essence of the industrial proletariat, this nostalgia had a particular methodological effect concerning class analysis as deployed within cultural studies: a tendency to gloss over contradiction, variation, and multiplicity.

Is this affirmation of traditional essence and the latent but virile proposition of the indivisibility of the working class, in a sense, what Hebdige (1979) accomplishes by writing of reggae and punk as seemingly equivalent subcultures? Rather than emphasizing these formations and modes of resistance as mutually constitutive, reggae figures in as an expression that culminates in the response of the punks. Neither is reggae considered countercultural or as more than an articulation of style, despite the fact that Hebdige cites it as having created its own language, religion, and vision of the future. Are we to understand the white and black factions described herein as manifestations of *class for itself* contained within the “*working class*?” How are the lived realities and cultural achievements of the diaspora/Black Britain subsumed by this move? Does it contribute to the idea that tradition and culture can be claimed as the moorings of an ethnically invisible yet distinctive group that remains forever threatened by that which it codes as deviant?

And what happens if we take seriously Michel Foucault’s (2002) assertion that the concept of class struggle evolved out of (was extracted/de-historicized from) the discourse of race war/race struggle? Foucault’s genealogy of the discourse of history reveals that racism is imbricated in revolutionary thought coming from the moment when the discourse of race struggle was being transformed into revolutionary discourse, where the state functions no longer as an instrument that one group uses against another: the state becomes the protector of the integrity, the superiority, and

the purity of the race. Foucault reminds us that the concept of class struggle is found first in the discourse of the French historians – in the works of Augustin Thierry, Guizot, John Wade, and others. Thierry is defined as the father of the “class struggle,” used to replace the notion of “race struggle.” The effort to recode race struggle into class struggle is read as a manifestation of the shift in focus on race as existing whenever one writes the history of two groups that do not have the same language, to the term “race” becoming pinned to a biological meaning. This shift in race as linguistic difference to race as biological is what will become actual racism. This racism, according to Foucault, takes over and reconverts the form and function of the discourse of history, which was hitherto a discourse on race struggle/race war. Racism is born then of the shift in historical discourse, once reporting on the theme of historical war with its battles, invasions, victories, and defeats, to the recording of history with a new post-evolutionist theme of the struggle for existence by that of a society that is biologically monist, but which is (needs to be) threatened by a certain number of heterogeneous elements it deems not essential to it. Racism, then, at its inception, becomes manifest in the idea that foreigners have infiltrated society, which is to be safeguarded from deviants, who serve to foreground class conflict by being coded as factors which complicate it.

Foreclosing examination of its own origins, disembedding the discourse of class conflict from the discourse of race struggle impairs analysis of the complex organization of hierarchical social relations and resistance to them. Not only does the term “class” commonly function as though it were a static, impermeable category with an invisible ethnically particular tradition, but it fails to connote the actual strategies through which social subjects forge collective oppositional identities from the grounded pragmatics of cultural hybridities. Rather than attending to the centrality of sexual orientation, gender, and ethnic affiliation in cultural formations and transformations, in creating networks of communication and association, these categories are too often treated as complications contained within the already established organized relations to the means of production. And while the insights and methodological breakthroughs of cultural Marxism are important, like the emphasis on the popular imaginary, style, and other forms of often-overlooked resistance, might the struggles and forms of active resistance of what cultural Marxism lauds as the “working class” be better described as strategies developed by those differentially positioned in a complex web of power relations? It seems as though some of these overlooked dynamics of power and resistance are better captured in the very popular culture that cultural Marxism sought to interpret. But, while cultural Marxism begins to analyze popular culture, does it really converse with it?

It is both in *The Full Monty* and *Billy Elliot* that we see the working class, the “foot soldiers of modernity” as Willis (2005, p. 461) calls them, metamorphosing in the transitional light of globalization, and the tragic programs of deindustrialization and post-Fordism that radically transform the labor market and labor process from hard to soft, from materiality to immateriality, from the decaying manufacture of the metropole to the export processing zones overseas in Asia, Latin America, and

the Caribbean, from hard industry to flexible information, from the working class cast in the center of history to the mass appearance of the proletarianized, temp. working cognitariat (Jencks, 1996; Klein, 2001). Do the terms of the cultural studies working-class discourse on resistance traditions capture such complexity? And, how are these complexities of tradition, class, and power addressed in the filmic and literary culture?

New Frames of Reference and Affiliation in Cinematic and Literary Production

And for what? . . . For what now? . . . What for? So we can just open the flood gates and let all come in and say: "Yeah, come on! Come in! Get off your ship! Did you have a safe journey? Was it hard, was it? Hey, here is a corner. Why don't you build a shop? Better still, why don't you build a shop and a church? Follow your own f. . .ing religions. Do what you want. . . . When there are single f. . .ing parents out there who can't get a f. . .ing flat and they are being given to these . . . and I am going to say it . . . I am going to say it people . . . because you are going to have to hear it . . . We are giving these flats to these f. . .ing Pakis, right? . . . who have got 50 and 60 in a f. . .ing flat on their own. Right?

(From *This is England*)

BILLY'S DAD: Ballet?
 BILLY: What's wrong with ballet?
 BILLY'S DAD: What's wrong with BALLET?
 BILLY: It is perfectly normal . . .
 BILLY'S DAD: Perfectly NORMAL? . . . For girls, not for lads, Billy . . . Lads do football, or boxing or wrestling . . . not frigging ballet!
 BILLY: What lads do? . . . Wrestling? . . . I don't see what's wrong with . . .
 BILLY'S DAD: Yes you do!
 BILLY: No, I don't!
 BILLY'S DAD: Yes you bloody do! . . . Who do you think I am?
 BILLY: What are you trying to say dad . . .

(From *Billy Elliot*)

Contemporary filmic representations often offer complex and nuanced accounts of the transforming circumstances of working-class lived and commodified existence, revealing fault lines of contradiction and multiplicity. Indeed, the vaunted traditions and the folkways of the past so celebrated in the cultural studies ethnographic portrayal of the proletariat from Hoggart to Willis and Hebdige now hang like proverbial dead weights upon the new working-class subject. What the British White working class reluctantly has to face is the late-modern context of postindustrialization and the collapse of the material basis of White working-class identities that were grounded

in shipbuilding, auto manufacture, and coal mining. Many of these industries moved overseas as England was perhaps the first developed country to feel the full brunt of the reorganization of capitalism and the neoliberal reorientation of its government, under Margaret Thatcher (Nayak, 2003; Willis 2005). Thatcher brutally disrupted working-class organizational collectivities and set in train a social and spatial landscape in which the visible markers of working-class identity situated in the factory would be forever uprooted. This is the world of Shane Meadows's provocative film *This is England* (2007), about a group of skinheads who are trying to make sense of the postindustrial world of immigrants, chronic unemployment, and constrained futures. England – as the principal skinhead character, Combo (Stephen Graham), notes above – has changed.

Billy (Jamie Bell) of the film *Billy Elliot* (2000) is also sharply aware of a new, postindustrial world coming into being. For him, the shop floor and the coal mines belong to a distant past and now exist as straitjackets constraining the desires of youth. Billy, instead, chooses a future in the Royal Ballet, in dance, rather than in the Victorian role of male provider of the coal mines and the deunionizing labor of north Durham, England. And in the end, when his latecomer dad attends his performance, he gets to see his son leap and soar, literally and metaphorically, out of the terms of existence that fashioned his life. There is no possibility of return to the past, just the flatlining of traditions and ephemeral revision of hierarchy of cultural distance.

And while Billy's doing ballet demonstrates the falling and collapsing (the ephemerality) of tradition – as well as the ability and desire to leap out of it with passion and grace into creative self-transformation – what does our youthful subject have in common with that weary and worn-out working-class subject featured in the spotlight of much media in the mainstream as well as within the scholarly and political discourses of the radical left? These portray the young White (presumably straight?) “working-class” male as triumphant; the battle scars, struggles, and defeats of the racially and reproductively marginalized others (always present even in their absence) are subsumed in the spotlight of his victory over those forces that constrain and oppress *him*. We can see here how the construct of the working class constricts those who find themselves in it and casts out those who provide the other side of the boundary line. For it is not just the capitalists that constrain him and over whom he seeks to triumph – there are so many more lines drawn in the sand.

Providing for Billy an unnamed but central aspect of his co-authored identity, Debbie Wilkinson (Nicola Blackwell), the daughter of his dance teacher, his potential friend (or rather girlfriend), could have had a voice and purpose in life beyond becoming his worshipping subject seeking to possess him for herself at all costs. This one visible female counterpart is vanquished in the representation. Rather than being portrayed as a potential ally with agency, she is pitted against Billy, so they remain alienated from each other as well as the structures that define and code them. Moreover, the way Whiteness functions (for anyone possessing it) as property, providing a special but spectacularly hidden ethnic particularity, cultural capital, and symbolic power that translate into material profit, remains unexplored. But the depiction

of the “traditional” masculinist working-class subject united against an identifiable enemy with similarly positioned others is indeed challenged here, opening the door for analysis of the underground economies of national identity, sexual orientation, and ethnic affiliation.

In a somewhat different way, but with a similar intensity in the uprooting of the past and tradition, Gurinder Chadha’s *Bend It Like Beckham* (2002) is a refreshing depiction of the flatlining of tradition, but this time the star of the show is a young Asian girl, Jesminder. Jess is the youngest daughter in a rather orthodox Sikh family living in Britain who struggles to participate in family tradition while at the same time pursuing her dream to “bend it like Beckham.” She is an agile, wily football (soccer) player who feels that she may be destined only to kick the ball around in parks when no one is looking. She nevertheless manages to be spotted by Hounslow Harriers women’s team, where she soon becomes a star – until her parents find out and ban her from playing. Her mother scolds her: “Who’d want a girl who plays football all day but can’t make chapattis?” Willing to gender bend on some level (but oblivious to the ways in which her sexual orientation has been questioned by her best friend’s mother), her father eventually comes around, preferring his daughter’s happiness to the confines of “tradition,” and we are presented with wonderful depictions of his daughter’s ability to participate with agency in seemingly separate traditions laid out side by side.

Complications of sex/gender/sexuality collide in Deepa Mehta’s *Fire* (1996), where same-sex desire overrides the dictates of tradition for two Indian housewives whose “trial by fire” signals the purity of their new-found love that dares to but cannot speak its name, for “there is no word to describe what we are to each other in our language,” utters Sita (Nandita Das), the more rebellious of the two.

Again we see notions of the past and the “tradition” of the “working class” challenged when the six unemployed steel workers of *The Full Monty* (1997) form a male striptease act, literally defrocking and leaving nothing but their Poulantzian number plates on their backs. The Full Monties of Sheffield literally search for, and then abandon, their iron-mongering past in the decayed industrial rubble of the once-thriving, manufacturing city of Sheffield – shelving their overalls and dungarees for the regular beat as male strippers.

Going further back in filmic representation, we must not forget the telling sentiment: “We’re not English, we’re Londoners.” This is expressed by Sammy in *Sammy and Rosie Get Laid* (1987) after numerous depictions of what might have made Hoggart turn in his grave: Sammy is depicted doing seven different things simultaneously – eating fast food, watching the news, listening to the radio, flipping through a porno magazine, sipping beer, and snorting a line or two of cocaine while conversing with his father, trying to unwind. We have here a depiction of the shifting and fragmented nature of co-authored identities and the processes of disidentification with the ethnic particularity of the “Nation.” It is articulated as a refusal of cultural heritage even as Sammy vigorously indulges in what it has to offer. An alternative representation of desire, romantic/domestic partnerships are pursued here, as well as the building

of an alliance across class (as conceived or portrayed in its strictly material sense) lines. The confines of compulsory heterosexuality and notions of ethnic purity and distinction are subverted as alliances and love affairs transpire between members who are differentially placed within the categories of race, class, and sexuality. Depictions of interracial and homoerotic desires are indeed a sight for sore eyes in this film and in the depictions of love and desire outside the confines of heteronormativity in *My Beautiful Launderette*, which is – we can't forget – the space owned by the “Pakis” who are the employers and lovers of White working-class Johnny.

And with an eye to the under-theorized pathologies of imperial domination, we get a glimpse in these films also of the perils of privilege lived out by its perpetrators. Ravi, for example, Sammy's father, whose involvement in British imperialism leads him to commit suicide after he finds that relocating to Britain fails to drive the brutal memories from his mind of how perhaps his own involvement in maintaining his notion of tradition contributed to his complicity with colonial abuse. Notably, the wealth and riches he received from his affiliation with the colonizers provided neither luxury nor peace of mind, alienating him from his family. They cried, but did they mourn his death? The very privilege promised by tradition seems to have driven him to take his own life, not celebrate it. But where is the guilt or the consciousness of the White colonialist? Though not depicted here, the film helps to demonstrate that thinking of class merely in terms of one's relationship to the mode of production does not allow for the building of alliances outside shared relationships to the means of material production (often more a product of the abstract “in itself” formulations of neo-Marxists scholars). *Sammy and Rosie Get Laid* thus offers an excellent example of what networks of affiliation and interpretive communities could look like.

Oppositely privileged individuals both of whom are alienated from their assigned class/social function are portrayed in film, demonstrating once again the way in which crucial aspects of lived social relations form and reform with those that may or may not share the same relationship to the means of production. As Paulo Freire would be inclined to point out, both “oppressor/oppressed” are alienated, dehumanized in relations that prize hierarchy and cultural/traditional superiority. We see this in the lives of White working-class Rita and her professor (Frank), her fleeting mentor, in *Educating Rita* (1983). Both are disillusioned by the promises of becoming offered in dominant ideologies – aspiring to cross over the confines of their class distinctions. We get a sense of the ways in which identity is not a finished product one is bestowed with at birth, but a project always in process, an ongoing ever-changing conversation and exchange with others.

Filmic representations such as these depict the world of change driven by consumer durables. The logic of mobile privatization that made Hoggart so uncomfortable has followed a relentless line to the disembedding of the lads (all that is left is resentment, as Lois Weis [1990] and Michelle Fine and Weis [1998] so effectively underscore). And, the incursions and the blowback of Empire, cell phones and mobiles, smart TVs and remotes, and the musical language of hip hop or Banghra or dance hall now course through and mark the new constantly disembedding

territory of the Hammertown boys, the “lads” – a flower, an orchid, a rhizome blooms viscosely in defiance of the grim reaper of urban space.

Narrating Class and Tradition in the Literary Imagination

Then he said, “On my travels I visited an Indian tribe known as the Hopi. I could not understand them, but in their company they had an old European man, Spanish, I think, though he spoke English to us. He said he had been captured by the tribe and now lived as one of them. I offered him passage home but he laughed in my face. I asked if their language had some similarity to Spanish and he laughed again and said, fantastically, that their language has no grammar in the way we recognize it. Most bizarre of all, they have no tenses for past, present and future. They do not sense time in that way. For them, time is one.” The old man said it was impossible to learn their language without learning their world. I asked him how long it had taken him and he said that question had no meaning. After this we continued in silence.

(Winterson, 1989, p. 154)

Like cinematic representations, the literary imagination troubles notions of tradition, power, and privilege, revealing those dynamics of power and privilege that seem to be foreclosed in scholarly discourses of working-class resistance. Here again, as Benjamin (2006a, 2006b) argues, the critical challenge of the subaltern scholar is to read aesthetic form back into the social relations of material production and the fractured nature of contemporary social life. Orwell, for example, presents the working-class “earhole” or lower-middle-class actor “divided to the vein,” conflicted to the bone (a point that Derek Walcott makes in his famous poem “Far Cry from Africa” [1986, p. 17]). As Uma Kothari (2005) has told us, many of the colonial bureaucrats who went out to the colonies were often of working-class or “earholed” backgrounds, sponsored up to the public school – Eton or Harrow or whatever – and deployed to the imperial periphery with all their hang ups. Read against this phalanx of national assertion, George Orwell (1981) presents a picture of the lower-middle-class subject operating overseas, confronting the periphery inhabitant on his native soil, in a different light – more internally divided, more complexly linked to England and Empire, more uncertain about self and role in the elaboration of Britishness. The ethnographic lens now puts the Western actor under the microscope. Orwell portrays the everyday negotiation of class and power in the imperial outpost of Burma through the mediation of modernizing energies and subaltern subversions (“weapons of the weak”), the anticipation of the waning of Empire and the dubiousness of civilizing missions abroad.

Orwell’s story draws on his experience as a colonial officer. It concerns the angst of an environmentally conscious, uncertain British police officer who, egged on by a crowd of natives to shoot a rogue elephant, compromises his own agency and his

hegemonic subjectivity. The narrator/police officer does not want to shoot the elephant, but he feels compelled by the Burmese agro-proletarians and peasants, before whom he does not wish to appear indecisive or cowardly. The situation and events that Orwell describes underscore the hostility between the administrators of the British Empire and their "native" subjects. However, at another level, it is a deep examination of power. It also foregrounds what the anthropologist James Scott calls the "weapons of the weak" (Scott, 1985). Here the native is not the butt of Paki jokes for the lads or the source of a Black cultural economy of symbols for the Punks.

Orwell problematizes power and the agency of so-called dominant subjects, carefully depicting the colonial situation as one in which the "subjection of the ruled also involves the subjugation of the ruler," showing us how "subjects of colonies controlled rulers as much as they were controlled by them" (Nandy, 1983, p. 39). Plagued by divided consciousness, unable to act in accordance with his own intuition, the protagonist is tormented by guilt, hatred, and fear, and forced to suffer the felt contradictions of his precarious position "in the utter silence that is imposed on every Englishman in the East" (Orwell, 1981, pp. 148–149). Having decided long ago that "imperialism is an evil thing," this colonial official claims to be on the side of the Burmese population but feels "stuck between the hatred of the empire" and "rage against" the villagers who try to make his job so utterly impossible. One part of the official, we are told, views British rule as "an unbreakable tyranny" clamping him down, while the other part of him feels that the "greatest joy in the world would be to drive a bayonet into a Buddhist priest's guts" (Orwell, 1981, p. 149). These feelings, we are told, are the "normal byproducts of imperialism" (p. 149). And, while it is certain that the torment and suffering of those on the other side of the foul-smelling "lock-ups" could never be equivocated, the dominant subject in Orwell's narration is clearly not enjoying the promise his "privilege" provides.

Challenging simplistic notions of the ways in which power operates and who creates and belongs to the "British" tradition, on the most telling event of the day in question we learn that the colonial official is far from being decisive, all-powerful, fully authoritarian, or in control. Rather, he feels like an "absurd puppet," a "hollow posing dummy" unable to do that which he most desires. Having been ordered to find a work elephant that was wreaking havoc about the town in which he was posted, he follows his orders, armed and ready to serve and protect. He sets off in pursuit of the rogue elephant but is met with sly resistance from the villagers, who claim neither to have seen the elephant nor even to have heard of its havoc, though clearly standing right there in its midst. This non-cooperation on the part of the "helpless," unarmed Burmese population was yet another "normal" element of daily life one counted on as a colonial official, he adds. After almost giving up on his search, thinking the whole thing to be "a pack of lies" (p. 150), the narrator finally stumbles upon the large beast's most recent victim. The official spots the elephant in the distance and halts momentarily: "As soon as I saw the elephant I knew with perfect certainty that I ought not to shoot him" (p. 151). "Moreover," he adds, "I did not in the least want to shoot him" (p. 152). He decides that the best thing to do is to keep

an eye out for a while to ensure the elephant does not turn savage again, then go home for the day. But then he sees the crowd:

I looked at the sea of yellow faces above the garish clothes – faces all happy and excited over this bit of fun, all certain that the elephant was going to be shot. They were watching me as they would watch a conjurer about to perform a trick. They did not like me, but with the magical rifle in my hands I was momentarily worth watching. And suddenly I realized that I should have to shoot the elephant after all. The people expected it of me and I had got to do it; I could feel their two thousand wills pressing me forward, irresistibly. And it was at this moment, as I stood there with the rifle in my hands, that I first grasped the hollowness, the futility of the white man's dominion in the East. Here was I, the white man with his gun, standing in front of the unarmed native crowd – seemingly the leading actor of the piece; but in reality I was only an absurd puppet pushed to and fro by the will of those yellow faces behind. I perceived in this moment that when the white man turns tyrant it is *his own freedom that he destroys*. He becomes a sort of *hollow, posing dummy*, the *conventionalized figure* of a sahib. For it is the condition of his rule that *he shall spend his life in trying to impress the "natives,"* and so in every crisis he has got to do what the "natives" expect of him. *He wears a mask, and his face grows to fit it.* I had got to shoot the elephant. (Orwell, 1981, p. 152, emphasis added)

This is no simple matter for the official, who repeatedly insists, "I did not want to shoot the elephant" (p. 153). Knowing with perfect certainty what he *ought* to do, he looks again at the crowd and he reflects that there "was only one alternative" (p. 154). He loads the cartridges into the rifle and fires. A slow and agonizing death tortures the struggling, gasping elephant. The official is tormented by the sight and the need to keep shooting, continually failing to put the beautiful living being out of the misery he has inflicted upon it.

The privileged subject here cast is condemned to conform to a tightly scripted code of conduct which he does not fully understand. Three metaphors from the story – the gun, the gaze, and the mask (Logue, 2004) – serve as useful devices with which to depict what Aimé Césaire (1972) termed the "boomerang effects of domination." The gun symbolizes the moment of usurpation as one in which the police officer's imposed superiority coerces him to be what he has forced the other to see him as. Paradoxically, the instrument through which he performs his fantasy of superiority becomes the vehicle through which he suffers his own agentic demise. Unable to affirm his freedom, the dominant subject finds himself sentenced to an unending struggle for status and justification symbolized through the inescapable look of the Other. This gaze represents the instability and precariousness of his usurpation, his becoming a victim of his own unconscious – riddled with guilt, internal fears, and anxieties. In the desperate attempt to shield against this hideous onslaught of unruly emotion and external threat, he projects them onto the other, who now constitutes that which he most needs to defend himself against. The mask signifies the onset of his own dehumanization, for in wearing it, he can only reach for the gun. A self-destructive vicious circle is begun. The "posture of absolute

domination" (Theweleit, 1989) adopted by Orwell's (1981) "hollow, posing dummy" (p. 152) and the processes through which he brings about his own destruction, help to illuminate the way in which culture is a conversation and not the final property of an ethnically superior tradition. How are these tensions grappled with in neo-Marxist cultural analysis?

What do the imminent deaths of the elephant, Sammy's father (*Sammy and Rosie Get Laid*), and the hopes "traditional" parents (*Billy Elliot*) have for their children signify? Could it be that with the death of the subject lies the death of tradition, an imperial tradition on the wane? And isn't it the case that Billy Elliot's Alzheimer's grandma stands in her dream-like silence as the scrambled riddle of past attachments, past associations and feeling? Do our perceptual and linguistic apparatuses allow for the articulation of the complexities of lived social relations and networks of affiliation?

Conclusion: The New Imperatives of Globalization and the Predicament of Cultural Studies

Social science categories are becoming zombie categories, empty terms in the Kantian meaning. Zombie categories are living dead categories, which blind the social sciences to the rapidly changing realities inside the nation-state containers and outside as well.

(Beck, 2002, p. 24)

As a consequence of the new driving logics of globalization and the information age articulated most profoundly in the workings of "flexible capitalism" (Bauman, 2008; Hortiguera & Rocha, 2007; McCarthy, Pitton, Kim, & Monje, 2009; Nayak, 2003; Schiller, 2003, 2010; Sennett, 2006, 2008), all late-modern institutions, all late-modern forms of association and affiliation are coming under the banner of new identities. These dynamics associated with globalization (the rapid and constant dispersal of cultural and economic capital across national boundaries, the intensification and rapidity of movement and migration of people across borders, the amplification of electronic mediation and the work of the imagination of the great masses of the people) reveal themselves in what Zygmunt Bauman and Richard Sennett describe as a general lightness of being or liquidity of all social relations and social arrangements of late modernity. Whether one is talking about the general trend of multinational corporations such as Addidas, Nike, Rebok, and Microsoft toward what Naomi Klein (2001, 2007) calls "immateriality," as advertising, branding, and R&D displace the emphasis on inventories of products as the primary orientation of these juggernaut commercial institutions; whether we are talking about the new international division of labor in which the production, distribution, and circulation of goods and services are being coordinated over enormous distances, numerous nations and markets; whether we are considering the new terms of circumscription of the role of the state redefined by the new expansive encroachments of supranational

organizations such as the World Trade Organization, World Health Organization, and the barrage of accountability instruments such as the Programme for International Student Assessment now bearing down on national systems across the world; whether we are talking about new synchronicities of culture, the disembedding of forms of life and meanings of style from one setting and their transplantation into another; whether we are talking about the decline of theodicy, meaning, and the control over craft in all forms of late-modern labor processes (intellectual labor and the organization of knowledge not excepted) – the relentless logic of the recasting of the modern world is proceeding and accelerating at a blinding pace.

It is these developments that have thrown social science research off its collective bearings as contemporary scholars struggle to make sense of the rapid changes fueled by transnationalism and globalization (Beck, 2008). In this respect, the emergent field of cultural studies is also decentered. Cultural studies analysis in its treatment of class and tradition has been overtaken by events. It seems the perceptual/conceptual/linguistic apparatus of sociocultural analysis on the whole is now unable to diagnose the global predicament we are in, seemingly reinforcing the very structures we seek to subvert. Our entire perceptual, conceptual, and linguistic apparatus is in need of overhaul as we come to recognize the rise of networked societies in which traditions, affiliations, “cultures” (subcultural or not) are now cast off from the moorings of the final property of any group. There has been a flattening out of cultures and traditions, as these are now more integrated into the global expansion of markets and flexible models of production of capital pursuing new sites of value in ever-increasing alienated contexts.

We have reached a stage in this new millennium where the old “conflict” versus “consensus” metaphors, “your traditions versus mine” do not seem to apply. Instead of models based on conflict and resistance, increasingly, social groups are being defined by overwhelming patterns of transnational hybridities; new forms of association and affiliation that seem to flash on the surface of life rather than to plunge deeper into some kind of neo-Marxist substructure. This new model of power could now be called “integration.” It does not have a negative pole. It is what Foucault describes as a “productive” not “repressive” model of power. It articulates difference into ever-more extensive systems of association, flatlining the edges of culture into a pastiche of marketable identities, tastes, neuroses, and needs processed through the universalization of the enterprise ethic. It lays traditions down side by side, layering them in ever new ephemeral patterns and intensities – whole elements and associations given in one place can be now instantaneously found in another. Paul Willis’s nationally and geographically inscribed “lads” are now being replaced by Jenny Kelly’s (2004) Afro-Canadian youth who are patching together their identities from the surfeit of signs and symbols crossing the border in the electronic relays of US television, popular music, and cyber culture. Post-apartheid South African youth now assign more value to markers of taste – Levi’s and Gap jeans, Nikes or Adidas, rap or rave – than ancestry and place in their elaboration of the new criteria of ethnic affiliation (Dolby, 2001).

All these developments are turning the old materialism versus idealism debate on its head. It is the frenetic application of forms of existence, forms of life, the dynamic circulation and strategic deployment of style, the application of social aesthetics that now govern political rationalities and corporate mobilization in our times. The new representational technologies are the new centers of public instruction providing the forum for the work of the imagination of the great masses of the people to order their pasts and present and plot their futures. They are creating instant traditions and nostalgias of the present in which our pasts are disembedded and separated out as abstract value into new semiotic systems and techniques of persuasion, new forms of ecumenical clothing that quote Che, Mao, Fidel, and Marx, and "revolution" in the banality of commodified life – the publicity of one brand of dish-washing liquid as having "revolutionary" effects is just one good example of the brazen rearticulation of terms and traditions in the brave new world in which we live. Who now owns the terms that define the authentic traditions of radicalism that inform our works? Who now has final purchase on the terms "resistance," "revolution," "democracy," "participation," and "empowerment?" The massive work of textual production is blooming in a crucible of opposites – socially extended projects producing the cultural citizen in the new international division of labor, in which the state may not be a first or the final referent.

Naomi Klein (2001) reminds us ultimately of this radical disembedding. Spadina Avenue, the garment district of Toronto in the 1930s, is now in postindustrial limbo and a center of a masquerading consumerist heaven. Its transformation to its new millennial identity of stylish high consumption owes its genesis to the cruel juxtaposition with Jakarta and the flight of its garment industry to Indonesia. And while there is not much need for overcoats on the equator, "increasingly," according to Klein (2001), "Canadians get through their cold winters not with clothing manufactured by the tenacious seamstresses on Spadina Avenue but by young Asian women working in hot climates [. . . making] anoraks and ski jackets from Indonesia" (p. xvi).

The outlines of this new global context have precipitated a crisis of language in neo-Marxist scholarly efforts to grasp the central dynamics of contemporary societies, bearing on the question of "tradition" and the centering term "class." The latter developments have led to a depreciation of the value and insightfulness of neo-Marxist analysis in our time – old metaphors associated with class, economy, and state ("production," "reproduction," "resistance," "the labor–capital contradiction") are all worn down by the transformations of the past decades in which the saturation of economic and political practices in aesthetic mediations has proceeded full scale (Klein, 2001). The scale and referent for almost all of these organizing terms of analysis had been set and bounded at the nation, defined in the localist anthropological/ethnographic terms of "tradition," "ritual," and "culture" understood on the localizing plain of community, ethnic group, society, and so forth. The new circumstances associated with post-Fordist capital – the new international division of labor, movement and migration, and the amplification of images and the work of the imagination of the great masses of the people, the great masses of our times, driven forward

by computerization, the Internet, popular culture, etc. – have cut open particular traditions, spilling their entrails around the world.

These logics have unsettled the processes of the social integration of modern subjects into late-modern institutions. The modern working-class subject is being remade and reproduced in a context in which the relations between government, society, the individual, and market forces have undergone profound transformations and reorganization on a global scale. What is working class in itself and for itself in the new millennium is now splintered across a wide global arena of export processing zones in the third world and the temp. working and the chronically unemployed in the soft sectors of the postindustrial service economies in the metropolitan centers. A wide framework of “graduated sovereignty” (Ong, 2006, p. 7) therefore defines this new condition of the international division of labor, demanding new terms of analysis that require cultural studies proponents to grasp the rise of transnational circumstances in the new postindustrial condition of alienated labor, hyperconsumption, and prosumerism.

Making Media Production Visible

Vicki Mayer

ABSTRACT

This introduction looks at the history of media production research, seeks axes for the interdisciplinary theorizing of media production, and offers a discussion of the current conjuncture for research on media production. From there I outline the rationale for the volume, its organizing themes and sections.

Media production is frequently the most invisible aspect of our relationships with the media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how. The reader who is scanning my words now probably has not considered the creation of the text – the formation of the argument, the production of the book, the reproduction of the book in print and digital formats – much less the politically liberal context for my authorial voice, the economic drives of the academic publishing industry, the continuing culture of individual authorship in the humanities, the ethics of mental labor, and so on. This volume attempts to foreground some of these issues in the study of media.

Even in the annals of scholarship on the media, production and producers frequently take a backseat to other, more primary concerns about the effects of technologies or contents, consumer preferences and user access, or the functionality of the media for democratic or cultural spheres. Although many canonical critiques of mass media addressed production in their criticisms of propaganda (Lippmann,

The International Encyclopedia of Media Studies, First Edition.

1922), mass consumerism (Horkheimer & Adorno, 1972), gender (Mulvey, 1989), or racial representations (Du Bois, 1926), subsequent generations have distilled only select fragments about content and consumption from these holistic arguments. At the same time, production mattered to early scholars of media. Some thought about the role of media producers in democratic governance, advocating for media production policies and rules that would foster an informed and educated public (Cooley, 1918; Dewey, 1927; Follett, 1924). Others aimed to understand production processes in order to hone them for efficiency and effectiveness (Lasswell, 1927; Lazarsfeld & Stanton, 1979; Schramm, 1964). Still others (Habermas, 1991; Schiller, 1969; Thompson, 1994) considered the mode of production itself as indicative of changes in the popularization and industrialization of culture – the long revolution, according to Raymond Williams (1961). What the authors of the following chapters share is the effort to foreground media production as central to answering questions about political governance, economic processes, and cultural transformations.

In this introduction I offer structure and agency as axes for the interdisciplinary theorizing of media production. I do not pose these as exclusive categories. There have been a good many debates over what media production research is based on: false dichotomies between administrative and critical research in the 1970s and 1980s (Lazarsfeld, 1941; Smythe & Van Dinh, 1983); political economy and cultural studies in the 1980s and 1990s (Garnham, 1995; Peck, 2006); as well as current comparisons of what has been called media industry studies and production studies (Havens, Lotz, & Tinic, 2009; Mayer, Banks, & Caldwell, 2009). Indeed sophisticated media production research draws on all of these traditions. This section is followed by discussion of the current conjuncture for research on media production. From there, I outline the rationale for the book through a more detailed investigation of its organizing themes and sections.

As with any collection that claims to represent the world from the armchair of the editor, there are undoubtedly numerous lacunae in the following pages. Although the chapters presented here span a range of political economies, industries, countries, and peoples, this volume does not claim to cover all the topics that could be germane to the study of media production. The digital age, for example, has transformed our phones, cars, appliances, and even our clothes into media that communicate with us, with the world, and with each other. Nor does this volume cover every possible method. In particular, some forms of economic and statistical sociological analysis have been omitted from the present book, not only because of the specialized languages of these fields, but because they are not representative of a scholarship engaged with the questions of politics, culture, and society that define media studies.¹

Structure and Agency in Media Production Research

The word “production” infers both a basic human quality and a social process. The history of media production charts the ways humans have transformed their abilities

to produce and to mediate their thoughts, as well as the ways these are embedded in larger societal transformations. Students of media production, by and large, have emphasized the relationship between human agency and social structures in the making of media contents, whether this is creating news, recording a song, generating a commercial genre, or marketing media technologies.

By “social structures” I am referring to patterns developed in modern societies – such as the bureaucratic state and industrial capitalism. These structures frame media production within markets and nation-states. In many societies, media production has been structured by a bureaucratic state that manages people and their institutions in order to accumulate capital, organize citizens and workers, and maintain a monopoly over the use of force and violence. Modern social structures for media production thus are steeped in histories of colonialism and imperialism (Mattelart, 1978; Schiller, 1969; Tunstall, 1977). At least since the nineteenth century, writers have focused on the ways media production may help or hinder nation-states in accomplishing their goals. The sociology of the production of culture, consolidated by the late 1970s, systematized the study of media production through six facets: technology, law and regulation, industry structure, organization structure, occupational career, and market (Peterson & Anand, 2004, p. 313). Structural critiques of the production of media technologies, the commercialization of culture, the disfranchisement of media labor, and the routinization of production have implicated the roles of the state and market in what is called the military industrial complex for media production (Schiller & Phillips, 1970). The emphasis on structural frameworks for media production has tended to assume that industrialization is the singular starting and ending point for understanding media production, its organization and operations, and producers’ roles, activities, and motives.

As a result, in accordance with a generalized critique of capitalism, scholarship on media production has tended to focus on the media with the greatest reach – for instance film and television – from the most centralized production locations – such as Hollywood or London – and with the most concentrated labor forces; and on professionals such as journalists. This is a feature of media studies in general. As communication historian John Nerone (2003, p. 102) notes: “If any media technology is proto-industrial, the age of industrialization marks the key moment for the formations of the organizations we now think of as the mass media.” The overwhelming tendency to focus on mass media production, for example, has resulted in fragmentary accounts of amateur media production such as scrapbooks (Tucker, Ott, & Buckler, 2006), home movies (Zimmermann, 1995), community media production, for instance indigenous media making (Wilson & Stewart, 2008) or, more recently, zines (Duncombe, 2008). While these types of media production are not outside of industrialization, they highlight the need to examine the social structures that do not always conform with the processes inferred by industrialization, for example through their embedding in domestic life, their collective ownership, or their participatory rules for producers and consumers. Indeed these structures have become more important to the understanding of forms of media

production not sponsored by the military industrial complex (see Spigel, 2009; Turner, 2008).

If the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates them in the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers. The invention of different forms of media professionals, from the advertising professional (Lears, 1994) to the professional jazz musician (Becker, 1951), is a prime example of the modern subjectivities associated with media production institutions and practices. A good deal of scholarship on media production has examined the ways people interact to create these institutional sectors of the labor force, systematically developing routines for creating, distributing, marketing, interpreting, and instructing their practices (Ettema & Whitney, 1982; Hirsch, 1969; Turow, 1984; see also Ryfe in this volume). Although this work can be descriptive or critical in nature, the focus on the joint actions of people within media production and with roles in it stands in contrast with a set of texts that focus on the agency of singular individuals involved in production. Quasi-biographical if not autobiographical, the earliest accounts of media production were frequently offered by people involved with media production as journalists (Park, 1923; Steffens, 1931), screenwriters (Rosten, 1941), or musicians (Becker, 1951, 1953). Although some of the texts that focus on particular media producers, such as film auteurs (Jacobs, 1969) or “quality” television producers (Newcomb & Alley, 1983), have overemphasized the genius or unique characteristics of particular individuals, the orientation toward producers’ agency foregrounds people’s creative abilities within the constraints imposed by organizations, markets, and regulatory environments.

The study of the people who produce media seems to be rooted in the desire to understand producers’ relationship to ideology, or the commonsensical ways we understand and communicate the world inside our heads. Observers of media production most frequently have expressed these concerns through inquiries into authorship, control, and autonomy. As a result, studies of media production have tended to focus on the people most directly involved in the production of media content, who are often located at the top of production hierarchies. The consolidation of media industries, for example, led many to question the power of corporate media owners to censor media contents (Bagdikian, 1983; Herman, 1981; Thomas & Nain, 2004), particularly news. Studies of gatekeepers – editors, publishers, directors, showrunners, and music and television producers – outpace studies of other kinds of workers, such as the numerous kinds of agents and publicists involved in production. Recently scholars have investigated the activities of those who are involved in other stages and aspects of media production, such as technology creation and production (Mayer, 2009b; McLaughlin, 2007), the manual or technical labor of production (Banks, 2007; Caldwell, 2008), and the marketing of media products (Acosta-Alzuru and Vanstrom in this volume), though more can be done to understand agency in the seemingly invisible processes of media production – such as programming for Amazon’s

mechanical Turk or gold farming for videogame virtual markets (see Striphas, 2009; Nakamura, 2009).

Though there have been many debates as to whether *other* scholars privilege structure or agency in the study of media production, all seem to agree on the need to understand and balance the relationship between the two (Golding & Murdoch, 1991; Grossberg, 2010; Miller, 2006). Each of the authors in the following chapters integrates questions of structure and agency into his or her discussion, though their research questions and thesis statements may be oriented more toward one axis or another. In doing so, they pay a large debt to those who have preceded them, while managing to move the study of media production toward ever more nuanced considerations of geography and temporality, human agency, structural conditions, and their contexts.

The Zeitgeist for Media Production

The chapters collected here reflect various changes in the production of media over the past century, and these changes have entered media production scholarship under a series of hefty, overlapping descriptions, such as “flexible accumulation” (Harvey, 1991); “network society” (Castells, 2000); and “digital capitalism” (Schiller, 2000). Rooted in critical political economy and social theory, these concepts grappled with the transformations in capitalism since the mid-1970s, each one being, in turn, catalyzed and affected by policies broadly construed as neoliberalism. Each of these phrases multiplied as these transformations could be seen in cultural formations. With neologisms such as “convergence culture” (Jenkins, 2006), “network culture” (Terranova, 2004), and the “flexible personality” (Holmes, 2001), scholars observed how structural changes impact media producers and workers, from the blurring of traditional spatial and temporal boundaries for media production to the generation of a new workforce, which gives private information to media industries both freely and without compensation.

The visibility of these issues is of critical importance today, as media production regimes adapt to the changes elicited by crises in the global political economy. Following the downturns precipitated by Fordist modes of production in the 1970s, media production scholars are looking at the recent past of economic bubbles and meltdowns with trepidation for the future. On one hand, the press seems unable to resist the new formation – whether because of its own shifts in priorities for news production or because of its own complicities with what C. Wright Mills (1956) once damned the “power elite.” At the same time, new resistive sites seem evident. Harkening back to the Great Depression instructs that downturns in one media market have led to growth in other industries (McAllister, 2010). New rents and markets accompany new methods of seeking control over the flows of commodities, the valuation of workers, and the commercialization of everything.

It is important to note, however, that these trends become articulated differently across different times and spaces. As Aihwa Ong and Stephen J. Collier (2004, p. 4) have argued through their use of the phrase “global assemblages,” the broad and often abstract transformations associated with globalization need to be located somewhere, among real people in their material, collective, and discursive relations. The case studies offered in this volume present the multiple manifestations of globalization as it affects the structures, technologies, and people involved in media production. Hence the meanings of neoliberalism or citizenship resonate differently across the chapters. For some, the privatization of national media industries and the liberalization of media markets opened the public sphere to democratic communication and to a cosmopolitan consumerism. For others, private media industries have crowded out democratic communication, which would allow public media or alternative forms of media production. These standpoints reflect not only national contexts formed through colonial histories and contemporary imperialisms, but also the disciplinary agendas of studying media production.

The sections that follow in this book highlight a series of concerns that have developed historically in the study of media production. Their interdisciplinary roots reinforce that, despite differences in the authors’ influence and case studies, there have been shared attempts to look at media production regimes and infrastructures; industries and organizations; product flows and counterflows; the nature of production work, workers, and cultures; and the ethical need to consider all of the above. While each chapter presents its own approach to a specific manifestation of the global assemblage, as parts of a section they enter a broader dialogue about the ways to understand media production and to engage in its study.

Production Regimes and Infrastructures

Government, the formal set of institutions for the enactment of laws, establishes the framework for the ways we think about media products, their production, and their producers. In other words, it is the role of governments to determine whether and how media products are resources or commodities, whether and how media production is a public trust or is market-based, and whether and how media producers are laborers or consumers. Infrastructures, according to the anthropologist Brian Larkin (2008, p. 5) are “the institutionalized networks that facilitate the flow of goods in a wider cultural as well as physical sense.” Whereas regimes set the rules and norms for governmental operations, infrastructures connect regimes to people via technical and cultural networks, from fan-based file-sharing groups to underground immigrant economies. Infrastructures thus extend beyond national boundaries, while still reflecting the regional characteristics that give rise to regimes.

The long march toward the transnationalization of media production began in the 1970s, through small steps toward a market-oriented regime that would consider

increasing numbers of goods as commodities and laborers as consumers. Scholars have taken these steps, from international trade policy reforms to national judicial rulings favoring convergence, as a whole in order to mark the path from a liberal regime for media as a public service to a neoliberal regime for media as a commodity.² The chapters presented in Part 1 take this paradigm shift as the starting point for asking questions about how governments structure media production through formal systems of policy and regulation and through informal infrastructures of technical and cultural networks.

To start this part, Katharine Sarikakis and Patrick Burkart and Lucas Logan look at the regime shifts happening on the watches of policymakers in the European Union. Taking bird's-eye views on the international dimensions of these shifts, the authors show how changes in Europe need to be read in light of global convergences in the regulation of media production and information trade. As stated by Sandra Braman (2006, p. 94), economic competition, and not the freedom of speech or the public interest, is the "most important explanatory variable" in justifying this encroaching legal globalization. At the same time, economic competition has been a buzzword to justify the removal of authorship rights, the weakening of labor unions, and the institutionalization of casualized work-for-hire laws (Stahl, 2009). Focusing on how the new regime merges legal definitions around media producers and consumers, Sarikakis reveals that, even if anyone can be a producer in the digital age, not all the producers are equal under the law. Despite the rhetoric that claims to empower media consumers as digital producers, she shows how copyright laws strip these *prosumers* of their rights over the music and videos they download, remix, repost, and exchange. Moving from the national struggles over the legal regime to monetize, own, and control culture to the infrastructure of amateurs who work within these regimes, Sarikakis reveals the ways policy structures affect one's agency over media production. For Burkart and Logan, it will take the mobilization of civil society groups to force the return of media, monopolized as it is by corporations in the "celestial jukebox," back to media producers.

In the struggles over the global governance of media production, communication and media production scholars have not always been aware of the role that governments play in sponsoring media production. Military investment in media technologies has a long record of boosting the competitive advantage of US media companies in broadcast (Meehan, 2005; Smulyan, 1994) and web-based media (Abbate, 1999; Dyer-Witheford & de Peuter, 2009). In his chapter on the most recent articulation of military power, Jonathan Burston looks at "militainment" as key to a government strategy of winning consumers' hearts and minds through popular culture. For example, he argues that the US military's investment in videogame technologies with hawkish war-game themes operates on two levels, as a form of "soft power" (Nye, 2004) in international relations. First, the financing of new technologies assists in the competition for property creation. Second, the contents for these new technologies support the ideological extension of the US empire. The federal investment in the production of media and media technologies – as also discussed by Mari Castañeda

(in this volume) – could be read simultaneously as market domination and as ideological domination.

Despite these mechanisms, in which regimes try to dominate media markets through production, the chapters in Part 1 also present sites of infrastructural opposition. Whether it be through the formation of international movements to press for labor reforms (Mosco & McKercher, 2008) or through the constitution of alternative internet commons to fight digital enclosures (Benkler, 2006), the hegemony of neoliberal reforms across policy spheres has met with networks of resistance. In their chapter, Burkart and Logan point to the rebellious tactics of the “pirate party” – clusters of Internet activists – to subvert European property law. In her chapter, Castañeda refers to the potential power of women of color, who have militated for environmental safety and healthier working conditions in the production of media technologies everywhere. Grounded in social bonds of labor and class and articulated through shared cultural identities of gender and race, these infrastructures present the resources to challenge regimes from margins to core.

The notion of struggle is crucial to the evaluation of governmental regimes and of the infrastructures that cut across them. In the final chapter of Part 1, John McMurria’s comprehensive review of media ownership policy in the United States reminds us that governments are not just in the business of serving citizens; they also set the frameworks through which citizens are defined. Through a comparison of the discursive lenses for arguments about media ownership regulation, McMurria shows how each discourse implicitly undergirds a vision of the citizen in a democratic polity. Superseding the simple binary liberal/conservative, so commonly misused in discussing American politics, McMurria’s analysis encourages us to place policy arguments in the historical contexts of their authorship.

To this end, readers might ask what has caused the problems that plague the current political economy of media production. Are these regulatory problems, for which governments can set a new policy agenda? Conversely, are these systemic problems inherent to capitalism, and thus beyond a fix without a regime change? These questions would likely bring contradictory answers (Fuchs, Schafranek, Hakken, & Breen, 2010, pp. 195–197), but they are of central importance for media studies to understand how we might emerge from the crises that mark the present conjuncture.

The Cultural Industries and the Organization of Production

Following the changes that have pushed production regimes, the chapters in Part 2 implore us to consider the continuities and modifications in the organization of production roles and resources across diverse media industries. From the book publisher to the music distributor to the film exhibitor, the key roles for media production

have shifted, in response to the conglomeration, liberalization, and globalization of media markets as well as to the availability of digital technologies and to the convergence of their contents, delivery, and production. These shifts accompany the perennial struggles in media industries around labor, notably about the discipline of a skilled but cheap workforce, and about the ability to control the production of new commodities, especially data about audiences and consumers. As the chapters in this section demonstrate, the transformations in production regimes have not erased organizational hierarchies and goals so much as spread these hierarchies centrifugally, to encompass ever more people in a web of profit motives.

It was not so long ago that media production scholarship envisioned the organization of media industries as being unique to these industries' specific goods and contents. Sociology and communication scholars took a leading role in distinguishing between various kinds of industrial structures for the effective organization of production. From them, students of media production inherited both the terms to describe production roles and the relations of power that governed their interactions with each other. By the 1980s, these "power roles" (Turow, 1992) seemed fairly stable within national industries. Scholars observed the progressive development of a professionalized workforce in each industry that could balance the tensions between commerce and art within a political framework for managed economic competition. Critical scholars added to this corpus by noting the tendencies toward market monopolization, which were in fact natural to capitalism but also accelerated through the liberalization of media markets. While much maligned for its generalizing assertions, the notion of a "culture industry" (Horkheimer & Adorno, 1972) was in fact a useful tool in mobilizing the humanities to consider the philosophical implications of the organization of production in the study of commercial cultural objects. As increasing numbers of freelance writers and artists, information managers and data miners, amateurs and fans become key players in the organization of plural yet overlapping "cultural industries" (Hesmondhalgh, 2007), the authors of these chapters ask what kind of power different people have in these far-flung production chains.

Ethno-musicologist Timothy D. Taylor begins this inquiry with an introduction to the transformation that took place in music industries under the broad umbrella of the "new capitalism." Pointing to specific landmarks on the path to a global capitalist order, Taylor focuses on "world music" as a genre that captures the impacts on the organization of musical production. The rising centrality of the figure of the music supervisor, national music industries, independent record labels, and the spread of marketing roles throughout production chains have exerted downward pressures on musicians and composers to do more and to serve multiple masters. Meanwhile the imposition of commercial aims over artistic production has surfaced in industry-wide debates over race and authenticity in the construction of a genre that infers, at once, a global everywhere and a "non-Western" space for cool middle-class consumption. This colonial dynamic in search of a consumable "Other" makes the new capitalism not so new after all.

The mantra that the more things change, the more they stay the same seems to resonate in the book industry as well. Laura Miller charts the advent of the electronic book industry as the latest articulation of entrepreneurialism in publishing industries. The ability of authors to circumvent agents, printers, retailers, not to mention out-source editorial functions, has put new pressures on publishers to maintain their professional standing as legitimate gatekeepers of many forms of knowledge production and cultural authority. The result, she argues, is “a two-tiered system in which the truly popular books and the authors committed to traditional standards go with professionals, and large numbers of amateur publishers see their books produced but not widely read” (p. 187). Maintained through an expansive notion of copyright, professional publishers may wield more control in a winnowed market of publishing giants by chasing falling numbers of book buyers and at once by disciplining would-be self-publishers through new technologies, such as ePub and Ipub.

In adopting the perspective of the television producer in the overcrowded attention economy, Shimpach presents his own approach to studying the television industry in the form of four “Ts” (travel, translation, tethering, and tantalization) that describe programmers’ motivations in a multimedia universe. These strategies simultaneously push programs globally while aggregating audiences together for sale to advertisers, media distributors, and ancillary content providers. Shimpach’s organizational model is most germane for explaining the rise of global fan franchises, which tie television to films, illustrated books, music, clothing, and branded places through still other social networking media and games. As Shimpach and others in this volume relate, the global organization of production reflects hegemonic struggles over the creative process and has led to the proliferation across media contents of what Justin Wyatt (1994) called “high concept” in film in the 1990s. Aimed at younger and predominantly male middle-class audiences, these media contents feature more special effects and less dialogue, in worlds filled with other brand products.

Push strategies also have contradictory pulls on workers and consumers. Whereas Miller and Shimpach are more sanguine about industrial transformations that potentially empower labor and consumers as active artists and as collaborative participants, Joseph Turow reminds readers of the political implications of media producers’ commercial imperatives. Focusing on media buying as an intermediary industry between clients looking to target consumers and media industries aiming to sell advertising space, Turow notes a disturbing trend and an offense to citizens’ privacy rights in a democratic society. Behind the promise of individual freedoms and personal choices offered in cyberspace lurks an economic infrastructure dedicated to tracking, marketing, and predicting individuals’ consumer behaviors. Through an eerie echo of a Fordist economy in which industries saw employees as their own consumer base and as part of the profit cycle, many of those same companies now trade their employees’ personal consumer data to tailor better websites selling to them. As this marks the dissolution of boundaries between workers and consumers, it perhaps needs little imagination to understand how the Italian theorist Maurizio Lazzarato implicates media industries in making a “social factory” (cited in Wright, 2002).

Product and Content Flows

Whereas studies of the organization of media industries have centered, typically, on corporate operations in a few select metropolises worldwide, studies of media flows have focused, historically, on the distribution and exhibition of these industries' products. The concern over media flows has a geopolitics that coincides with widespread discussions of decolonization in the twentieth century. In those discussions, critics claimed that the distribution, if not the wholesale dumping, of media products from the Northern hemisphere to the Southern hemisphere and from Western countries to those in the East echoed imperialistic and militaristic tendencies of the industries' base countries. They further drew parallels between the imposition of foreign goods, together with their production infrastructures, and the recolonization of peoples in countries that are developing their own national identities and cultural industries. In a series of international forums organized through the United Nations Economic, Social and Cultural Organization (UNESCO), officials in developing countries throughout Latin America, Africa, and Asia asserted the need for a New World Information and Communication Order (NWICO) that would be supported through national media industries and regional alliances, particularly for news distribution. Although the global political discourse around imperialistic media flows has declined since the early 1980s – no doubt with the assistance of US and UK budget cuts to UNESCO (McPhail, 2009) – the debate over the need for a NWICO continues to frame international media production scholarship (Chakravartty & Sarikakis, 2006) and to animate international political movements such as the World Summit on the Information Society (WSIS) and the non-governmental organization (NGO)-sponsored Communication Rights in the Information Society (CRIS) Campaign.

The first two chapters of Part 3 continue these discussions of media flows, starting in many respects from their historical precedents. Dal Yong Jin presents both those who have articulated a thesis of cultural imperialism in communication research and those who have subsequently called for its abandonment. In evaluating these positions, Jin brings together a wide range of empirical data on Asian media industries to demonstrate that, while Japan, Korea, and China develop their own film industries and media exports, the balance sheet for cultural imports is still tipped in favor of transnational media industries based in the US and, in the case of Sky-TV, in Australia. The development of national music television (MTV) networks across Asian countries emphasizes the ways in which foreign multinationals extend their reach through global economies of scale. In the following chapter, Tamara Falicov illuminates possible reasons for the continuities of such foreign interdependencies. Focusing exclusively on national film industries in Latin America, Falicov delves into recent trends in cinematic co-production and co-distribution, which complicate national legislative initiatives to fund indigenous film production or to establish exhibition quotas. Her exposition asks the million-dollar question (p. 265) that pervades debates about media flow inequalities and imperialisms: "Do countries such as Mexico and Argentina

thrive, or do they get exploited under these conditions?" The emergence of Mexican and Argentinian film auteurs at the expense of cheaper production labor in those countries suggests that some people thrive through the global media economy at the peril of others (as illustrated in Castañeda's chapter in this volume).

It should be remembered in studies of media production that the keyword *glocalization* derived from Japanese marketing strategies in the 1980s (Robertson, 1994). These strategies stress the ability of producers to adjust media products so as to import and export locations as both an economic and a cultural imperative. To wit, Lothar Mikos and Marta Perrota, in their chapter, address the television format trade as a study of "glocal" media production. The international licensing of formats requires that producers adapt the concept and premises for television contents to the local sites of reception. While this process seems relatively simple in the reproduction of licensed game shows and reality programs, the global transport of narrative-based television programs has been less common historically, which became one of the primary grounds in the refutation of cultural imperialism claims (Straubhaar, 1991). The transnational market for the telenovela (soap opera) has, however, introduced the possibility of glocal media flows, which are based around universal melodramatic themes and adaptable narratives. In their comparative study of several national productions of *Yo soy Betty, la fea* (*Ugly Betty*), Mikos and Perrota illustrate the strategies that television producers use in order to adapt the story paying heed to consumers' cultural differences. Their research conceives of media flows in terms of the cultural interconnections between producers and audiences across national boundaries.

Perhaps these disparate interconnections demand new approaches to media flows. Grounded in an anthropological approach, Katrien Pype urges scholars to frame the local and the global flows of media in terms of key scenarios – that is, the ways in which texts employ symbolic meanings toward a shared narrative of culture. Drawing on her fieldwork in the city of Kinshasa, Congo, Pype traces the common religious and political meanings that circulate through popular film and television programs in spite of their differences in origin, creation, distribution, and reception. Whereas Mikos and Perrota's work reflects how we might understand cultural differences through the production of a shared narrative, Pype's work urges scholars to understand the ways shared key scenarios follow the migratory flows of various media, their producers, and their audiences.

This section also illustrates the degree to which entertainment and audiovisual industries have displaced news and print industries in academic research on media flows and cultural trade. Beyond questions of technology and form, there are many possible reasons for the shift in attention related to news production: the overall economic decline of print and newspaper industries, together with the expansion and conglomeration of television and film industries; the expansion of viral citizen journalism outlets – and so on (Shirky, 2008; Zelizer, 2009). While these trends suggest that traditional news flows have perhaps been diverted to other media, it remains important that scholars understand how production and distribution trends impact the flows of cultural meanings and information that citizens need for demo-

cratic deliberation and participation. In the post-news era, what are the media industries responsible for creating a global class of “cultural citizens” who, aside from consuming media, also use media toward political ends?³ Who are their producers? Where are the centers and peripheries for their production practices, goods, and audiences? These questions are of vital importance for interpreting not only the formation of collective memories across borders but also the instigation of global social movements in the future.

Production Work and Practices

Scholarship on the routine work of producing media sets itself apart from the numerous quasi-journalistic accounts of particularly successful workers whose names have emerged from media industries into the public sphere. Whereas popular accounts have portrayed the creative process through celebrity biography, sociological, economic, and communication researchers in the mid-twentieth century undertook the tasks of understanding the organization of media production, the roles of media workers in the organization, and the routines of the creative process that led to familiar genres and largely predictable outcomes in market terms. It’s no small coincidence that the growth of interest in production work after World War II accompanies the standardization of media production within industrial modes, as well as to the growth of schools for the professionalization of media production.

Today the integration of ordinary people into media industries is what Graeme Turner (2010) calls the “demotic turn,” and it has widespread implications across media types and labor markets. From the news blogosphere and its attendant citizen journalists to YouTube and its home-taught video producers, digital media and an army of “do-it-yourselfers” (DIY) have transformed media production work. On one hand, they seem to dispel the notion of the media professional as constituting an elite faction with a monopoly on creative skills, resources, and talent. On the other hand, they raise questions about the credibility and legitimacy of all media production work. The political, economic, and organizational changes discussed in the previous sections have caused crises not only among government policymakers, business industrialists, and media executives, but also among media workers themselves. The chapters in Part 4 put changes in media workplaces into context, both for the workers in those sites and for media researchers concerned with long-standing issues about authority and control in media production.

David Ryfe provokes us to look at continuities in the production of news, despite the challenges of digital DIY news. Ryfe recalls classic studies of news sociologists in the 1970s, who found that professional journalism relied on the successful internalization of production routines that helped workers negotiate the complexities of their workaday worlds. At the same time he builds a definition of routine that emphasizes both its commonsense appearance and its flexibility. This definition builds on

the relationship between the routine and the normative, showing that socialization, far from being just a process of rote learning, involves an intersubjective sharing of ideals about what journalism is. As Espen Ytreberg shows (also in this volume), media professionals train to embody this social knowledge through performances, so that even the most seemingly spontaneous chatting between news anchors follows highly managed schemata.

Ytreberg's work on the production of realism across a wide variety of media genres – including talk radio, broadcast news, sporting events, and reality programs – shows how linguistic, temporal, and spatial conventions function as ways of providing order and control over media performers. Drawing on a body of literature often associated with the presentation of the self in everyday life *à la* Erving Goffman (1959), Ytreberg adds Michel Foucault's (1977) insight that self-regulation serves a disciplinary function in society. From this readers may ask to what extent production work lives up to its promises of creativity, autonomy, or self-realization.

In an attempt to operationalize the ways production workers experience the creative process and its workplace constraints, Carolina Acosta-Alzuru offers a longitudinal study of the making of a telenovela in Venezuela during – and despite – national political unrest and economic turmoil. On the basis of Richard Johnson's (1986/7) model for a "circuit of cultural production," Acosta-Alzuru demonstrates the multiple pressures that production staffers faced every day – from network ratings wars to tabloid columnists – in addition to the threat of military invasion and censorship. Her account avoids reducing the production process to a mimetic reflection of the political scenario, while showing how the political polarization of Venezuela could be represented through popular entertainment. At the heart of her study, Leonardo Padrón remains the program's author and creator. Reminiscent of the auteurist tradition in literary and film studies, Acosta-Alzuru is mindful of Horace Newcomb's (1974) definition of television as a popular art, and thus as a legitimate site for evaluating the producer both as an artist and as a production manager.

If Acosta-Alzuru's case study stresses the creativity of the auteur in media production, the research conducted by John Caldwell and his co-authors shows the ways creativity is distributed throughout production chains in film and television. Focusing on a bevy of workers who are invisible to most consumers but essential to the production of entertainment media, this group of researchers demonstrates the unequal burdens carried by workers who earn less, work under shorter and more time-intensive contracts, and receive virtually no credit for their inputs. These invisible laborers and their assembly line-like tasks emulate the "degradation of work" (Braverman, 1975) in what researchers have called the "creative economy" (Hartley, 2005) or the "new television economy" (Mayer, 2011) in the twenty-first century.

Adding to the host of constraints on media producers, Alexandra Juhasz closes Part 4 by examining the production medium itself. Juhasz's brilliant experiment in teaching media production via YouTube not only counters popular notions of artistic freedom and self-expression in the digital age; it also demonstrates the inbuilt limits

of the technologies for work and play (Wajcman, 2004). Her method of study, which follows in the footsteps of a liberatory praxis (Freire, 1970), demonstrates how her students – and, by extension, her readers – may gain critical consciousness by testing the limits of a supposedly democratic web-authoring site. Her rules for how to produce on YouTube and for its impositions on producers may well be read as the rules of engagement for the web 2.0 generation.

Participant observation as a method has been central to the constitution of scholarly knowledge about production work (Alvarado & Buscombe, 1978; Cantor, 1980; Dornfeld, 1998; Grindstaff, 2002; Johnston, 1982). Whether joining the newsroom for a time, like a beat reporter such as Ryfe, or drawing on years of experience, like a Hollywood assistant such as Hill, the authors in this section recognize the importance of practice to the formulation of theory. Acosta-Alzuru and Ytreberg get unprecedented access to production practices and texts generally kept confidential – namely the making of a politically charged telenovela in authoritarian Venezuela and the production “bible” for the wildly popular reality television program *Big Brother* in Norway. From their vantage points, participant observers not only gain access to people and places but also can empathize with the time-crunch principles and resource roadblocks that drive media production and creative decisions. Their looks behind the scenes into trade practices usually kept from public view, whether to avoid competition or censorship, militate against the industry’s adage that in television “nobody knows.”⁴ At the same time the focus on workers as laborers, performers, and creative artists frequently implicates the authors themselves in these roles, raising questions not just about the complicated nature of research on human subjects, but also about the boundaries of media production work itself. In what ways are academic work and media production work similar? How do their routines inspire or constrict knowledge creation and creative action? Might these similarities lead to solidarity or dissent in the future politics of labor?

Production Cultures

Delving deeper into the politics of production work, Part 5 is dedicated to the cultural construction of media producers. If studies of media production have diligently documented the political and economic structures that frame the organization, flows, and practices of production work, it is not always apparent how media production intersects and reflects the structures of feeling that the social theorist Raymond Williams (1977) located in ordinary everyday life. For, at the same time as they produce cultural objects and texts, media industries also produce the communities of people known as “producers.” Each with its own rituals, traditions, and ways of seeing, these communities generate “production cultures.” Part 5 offers various modes for understanding structures of feeling within work-specific production cultures, from the ways in which group members form their work identities and locate

themselves within intercultural hierarchies of gender, race, and nation to the affective politics of production work.

Hortense Powdermaker's (1950) decision to observe Hollywood and its denizens in the same ways she approached her subjects in Papua New Guinea (1933) marked a disciplinary turn for anthropologists – a turn to examining cultural “islands” in their own society. Looking at the personal networks of people living and working on this “island,” which is defined by big capital and by egos larger than life, researchers (Caldwell, 2008; Gitlin, 1983) have understood the creative process as essentially conservative and as based on the preservation of social hierarchies and individual reputations more than on the exaltation of revolutionary change or singular genius. “It’s not what you know but who you know,” the cliché resounds throughout production cultures – though in Hollywood the opaque functioning of a success also gives rise to the adage that “nobody knows,” as discussed earlier. Even as Hollywood has become the location of global investment, labor, and capital, its culture has worked historically to promote select cadres of individuals – individuals who tend to be white, male, and educated in a select grouping of schools – for employment positions associated with the creative direction of US film and television production. While these cultural dynamics are by no means universal across media industries and media capitals (Ganti, 2012; Streeter, 2010), the study of the politics of inclusion and visibility within the work settings for making media reveals in this section how media makers preserve an identity amidst the global media flows that threaten fragmentation.

Beginning with the question of queer invisibility, television historian Quinn Miller asks us to understand how Hollywood’s production culture operated and what its limits were in terms of labor and representational politics. Although it has been long understood that Hollywood attracted large numbers of Jewish, gay, and lesbian workers who saw this enclave as a safe space for employment (Gabler, 1988; Gross, 2001; Hoberman & Shandler, 2003), scholars have interpreted the lack of the representation of these identities in media contents as evidence of the culture’s homogenizing effects. In other words, the labor market and its outputs seemed to operate according to different logics of identity; whereas Jews and gays socialized openly in the studios, their identities never appeared on screens, except in the most stereotypical ways. Historians of media production and reception have altered this perception, pointing out the subtle and yet persistent ways in which ethnic and sexual identities can be read into media contents aimed at mass audiences (Bial, 2005; Hansen, 1991; May, 1980). Arguing that producers relied on the knowledge of insider communities to identify the queer performance, Miller aggregates a wealth of early US television performances that could be interpreted through dual lenses. Using a combination of trade materials and biographical accounts, Miller alters our perception of a production culture that excluded others, making us see instead one that allowed for a range of playful tactics within the still amorphous boundaries of the early medium. This account shows that, even as Hollywood could consolidate disciplinary control over its workforce through unfair contracts, intellectual property regimes, and blacklists,

it could also allow a flexible range of creative activities that would be impossible in other spheres and industries.

The word “flexibility” resonates differently for those who study media production regimes and for those who study the producers within their cultures. For the former group of scholars, flexible production points to the changing means through which managers control their workforce, offering shorter contracts, fewer benefits, and less stable employment to satisfy the just-in-time nature of manufacturing for global markets. For the latter group of scholars, however, flexibility can be simply a way of life. Working in the post-Fordist fishbowl, media workers today hardly know the ways media executives co-opted the ideologies of freedom and authenticity from revolutionary social movements into their own precarious workplaces (Boltanski & Chiapello, 2007). These contradictions are central to production cultures globally, as Serra Tinic and Sylvia Martin demonstrate in their respective investigations of Canadian and Hong Kong film and television workforces. Further illustrating the need to see the local dimensions of global assemblages, Martin and Tinic excavate very different subjective responses to the transformations evoked by flexible production regimes.

For Tinic, the ebbs and flows involved in the runaway film production economy in Vancouver, British Columbia, have re-emphasized producers’ feelings toward their identities as Canadians. Reflecting a physical geography that pretends to stand in for anywhere in the world, the cultural geography of film production is one in which producers connect and identify with local, national, and international production cultures. While some might suppose that these connections alienate producers, who become handmaidens to stories located elsewhere, Tinic reveals that they can also be used as a cultural strategy, to straddle both sides of the border. Highlighting the oeuvre of a successful showrunner, Tinic demonstrates how Canadian producers may wager their success in “Hollywood North” to launch innovative projects in the US. Understanding these production ecologies, Tinic argues, may be important for building a Canadian creative labor force, though the ecologies would inevitably focus our attention on a few exceptional workers at the top of labor hierarchies.

Through a thick description of people located in the Hong Kong film industry and of its diasporic workforce, Martin sheds light on the anxieties threaded through production cultures. As she shows, making a living has not been easy within an industry suffering a series of economic and political crises. In response, workers have developed their own cultural narratives in order to explain and defend the unique value of their industry and their contributions to it. In this precarious environment workers are quick to promote their adaptability, their hard work ethics, and their ability to do more for less as values organic to the cultural community, even if this means self-exploitation or it replicates colonial associations with the pliant Asian laborer. Caught between traditional cultural norms and international market pressures, Martin’s layered account of Hong Kong’s production culture reveals how workers’ gender and class identities are shaped in relation to national and foreign discourses about the industry and the respectability of its laborers. These kinds of

ethnographic insights are important for understanding the ways production cultures reproduce social hierarchies even as they respond to a shifting political economy (Gill, 2007a; Mayer, 2011).

These social hierarchies are also at stake in production cultures that form themselves in resistance to mainstream media production spheres. Situated in the educational spheres of media literacy, youth media production, and a praxis-based pedagogy, Lora Taub-Pervizpour reflects on the challenges involved in creating a production culture that foregrounds the creative impulses of low-income young people of color. Raised within a scholastic environment that demanded complicity, the young producers who participated in a community video project began to question authority through the production process. At the same time, Taub-Pervizpour recognizes that, in the process of giving young people a public voice through media production skills, adults must also take responsibility to assist, protect, and even defend this vulnerable voice, for the “processes that attempt to value the voice of the youth will be threatening to those who hold traditional forms of power over them – the very power that functions by denying them an effective voice in their community” (p. 522). Ultimately she contends that, in order to sustain an egalitarian production culture, adult and youth participants alike must critically reflect on the means of inclusion and exclusion in the processes that surround not only the production, but also the distribution and exhibition of their resulting projects. Taub-Pervizpour’s concerns with the diversity of voices in production cultures could easily extend to all production cultures that continue to be unequally accessible to their potential members.

The Ethics of Production

The final set of chapters in this collection concern the moral dilemmas that surround media production, from the orientation of policy regimes to production work and to the study of media production itself. Whereas in much of the world governments have enforced media production rules, codes, and standards through formal public service obligations, professional credentialing, and censorship regulations, at least two global changes have impacted the implementation of media production ethics. First, the privatization of national media industries and the liberalization of national media markets have weakened industrial codes of conduct in the face of market competition. Second, the explosion in distribution venues for amateur-produced or user-generated media has hindered governmental efforts to establish or enforce ethical guidelines, especially across national boundaries. Nevertheless, public pressures for media production ethics have hardly dissipated, as is evidenced by outcries over the public dissemination of government documents related to war and diplomacy via the website WikiLeaks. Whereas the public call for media production ethics has been largely motivated by moral panics and cynicism (see Balio, 1985; Bracci,

2003; Murray, 2007), the authors in this final Part 6 maintain a sense of optimism in foregrounding the ethical considerations that need to be considered in media production scholarship.

Dafna Lemish, to begin, investigates definitions of quality among children's television producers in order to improve the genre, not to eliminate it. Her interviews with producers show their attempts to negotiate cultural distances between globally circulating television representations and locally situated young audiences. These negotiations involve ethical concerns in establishing the distance between the self and the other, or the familiar and the foreign, which forms the basis for tolerant understandings of humanity (Silverstone, 2007). In the process, her cross-cultural and transnational study interrogates normative definitions of childhood and vulnerability, as well as perceptions of gender differences and cultural imperialism in production values and programming practices. Overall, the concurrence among producers that children's television should feature strong, complex, and diverse characters in ways that support local cultures and tolerance speaks well of television professionals, who are frequently maligned as aiming for the lowest common denominator in society (Berger, 2003, pp. 89–100).

By the same token, Ellie Rennie implores us to question the need to celebrate community media production as inherently more progressive, participatory, or meaningful to its local producers or audiences. Taking a variety of case studies of youth-oriented media production as examples, Rennie illustrates that the “community” of community media can be just as exclusionary as mainstream media, and that neither of these media sectors is free of the political limits of the nation-state or of the economic constraints of global capitalism. In advocating a more practical approach to community media, Rennie looks to policy options for stabilizing non-profit and non-governmental media production as a third sector of the communications landscape. In doing so, she follows in the footsteps of a long tradition of media scholars who have acted as either policy advocates or policymakers (Bennett, 2006; Braman, 2003; Cunningham, 2009). Her suggestion of an independent labeling system for community media, akin to fair trade labels, not only shifts ethical questions from media production to media consumption, but also echoes those in community media who see media literacy and consumer education as vital to creating alternatives to purely profit-driven media systems (see Goodman, 2003; Howley, 2010).

The commodification of the self, the erasure of limits between work and leisure, and the endless anxiety discussed by so many of the authors in this volume as characteristics of commercial media systems and of creative industry work raise ethical questions for David Hesmondalgh and Anna Zoellner. After all, if work is exploitative, jobs unstable, futures uncertain, what is good work any more? This question looms for critical media scholars to explain why so many aspirants line up, indeed compete, to become media producers. In evaluating the ethical issues inherent to judging good work, the authors make the case for recognizing the elements of “autonomy, interest and involvement, sociality, self-esteem, self-realization, work–life

balance, and security” that comprise good work as philosophically un-alienated labor (p. 570). These elements were prominent in the authors’ interviews with practitioners in British and German television documentary projects, and they form the basis of a grounded politics of media labor that would account both for the pains and for the pleasures involved in media production. These dualities of experience thus overcome the polarities of techno-utopianism and the precariat’s pessimism in thinking about media work ethics (Gill, 2007b); they also demonstrate the need to continually re-theorize social theories of alienation in the context of contemporary media work realities (Mayer, 2009a).

The need to revisit social theories of production is also explicit in Rick Maxwell and Toby Miller’s project of bringing in the environment as a central theme in media production research. Warning against the implicit celebratory tone that frequently accompanies discussions of media users’ mobilities and flexibilities, the authors remind readers that every technology is the product of a Faustian bargain with the environment that must be labored, mutated, and spoiled for modern conveniences. In doing so, they underscore Nick Couldry’s (2006) call to “decentralize” representation as a primary focus in media ethics in order to look more closely at the differences that the media make in the material conditions of everyday life. These differences, they argue, affect most dramatically and unethically those media producers and receivers who lack the political voices through which they could defend themselves – namely the millions of workers who serve multinational information and communications technology (ICT) corporations through mining, factory assembly, and salvage recycling. Maxwell and Miller’s urging to consider the environmental impact of these activities is part and parcel of an emerging field of communication ethics that recognizes “the principle of ecological reciprocity, our obligation to support the ecosystem that supports us” (Mackin, 1997, p. 2).

Each of the chapters in this section perceives the social impacts of media production research – although, taken as a whole, the contributors in this section present an interesting dilemma on the subject of how to conduct that research. On the one hand, they stress the importance of listening to media practitioners in order to understand media harm or exploitation – whether to young audiences for children’s television in Lemish’s study or to the contracted employees of independent documentary productions in Hesmondalgh and Zoellner’s research. On the other hand, they promote a critical understanding of media production that stresses the ethical need to question received assumptions, for example about definitions of community, participation, and progressive politics (in the case of Rennie), or even about the primacy of texts and contents in media studies (in the case of Maxwell and Miller). The balance between ethical listening and ethical critique is a challenge for all the students of media production, and indeed for all responsible citizens. They further illustrate that, beyond media industries and their practitioners, ethical considerations of media production implicate all of us – producers, consumers, workers, and researchers.

Producing the Field

The chapters that follow here share the conviction that researching production is an essential element in media studies. As such, they illuminate the people, processes, and institutional structures that have tended to be invisible to media users and consumers. As the political economic forces and cultural articulations of the digital age construct these users and consumers as producers and prosumers, it is vitally important that media studies continue to explore production through the trajectories offered in this book. For, while there will always be newer technologies and corporate entities, realignments in the geopolitics of regulation, and shifts in the organization of work and in the definitions of media workers, the categories for the analysis of these developments and of their historical concerns remain. If anything, this volume shows that the concerns over commodification and authenticity, control and autonomy, capitalism and its alternatives have become more pressing.⁵ Knowing the diverse approaches to studying media production will hopefully help generations of researchers and students, producers, and activists not only to understand the changes in light of these concerns, but also to formulate strategies for action.

NOTES

- 1 This definition of media studies runs throughout the 2009 special issue of *Television and New Media* entitled *My Media Studies*.
- 2 Even in the United States, where corporate forms of capitalism first took hold over media production, the commonsense point of departure for production was grounded in the notion that government worked on behalf of the public good to manage markets. Discussions of the liberal state's role in US media production abound; they include McChesney (2008), Braman (2006), and Grossberg (2005).
- 3 I recognize the ambiguity both of the phrase "cultural citizen" and of the kinds of politics that may be attributed to citizens' activities in the sphere of media consumption (Hartley, 1999; Hermes, 2005; Miller, 2006).
- 4 The phrase "nobody knows" has typically been used to express the uncontrollability of television markets due to the high level of uncertainty over the success of the economic product – that is, uncertainty as to whether a program will recover its sunk costs (see Caves, 2000 for a discussion of this economic logic). Participant observation of media production shows, on the contrary, how much media practitioners *do* know and can ensure the economic viability of a program.
- 5 Returning to the seemingly invisible process of creating this text, one of the very concerns over media commodification and control is embedded in the text via an editorial decision to use the uppercase "I" in the term "Internet," a spelling that media scholars increasingly see as connoting branding and ownership of a public good (Schwartz, 2002).

Media Studies

The Interdiscipline of the Present and the Future

Angharad N. Valdivia

Media studies is a rapidly growing, widely relevant, and evolving field – an interdiscipline (Valdivia, 2003). While some scholars have bemoaned the loss of focus on process and effects, especially on milestone studies (DeFleur, 1998), others find the breadth and porous contours to be conducive to a worthwhile intellectual pursuit (Sterne, 2005). To be sure, between 1998 and the present, there has been a huge growth in interpretive and critical approaches, which have nonetheless flourished in the margins as the effects paradigm – the stuff of milestones – has firmly retained its central place in the field, at least in the United States and the Netherlands. Indeed, efforts to map out the diversity of the field of communication (Craig, 1999, 2001), which we might call the broader umbrella for media studies, yield a multiplicity of sometimes overlapping and other times mutually exclusive approaches. The terrain of contemporary media studies acknowledges that most of us live in intensely mediated environments, so that Livingstone (2009) writes on the mediation of everything, and Hay (2000) writes of refrigerator studies. The former expands on how media and communication are “ever more crucial in today’s world” (Livingstone, 2009, p. 13), and the latter asks us – as a field over a decade ago, while continuing to encourage us (Hay, 2010, 2011) – to consider the broader web of networks to which other technologies, such as refrigerators and toasters, contribute in terms of routines and practices that serve to mediate the world for us. The latter line of questioning has proven immensely prescient as many of us live in highly networked webs of media and communication, where not only can our location be pinpointed at any given moment thanks to elements in our mobile technology, but also, if we chose to, we can broadcast a narrative of our location and other audiovisual bits of information constantly to many – such as our hundreds of Facebook friends and Twitter or Tumblr followers.

The International Encyclopedia of Media Studies, First Edition.

Nonetheless, whether we are talking of old media technologies or institutions (see Nerone, Volume 1, *Media History and the Foundations of Media Studies*), we are witnessing the constitution of new audiences and a shift in traditional audiences (see Parameswaran, Volume 4, *Audience and Interpretation*) through the invitation offered by seductive content in a dynamically converging and synergized media environment (see Mazzarella, Volume 3, *Content and Representation*). The effects of these technologies and content continue to be measured and studied (see Scharrer, Volume 5, *Media Effects/Media Psychology*). While media platforms and patterns of production are converging, enduring tendencies toward concentration of ownership and control of media industries coexist with the emergence of new patterns of labor, practices, and updated forms of exploitation (see Mayer, Volume 2, *Media Production*, as well as some chapters in Gates, Volume 6, *Media Studies Futures*). This is not surprising given the rapidly expanding new media and communications technologies, many of whose functions replicate previous technologies while other uses (and abuses) bring new possibilities, utopian and dystopian, to the fore (see Gates, Volume 6). Unexpected global locations of nodes of influences result in previously unsuspected transnational alliances and networks (Castells, 2009).

As an early caveat to this triumphal celebration of media, I must remind readers that most of the above sentiment refers to a media-rich group that luxuriates in a wealth of networks and technologies. Yet we must not forget that even as I write this introduction at the very end of 2011, fully 50% of the global population have intermittent access to electricity. Mobile telephony may be widely spread, but the radio remains the most reliable global medium (see the *Journal of Radio Studies*). Beyond the fact that it is cheap, it neither relies on nor requires electricity or literacy, in English or any language. Furthermore, despite our current fixation with digital, wireless, and mobile media technologies, in times of crisis – whether natural such as a huge earthquake or in wartime – when the electric networks are down and we are thrown back into old school forms of media and communication, radio returns to its central location as a reliable and essential medium. So before you continue reading this introduction, or continue to read any of the absolutely outstanding volumes of this encyclopedia project, go out and buy yourself a radio – one that is both electric and battery powered. You might never need it, but if you do, you will be very relieved to have it.

The fact is that media are everywhere, and nearly everyone shares lifelong experience with and expertise on particular forms of media. Dating back to the 1920s – as identified both in Nerone, Volume 1 and Mazzarella, Volume 3, the study of media has been multi-modal and heterogeneous. Theoretical and methodological complexity has grown since the Payne Fund Studies. International, transnational, and global perspectives have become absolutely essential. Not that they ever were not, but now that media are produced, consumed, and circulated transnationally, media studies has to take this into account. Inclusivity of the heterogeneous components of the population in regard to the media has also grown. Scholarship that was once nationally bound and focused on White middle-class males has expanded to take into consideration gender, nation, region, age, ethnicity, sexuality, ability, and class.

Furthermore, as both Downing (2003) and Castells (2010) remind us, we must not forget the importance of religion in the contemporary world, as many armed conflicts revolve around religion, and media content, production, audiences, and effects are interlaced with religious impulses.

Media studies is an interdiscipline. As such it draws on and benefits from a number of contributing fields such as history, philosophy, psychology, political science, education, literature, and sociology. Yet even as it draws on those many fields, it is its own area of studies. Too often other fields, whose interdisciplinarity takes them into media studies, see this interdiscipline as new – as in, “oh look, we just discovered that we ought to look at media.” Our field becomes the direct object of other scholars’ deployment of the myth of discovery. Just like Columbus discovered “America,”¹ scholars from other fields continue to “discover” media and media studies. A century’s worth of theories and research disappears in the process, and many of us often find ourselves in other disciplines’ conferences listening to presentations that implicitly suggest direct effects, transparency, mimetic images, and so on. Transparency, when media content, industries, audiences, and practices are treated as if they spoke for themselves, as if there were no mediation, is often the tactic taken by scholars outside our discipline. What we as a field contribute to the understanding of culture and society is, at the very least, that mediation is complex and that understanding mediation helps us to uncover patterns of power, distribution, and potential justice. Media studies is about unearthing and maximizing the democratic potential of practices, institutions, technologies, and audiences that pervade our contemporary life.

Nonetheless, as Gates reminds us in her introduction to Volume 6, one central question for both the present and future of media studies concerns the very definition of media: What counts as media now that it no longer makes sense to limit the term to film, television, audio, and print? Does it still make sense to refer to a broad concept or category of “media”? If the more appropriate terms are “digital media” or “new media,” then what do *these* terms encompass? Terms like “convergence,” “remediation,” “interactivity,” and “user-generated media” capture a general sense of current transformations, but what are some productive ways of parsing out the complex dimensions and issues that these terms encompass? By paying careful attention to issues of history and context, this encyclopedia seeks to trouble the usage of these terms even as they are used rather carelessly in popular culture and public policy.

The six separate volumes of this encyclopedia were present as six separate sections in *A Companion to Media Studies* (Blackwell, 2003), the volume that provides the model for this encyclopedia and that was, in turn, modeled after McQuail’s *Mass Communication Theory*. The editors of the individual volumes put together a stellar cast of authors who in turn produced original chapters. All volume editors were asked, indeed implored, to compose a table of contents that was inclusive in many ways. First, inclusivity in terms of global topics was paramount, and we strived for inclusivity in terms of authors and global regions as well. This, as I have discussed elsewhere (Valdivia, 2011b), is not as easy as it sounds. Differential access to the latest

research, culturally different approaches to writing and developing an argument, resources that might enable a given scholar or team to develop a project and get it ready for publication, and so on, are all variables that effectively discriminate in favor of those of us in well-funded research universities in wealthy countries. We recruited some scholars whose work we translated into English, and all editors worked assiduously to cast as global a network as possible.

Another element of inclusivity was paradigm diversity. Schooled at the Institute of Communications Research (ICR) at the University of Illinois, I am the recipient of an educational tradition that highly values paradigm inclusivity. Insofar as it was possible, we included scholars using quantitative and qualitative approaches, sometimes both of them at the same time. Obviously the *Media Effects/Media Psychology* volume focused solely on the social scientific tradition, while both the *Content and Representation* and *Audience and Interpretation* volumes included scholarship using both approaches. A third element of inclusivity was gender, race, and sexuality diversity. Cutting across as a focus that can be conducted in the research included in any of the six volumes of this project is the work of transnational feminism and globalizing gender studies (Hegde, 2006). Editors sought scholarship that would include these vectors of difference, as media studies really makes no sense without their consideration. Yet even within each of these categories we encounter new gaps that merit more research. For example, as Mazzarella mentions in the introduction to Volume 3: “the reader might notice that the volume is heavy with studies of cultural representations of females. Indeed, seven chapters deal with some aspect of this topic, while only one deals with masculinity. Yet this is representative of the field, as studies of media portrayals of women and girls have been very prolific, and media studies scholars have only recently begun to seriously study mediated portrayals of masculinity(ies) (Mazzarella, 2008).” The rise of masculinity studies follows feminist studies as a logical move once we realize that femininity is socially constructed. Indeed, this is a process that this collection of volumes entices us to accomplish: a greater degree of preciseness to this complex concept of media studies, which all of us who work within the interdiscipline intellectually seek to explicate.

As a final note about process, these volumes have been peer reviewed in an innovative manner for an edited collection. First, each table of contents was submitted to the peer review of a senior scholar within that area of the field and edited accordingly. Then, as the chapters came in, within each volume authors reviewed other chapters. Ideally, each chapter was reviewed by two other authors as well as by its editors. As the overall editor of the project, I carefully reviewed all volume editor introductory chapters. Now the review process is turned over to you, the reader.

Media Studies Today

As an organizing principle for this book, I have followed since 2003 the structure provided by many different editions of Denis McQuail’s *Mass Communication Theory*:

An Introduction. Dating back to the first edition in 1983 and up to the sixth edition in 2010, whose name has changed, appropriately enough, to *McQuail's Mass Communication Theory*, Denis McQuail provided a manageable way of dividing up the field into components that, while overlapping – as they had to be since these components were teased out more for scholarly inquiry than because they are discrete and differentiated – provided a useful way to look at the breadth of study of the media. We all experience media as an integrated experience. Media inherit values and histories that are in turn explicitly or implicitly incorporated into their production; then we either consume and/or interpret media in relation to regimes of representation, with particular audiences and interpretive tactics in mind, with some desired effects over which we have little control, and contributing to a future that – like effects – we wish we could influence but really cannot. Still for the purposes of research, we tease out the media experience into a number of areas.

The volumes of this encyclopedia match the sections of the *Companion*, which used McQuail's schema and added the “futures” section. Thus we have history, production, content and representation, audience and interpretation, media effects/media psychology, and futures. We will later add a “methods” volume to complete the encyclopedia. While these areas are teased out for the purposes of research, there is great cross-pollination by scholars in media studies. We find that some scholars use both qualitative and quantitative methodologies, or at least rely on both. We also find that many scholars write about two or more of the six areas mentioned above. In fact, many of the major trends in current research encompass holistic media studies approaches. Among these contemporarily salient research projects are network analysis (e.g., Castells, 2009, 2010; Chan, 2007, 2011, forthcoming; Gilbert, Karahalios, & Sandvig, 2010); girl studies (Banet-Weiser, 2011; Durham, 2004; Projansky, 2007a, 2007b, 2010; Valdivia, 2008, 2009, 2011a); transnational feminism (Hegde, 2006; Molina Guzmán, 2010; Valdivia, 2011b); and neoliberalism as an undergirding framework of analysis (Banet-Weiser, 2011; Hay, 2000, 2010, 2011; Hoerl & Kelly, 2010; McCarthy, Pitton, Kim, & Monge, 2009). McCarthy (2011) expands the focus of neoliberalism in media to the educational system and the efforts of many cities, such as Chicago, to become a cosmopolitan, globally vibrant center of economic activity, thus linking media studies to educational policy studies.

Many of these recent research tendencies converge in the critical examination of the “posts.” Scholars develop amazing analyses demonstrating the potential of an intersectional approach that uses race, ethnicity, gender, ability, sexuality, and class all at once, for people experience these elements in an integrated manner. Roopali Mukherjee's *The Racial Order of Things* (2006) set the bar for intersectional analysis of the “post-soul” era. Tasker and Negra (2007) provide a comprehensive introduction to the political implications of postfeminist culture, while Molina Guzmán and Valdivia (2004) apply the intersectional approach to the study of celebrity Latinas. Joseph (2010), in her provocatively entitled “Tyra Banks is Fat!” (a title that, to be fair, comes straight out of tabloid magazines and television coverage), explores the implicit racism and sexism of the postracial and postfeminist veneer of reality television in general, and Tyra Banks's brand in particular. Molina Guzmán (2010) explores

the transnational deployment and commodification of the Latina body, both spectacular and everyday. The politics of the post appears in all elements of media studies as these scholars foreground media studies even as they situate their work within a broader context of geopolitics and the dynamically changing mediascapes. While it may be fashionable to suggest the end of media studies, just as others have previously declared the end of history or of ideology, what this encyclopedia convincingly illustrates is the field's ability to expand as new practices, technologies, and institutions arise. As many of the editors and contributors will document, "new media" is a misnomer as neither the technology nor the uses or assemblages are so new (see Morley, 2006). What at first may seem to be epochal breaks are revealed by many of the contributors to be far more continuous elements in relation to history, culture, and media.

Editors and Volumes

We begin with normative theories and history. **John Nerone**, author of *Violence Against the Press: Policing the Public Sphere in US History* (1994), co-author, with Kevin Barnhurst, of *The Form of News: A History* (2001), and co-author and editor of *Last Rights: Revisiting Four Theories of the Press* (1995), as well as author of many other journal articles and book chapters, is the perfect historian to lead us through this fertile terrain of scholarship. Volume 1 on history underscores that while all media have long histories, historians agree neither on the definitive tale of origin nor on the particular historical approach. Moreover, Nerone, the careful historian, alerts us to the fact that even our use of the word media in relation to communications is quite recent.

Nerone's volume includes normative and historical approaches. Historical research, drawing on normative frameworks or not, continues to offer media studies scholars great insight and tools with which to understand contemporary media. Furthermore, there is great diversity within historical approaches to media studies. Beyond cultural memory and special effects as components of media history, we are also witnessing an explosion of careful work that revisits the archive, data, and documentation. Kafka (2009) brilliantly studies that most elemental component of media – paper. It seems like such a simple task: how do we study the construction and use of paper, the "bureau" in bureaucratization, the work of scribes? Kafka concludes that: "As scholars continue to research the history of paperwork, we need to keep in mind that we are defending not only the 'historical record,' but the political one" (2009, p. 352). Indeed, these are the perfect words to keep in mind as we read the volume on history so elegantly crafted by John Nerone.

Volume 2, *Media Production*, is composed by **Vicki Mayer**. Among the many publications by Mayer, we can list *Below the Line: Producers and Production Studies in the New Television Economy* (2011), *Producing Dreams, Consuming Youth: Mexican Americans and Mass Media* (2003), and *Production Studies: Cultural Studies of Media Industries*

(co-edited with M. J. Banks and M. T. Caldwell, 2009). Mayer begins her volume by reminding us that “[M]edia production is frequently the most invisible aspect of our relationships with media. In the storm of media messages we encounter, we rarely consider where they came from, who made them, and how.” We expect to find, and we are not disappointed, a combination of keen attention paid to the sociological approach to our field, something about which McQuail had previously written in *Towards a Sociology of Mass Communications* (1969), and the more critical analysis of neo-Marxist political economy now accompanied by a focus on labor issues in the global setting. Moreover, as explicitly stated in one of her book titles, Mayer paradigmatically maintains a dialogue between political economy and cultural studies, an approach that resonates with globally used approaches in our field. The tension between structure and agency pervades this fine volume. Mayer remarks that “[I]f the focus on social structures has implicated the modern state in the study of media production, the focus on the agency that people exert over media production implicates the modern project to create enlightened subjects who can embody, perform, reflect on, and actually become media producers.” So the new production studies is global by necessity as transnational ownership and production of media industries cannot be denied; blends political economy and cultural studies; foregrounds issues of labor, both above and below the line; and takes up issues of networks, intellectual property, and subjectivity as producers are constructed in terms of categories of identity.

Sharon Mazzarella, a prolific scholar of issues of youth and the media, leads us through the wide world of “content and representation.” Author or editor of books including *Girl Wide Web 2.0: Revisiting Girls, the Internet, and the Negotiation of Identity* (2010), *20 Questions about Youth and Media* (2007), *Girl Wide Web: Girls, the Internet, and the Negotiation of Identity* (2005), and *Growing Up Girls: Popular Culture and the Construction of Identity* (2001), Mazzarella is a rigorously trained social scientist who also pursues qualitative research. As such she is the ideal editor for this volume, which is respectful of both of those methodological approaches. Indeed, for many a budding media studies scholar, content and representation provide the first point of entry, as these are the aspects of media that we experience most directly. Although, of course, all media have normative implications, histories, and a complex web of production, most people focus on the finished product: the television show, the movie, the blog, the social media website, the song, the newspaper, the advertisement, the catalogue. Content analysis is alluring yet amazingly difficult to carry out. Representational analysis also bears the sophistication of a range of theories. Neither is an easy task, and quantitative approaches complement interpretive studies. Mazzarella presents a persuasive argument as to why content/representational analysis remains an essential component of media studies and why projects that are well carried out tell us much about the world and the circuit of culture. Unsurprisingly, this area of research continues to be plentiful.

Radhika Parameswaran edits Volume 4 on audience and interpretation. Parameswaran’s research includes two long articles in *Journalism and Communication*

Monographs, “Melanin on the Margins: Advertising and the Cultural Politics of Fair/Light/White Beauty in India” (2009, co-authored with K. Cardoza) and “Global Media Events in India: Contests Over Beauty, Gender, and Nation” (2001). Her work has focused on the intersection of feminist cultural studies, gender and media globalization, South Asia, and postcolonial studies with a particular emphasis on issues of audience and interpretation. As such she constructs a volume worthy of her areas of expertise, with plenty of chapters illustrating global and gender issues. This volume also bears the traces of an interdisciplinary field that includes social scientific paradigms such as uses and gratifications as well as more humanist approaches that now include global and online ethnographies. Parameswaran remarks that “audience studies has not only survived the backlash against its populist tendencies in the late 1980s to mid-1990s, but it has also thrived and expanded to include a range of audiences, media genres, modes of audience engagement, and institutional and international sites of reception.” “Populist tendencies” refers to the “discovery” of the audience around every corner, as it were, without proper attention to issues of power and structure. In the contemporary moment, audience studies is vibrant and innovative. Whether we look at fans or online digital communities, to mention just two of the many possibilities, the construction and potential agency of the audience are major issues that continue to guide the production of media and subjectivities. Illustrative of the many philosophical quandaries undergirding the location of the audience within media studies is Jack Bratich’s chapter in Volume 6, as audience analysis is part of the present and future of the field. In addition, audience connects with issues of production as it undeniably takes labor to be part of any audience.

Erica Scharrer guides us through the fifth core component of media studies, media effects and media psychology, the dominant paradigm in the United States as well as in other global settings such as the Netherlands, and the paradigm that reaps the most funding in a positivist framework that values scientific demonstration of impact. Scharrer has co-authored, with G. Comstock, *Television: What’s On, Who’s Watching, and What it Means* (1999), *The Psychology of Media and Politics* (2005), and *Media and the American Child* (2007), and, with L. Weidman and K. Bissell, a long article in *Journalism and Communication Monographs*, “Pointing the Finger of Blame: News Media Coverage of Popular-Culture Culpability” (2003). Scharrer brings to the volume on media effects/media psychology a long-standing engagement with the social scientific paradigm in our field. A well-carried-out effects study tells us much about the influence of media on individuals, groups, and societies. The field of media effects, therefore, is presented with both the challenge and the opportunity to sort out these complex and potentially idiosyncratic experiences in a context in which the number of media outlets has proliferated, their use occurs at virtually any location and time of day, and their consumption and purposes intersect and converge more than ever before. Thus Scharrer asks: “Why are individuals drawn to media to such impressive degrees? How do they process and make meaning from media messages? What types of content are they both receiving and creating when spending time with

media? What are the consequences of such media use? What factors and conditions help explain why individuals vary in their responses to media? And what factors and conditions may moderate or mediate such responses?" These questions require complex methodological and theoretical expertise to answer. Many of us were schooled in a critique of the "hypodermic needle" model, though we have since learned that the media sometimes have or generate direct effects. Why else does a multibillion dollar advertising industry exist in the United States? However, we continue to marvel at the long-term cumulative effects that are far more complex than we originally anticipated. Furthermore, effects scholars, such as many of those contributing to Scharrer's volume, seek to explore how to effect positive change as well as how to avert more nefarious outcomes.

Finally for now,² the encyclopedia concludes with Volume 6 on media studies futures edited by **Kelly Gates**. Gates's own research is the veritable embodiment of a focus on futures. Author of *Our Biometric Future: Facial Recognition Technology and the Culture of Surveillance* (2011) as well as co-editor with Shoshana Magnet of *The New Media of Surveillance* (2009), Gates studies the discursive formation of the wishful deployment of recognition technology with an "almost gleeful futurism" that suggests "if only" the systems were in place, before 9/11, for instance, our present and future would be different, better, and so on.³ Futures is, by definition, a transient category, as within 10 years the content of this volume will be the stuff of the present, or maybe even the recent past. As Raymond Williams has written, we cannot anticipate what will be an emergent media form until it is *post facto*. The futures volume takes up some of the issues around Internet, gaming, social media, mobile telephone in a converged media form, biopolitics, and digitalization technologies such as biometric body scans. Gates asserts that media studies needs to take seriously the possibility that *radical uncertainty and contingency* are the only features that define where media are and where they are headed. All of the chapters in this volume could be retrofitted into the other five volumes. Yet together they compose a vision of the field as it moves forward, taking up issues that date back centuries, engaging them with theories and modes of media that only apparently represent new terrain.

This is the state of the art of media studies. It is a field where we know better than to use the term "new" media – for all media are somewhat new but also very old in many of their aspects. Scholars in this encyclopedia take us back to the production of paper even as they bring us up to the latest technologies, assemblages, and institutions that arise to mediate our world. Contributors to this encyclopedia share the belief not only that media studies is an academic exercise, but also that by engaging in this important area of studies we are somehow contributing to a more just vision of the world. As the separate volumes build on each other, whether we are engaged in media at any of their analytical nodes (production, content and representation, audience and interpretation, media effects/media psychology), we are simultaneously linked to its history and its future. As a diverse heterogeneous field that is global, interdisciplinary, intersectional, multi-methodological, I cannot imagine a more exciting and potentially liberatory academic enterprise to be involved with.

NOTES

- 1 In this introduction and whenever possible, this encyclopedia uses “America” to refer to a continent and “US” or “United States” to refer to the country, unless we are quoting from scholarship that uses “America” otherwise.
- 2 A *Methods* volume is projected to be released at a later date, edited by Fabienne Darling-Wolf.
- 3 Few people know that Gates submitted her dissertation proposal the day before 9/11. What to the committee seemed like futuristic queries became the very real present within a period of 24 hours.

The Governance of Communication and Culture

Regularizing the Regimes of Production and Consumption

Katharine Sarikakis

ABSTRACT

This chapter explores the role of communication and cultural policy in regularizing changes in the regime of accumulation and in the processes of production and consumption of cultural goods. It explores the emergence of new geographies of power in decision-making and the people in production and consumption who define the ways in which the circulation and accumulation of cultural goods and profits is developing. Working with definitions of cultural policy and the European experience as a geography of political and political-economic power for decision-making, the chapter places Europe in the continuum of global production/consumption in the digital age.

Introduction: The Changing Landscape of Media and Culture

A careful look at everyday life in the twenty-first century reveals the centrality of media and communication as forces facilitating democratic processes and participation, cultural expression and exchange, or economic activity – at local and national levels as well as globally. The governance of these institutions has increasingly

The International Encyclopedia of Media Studies, First Edition.

become a matter of interest not only for policymakers in the field of culture and media, but also for various industries that, until recently, were only very loosely associated with this field – such as electronics, or even transportation. Behind today's world of multiplatform media usage and attention to cultural–civic experience stands a complex web of industrial and political interdependencies organized around the understanding – and conscious position – that media and culture industries constitute the source of new market activity and profit.

In particular, “culture” has gained ground as a legitimate area of political activity and decision-making in the past 20 years, invariably echoing economic arguments about lifting the economies of postindustrial, service-based Western societies. The European Union (EU), arguably a micrography of globalization processes on a specific, territorial terrain, accepted “culture” as a legitimate area of the polity's jurisdiction, largely because the economic–financial potential of cultural activity could be incorporated in the agenda of market liberalization on the continent. Within this framework, media and communications are inextricably linked to the broader culture industries, with media technologies occupying a central place in the governance of culture. This should perhaps come as no surprise, as media technologies are not only the drivers of many forms of popular culture, but they are increasingly integrated and embedded in practices of high culture and the arts, often making the boundaries between “popular” and “high” culture less visible, as the arts are being reconstituted as economic forces and as avenues for the regeneration of cities (Massey, 2010; Sarikakis, 2012; Sassen, 2002). Therefore populism and high art – historical rivals – have become more interlocked through the use of media technologies to the purpose of enhancing the audience experience (theaters and opera) or of producing works of art that incorporate the media themselves or art that is the medium, such as self-made nonprofessional anime videos – especially in the era of “remix” culture (Lessig, 2008).

Moreover, in the new millennium, culture becomes part of the information sector in all major economies, which are led by the US and by the EU. Certainly, the renewed interest in cultural products does not mean that cultural policy did not exist before the days of neoliberal governance – the so-called “information age.” But the discourses and the public presence of policy debates attained a different emphasis, one that is ideologically based on the function of culture as a generator of capital accumulation. Beyond economic aims, however, parallel debates on cultural governance seek to highlight culture's pivotal role in knowledge creation and sharing, in democratic participation, and in human emancipation. This global-level international policy debate developed among civil society organizations and international organizations such as UNESCO (Frau-Meigs, 2011). The debate has aimed to bring back the role of culture in the lives of communities, societies, and individuals – namely its role in promoting social cohesion and integration, well-being, and expression; indeed it has aimed to revisit culture-related rights as human rights. Consequently (or subsequently), cultural policy has become a distinct area of interest for policymakers as well as for culture industries themselves – a phrase that, in the context of this discussion, refers predominantly to the media industries in their established and

newer technologies. The discussion that follows explores the ways in which culture, cultural production, and cultural consumption have become subjects of intense regulatory change, and it maps these changes.

Global Regulatory Shifts: Priorities and Tensions

The governance of media and of culture has known an unprecedented shift, in particular in relation to the technological means of information and expression. The landscape of global media and that of communication have changed dramatically in the past two decades, having impacted upon and having been in return stabilized by the disintegration of market and financial borders, by the integration of markets, by global regulatory steering mechanisms, and finally by often unexpected or unintended uses of media technologies. These changes are both structural and systemic – in that they determine the shape and organization of media, communication, and culture industries. They are also changes at a symbolic and formative level – such as can be found in the character of governance of media and culture, and even in the ideological, normative *raison d'être* of their forms, as in the case of public service media. Consequently, the current environment of media and culture production is determined by changes in regulatory priorities, philosophies, and practices that took place across the world in the past two decades.

In principle and under the form of directions to be followed and applied according to local, national, and other regional contexts, a media and communication policy shift has taken place globally. Regulation came to establish – in a normative and legislative, hence in a legal way – changes in the practice of media operations, a continuous process that started in the late 1970s and early 1980s. In particular, the shift cemented new business models and transnational operations organized around the introduction of satellite technology and around the development of the electronics industry; it also cemented the first steps toward the popularization of Internet technology, by allowing flexible connections across time/space.

These shifts belong in the broader context of neoliberal governance. As cultural geographer David Harvey argues:

The corporatization and privatization of hitherto public assets (such as universities), to say nothing of the wave of privatization (of water and public utilities of all kinds) that has swept the world, indicate a new wave of “enclosing the commons” [. . .] The reversion of common property rights won through years of hard class struggle [. . .] to the private domain has been one of the most egregious of all policies of dispossession pursued in the name of neoliberal orthodoxy. (Harvey, 2003, p. 148)

Neoliberalism as a political philosophy for the organization of social life on the principles of the free market was revived in the US and in the UK around the same time,

in the early 1980s, influencing the politics of international organizations such as the World Trade Organization (WTO) and the General Agreement on Trade and Tariffs (GATT), but also the political steering of many countries. In the process of furthering the possibilities for capital accumulation, the media and culture sector offered a great terrain, only partly exploited. Supported, among others, by large transnational corporations of communication technology – which were active not only in the arena of public communication, but also in that of military communication – neoliberal economists and politicians pursued the structural alteration of the organization of the market. For that process to take place, it was required that the state change from its Keynesian role in economy to one of minimum intervention in the market, and that this change be implemented by administratively removing the mechanisms of control over the daily operations of transnational capital. Overall, systems of self-regulation and co-regulation that are largely dependent on industries' own terms of reference replace central regulatory frameworks.¹ Harvey (2010, p. 54) writes, characteristically, that the “state–finance nexus” has long functioned as the “central nervous system” for capital accumulation.

The major paradigm shift consisted of the following changes:

(a) The media landscape was transformed structurally so as to limit the reach of public service broadcasters (PSB) in the audience “market” – and not only for countries where PSB were a monopoly, but also for countries with a dual system of media that included private broadcasters, such as the ITV in the UK. The media landscape became a volatile market whose major actors were the ones who could derive financial resources from other operations, as the case of the UK has shown (Freedman, 2008). It was during this period that Europe's symbolic and cultural centers were shifting; this was due to the development of the London media hub, where the seat of media corporations spiralled with the attachment of media-related businesses. The development of new markets was achieved.

(b) The airwaves – which were part of the “commons” and hence a vital communication resource, until then considered public property – were privatized with the introduction of commercial broadcasting channels. Telecommunications followed the same pattern, with the “auctioning” of the spectrum to the highest bidders (Crow, Longford, & Sawchuk, 2008; Streeter, 1996).

(c) The citizens, who formed the public, were referred to as consumers and audiences of media products. This way the relation between the public on the one hand, the media and culture on the other is treated differently in policy decisions about access, universality, or other related rights to cultural goods. The predominant logic is one that defines this relation as a commercial, transactional one.

(d) Furthermore, processes of technological convergence have been dealt with as largely technological ones. Sociocultural concerns are limited to certain “moments” of end-use of media technology (such as access to computer terminals and the Internet) as well as literacy in the basic usage of communications. These are “instances” that are not always contextualized within the broader conditions of

cultural values and capital, economic resources, or other social disparities. It is argued that the policies of the information society treat citizens according to their purchasing power, in other words they regard the public as customers in the purchase of electronic items. Hence citizens are categorized according to their ability to participate in the digital market (Chakravartty & Sarikakis, 2006; Murdock & Golding, 2004).

These profound changes have taken place not only in the immediate environments where we experience media and cultural products – which are in rather localized and specific contexts even when we are on the move, for instance at home, at our computer, or in the street, on our mobile phone, in an Internet café, or in a media art installation exhibition. They have also taken place in ways that reveal the construction of new political and economic geographies that transcend our localities and that are global in reach, as cultural and media artifacts are to distant and multiple publics. Media and communications have transnational dimensions in relation to their users and audiences, as the latter form bonds across borders in the form of diasporic connections or other sociopolitical networks. Finally, while the cultural and political-economic dynamics of the media are located in global, transnational, and local dimensions, their governance has increasingly shifted toward supranational terrains – such as the EU, which is one of the most developed multi-actor policy regime – and has become integral to international policy regimes – for example summits and trade agreements.

International policy regimes are those interrelations between states, private actors, and third-sector actors that can include any kind of combination among these actors. The theory of hegemonic international regimes derives from the discipline of international relations. Among international relations scholars, critical realists like Grieco (2002) believe that international regimes are based on the hegemonic power of certain actors and rely on it for their establishment and continuation. So far as our discussion of media and cultural policy is concerned, the US would be a hegemonic power in a position to steer policy within regimes of international cooperation. The US is followed closely in certain domains by the EU and by certain transnational corporations. According to this theory, media giants like Microsoft, General Electric, or News Corporation would be central in maintaining specific policy priorities at a global level. International policy regimes also refer to the constellation of policy-designing powers like the G7/8 or of organizations like the International Telecommunications Union and the World Intellectual Property Organization.²

Initially, international regimes consisted predominantly of states; but this, too, has changed in the era of multi-stakeholder organization of policymaking. The World Summit on Information Society (WSIS) (2002–2004) – the only summit on media after the New World Information and Communication Order (NWICO) initiative taken by the United Nations Educational, Scientific and Cultural Organization (UNESCO) – was part of such a policy regime (Chakravartty & Sarikakis, 2006). Despite the fact that the summit was not designed to make policy but to

debate priorities for the development of the information society,³ it did result in the establishment of another global policy debate forum. The Internet Governance Forum, which derived from the WSIS, was an international forum aimed to debate contemporary policy questions about the Internet – but, again, “not to make policy” (see Internet Governance Forum, 2012). The trajectory of the governance of the information society therefore seems to be based on the combination of actions (not always or necessarily in a consistent or permanent formation) and principles set in a series of meetings of a selections of states. This starts with the Brussels meeting of 1995, which set the policy principles for the information society and its US counterpart, information superhighway; the series of meeting continued with the G8 meeting in Okinawa in 1998 and with the WSIS process. It is interesting to note that the global alliance for electronic commerce, a powerful private-sector global lobby actor, has been systematically present across these series of meetings and liaised with participating governments over the kinds of policy directions that an international Internet policy regime would be expected to follow. Therefore the process of policymaking, until then largely a national state-led affair, was reformed to include various “multi-stakeholders,” as decision-making expanded gradually to international levels.

Furthermore, the changes emerging at the global level concern the *types* of regulatory models promoted with regard to media and culture, as these are not simply the sum or amalgamation of national policies, but rather (and to a great extent) models valid on the international scene beyond the nation-state. These models set the principles of regulatory directions and the background against which media and culture are governed in national or regional settings. Moreover, these changes reveal that the reconfiguration of the role and function of media – and of culture overall – constitutes a core element in a large-scale reorganization of the form of capitalism.

To scholars of international regulatory change, the political economy of the markets is a determining factor in the development of policies in two major ways. First, markets regularize and normalize in a normative manner the changes that have already taken place prior to law. Second, markets determine future policy – not necessarily as a matter of prescribing it exactly, but by limiting the range of options that it can derive from. For example, through the involvement of private global corporations in policy design, priority has been given to policy choices that favor a neoliberal, privatized form of media ownership, while community and public service media have effectively been treated as “add-ons” to a predominantly private media system.

In communications, culture, and the media the transformation of governance has three identifiable phases:

(a) A phase of *devaluation* of previous paradigms through economy-framed and political discourses, accompanied by the formulation of a set of “principles” and guidelines for policy direction in international forums like the G8, as well as in subject-specific summits and other international constellations. These principles are adapted according to geopolitical, historical, and other dimensions of localized regulatory systems. For example, European and American jurisprudence are different,

and so are historically set ways of politics. It is important to note that only certain countries and their states are in a position to lead this process.

(b) A phase of *de- and re-regulation* follows (not in strict chronological order) the set principles that are supported normatively, on the one hand on the grounds of the crisis of the welfare state and of Keynesian economics, and, on the other hand, through a discourse of technological inevitability. Both phases are considered phases of change and crisis for the existing regulatory framework.

(c) *The stabilization and normalization* of the new status quo in its regulatory cementing achieves an ideological/normative justification that lends legitimacy to these changes and confers predictability to the political and legal situation, which is necessary for capitalization on previously not owned assets. This is the longest of the three phases, because it functions not only as a reevaluation process for the new commodities (media and culture products), whose financial beneficiaries exclude the public. It also functions as the new regulatory (and regularizing) establishment, which leads to further processes of commercialization and marketization of the emergent media and cultural phenomena.

It is important for media production scholars to concern themselves with policy relations and with the processes and outputs of media production. In particular, attention should be focused on the core characteristics of communication and media policies as sites for struggle among competing and conflicting interests, but also as processes that themselves constitute cultural products inasmuch they express dominant ideas, values, and understandings.

Hegemonies of Cultural Policy

The shifted frame of culture and media governance entails all those processes and actors involved in the shaping of the conditions under which the production and consumption of culture takes place. These include dominant understandings about a legitimate agenda for debate, the definition of the policy problem, structural arrangements that impede or encourage pluralistic expressions in cultural production, and decision-making processes. Cultural and communication governance can be mapped across three axes that capture its relation to citizens, and their relationship with the state and communication organizations.

The following factors are catalysts of transformation for the relationship between the act of public speech – as something that cultural production may be understood in its broader sense – and the citizens:

- 1 Intensified globalization is directly dependent on speedy, internationally integrated communication systems and on media systems that are firmly operational in required localities.

- 2 Globalization accelerates the transformation of the state, through the emergence of a world political order, albeit in problematic terms with regards to access to and participation in the processes of decision-making.
- 3 Information and knowledge in postindustrial societies are increasingly treated as commodities and subject to proprietary legal frameworks – in particular that of intellectual property and copyright.

As policies represent the dominance of hegemonic discourse and ideas in particular historical moments and contexts, they also reflect tensions – they express conflicts and visions, political histories and styles of governance, democratization, and commercialization.

“Culture” as a distinct policy object of the neoliberal agenda gained prominence in Europe in the 1980s, as part of the efforts for urban regeneration, and at an EU level with the establishment of the European City of Culture in Athens in 1985 (Sassatelli, 2009). For the US, cultural products have always been part and parcel of its foreign policy, not always in a systematic manner, but certainly as means to persistently open barriers for its products, especially where the US government had influence in the domestic politics of other countries. Katya Johanson (2008), discussing Australia’s cultural policy experience, argues that it existed well before the rise in interest in culture as industry. Hence there was continuity in bringing cultural industry discourses in line with industry policy discourse in the 1990s, which included support for the arts as an industry and for the rejuvenation of depressed urban centers. Characteristically, as Johanson states, in the postwar era the tertiary sector had increasingly occupied 40% of the labor force. As early in the life of the EU as the 1960s, culture was considered part of its international diplomacy – among its member states and in its relations to the outside world. US production policies were directed toward re-establishing and maintaining a dominant position in capturing European audience shares through international negotiations to open their markets, lower production costs (taxes, operational, and administrative costs), and to standardize regulatory frameworks.

At the same time culture has been a point of contestation and struggle for hegemony vis-à-vis the “American influence” and its role in the making of postwar nations. Not dissimilarly, Europe’s nemesis placed a lot of attention on the economic and diplomatic significance of European culture industries. American cultural exports of film and of popular culture were understood to represent favorable aspects of US politics. In a discussion of the historical role of the American film industry in Europe, Ian Jarvie (1992) shows the pressures the US industry put on its government to promote free-trade zones, fewer barriers, and wider distribution through its negotiations with foreign nations. The European nations were a particularly important market – as they are today. They, too, were designing cultural policies that included various systems of quotas, tariffs, and import taxes on foreign films. For example, France, Britain, and the Dutch governments were in favor of protectionist measures, even of systems of state monopoly purchase to control the outflow of exchange

currency, which at the time was an important resource in cash-stripped Europe. In response, the American movie industry lobby employed a new rhetoric to re-establish its legitimacy and therefore to recover lost profits and the dominance it enjoyed in prewar Europe (*ibid.*).

Culture was the cornerstone for cultural understanding among the continents as well as the vehicle for the development of cultural affiliation with American ideologies (and hence the dominance over communism). The issue of quotas appears in the negotiations for the International Trade Organization (ITO) and for the General Agreement of Tariffs and Trade (GATT) very early on, as an integral part of Europe's cultural policy and international relations. However, culture operates within the context of capitalist economy. To pursue favorable conditions for entry into the European market, the American movie industry lobby, in one pre-emptive strike, raised the issues of contingents, visas, exchange controls, and bilateral agreements in the negotiations over the ITO and the GATT throughout 1946 and 1947 (*ibid.*). The industry was opposed to such measures, favoring borderless arrangements that would allow it easier entry to European markets. Quotas as a policy measure for the protection of European film production became points of reference for conflicting interests, even among European countries, France being the strongest advocate and Britain the weakest. But this was not always the case. The British Cinematograph Films Act abandoned the policy of protectionism for their film industry in exchange for the US' commitment to purchase British products (*ibid.*, p. 281).

The aim of GATT has been free trade, approached as a phased process of tariff reductions. Its European project was to create an integrated market for American cultural products. To do this, one of its priorities was to "internationalize" Hollywood business by contracting local employees – indigenous talent and émigrés – and by shooting in foreign production locations. Another priority was to push distribution and exhibition agreements. It became easier to push toward specific policies that facilitated the distribution and consumption of US films in the countries that "owed" to the US due to the Marshall Plan. This was particularly vital for the US economy, as 40% of the US movie industry revenue depended on overseas sales (*ibid.*). In terms of theater ownership, US production companies had already solidified their connections before the war, changing little even 50 years later. These dual-policy aims show that production goes hand in hand with distribution and ownership of the theaters. These economic and social interests continue even today in international negotiations with the audiovisual culture industries and with the EU. Quotas, as a primary policy tool, extended to include television and other audiovisual media. Although large media corporations have solidified their control over these markets today (McChesney, 2004), there is a wider diffusion of production networks. This may give the appearance of political flexibility, pluralism, and a diversity of interests in the negotiations.

Still, the policies presume ownership concentration as a dominant form of the organization of media and culture industries. This presumption has specific effects on the quality of media programming and content in terms of their quality of

production, their reliance on “tested” format and storylines, the ways in which the stories change in order to appeal to mass audiences, and so on (Baltruchat, 2010). Ownership concentration in the media not only leads to the homogenization of content and to production of content of the lowest common denominator, but also contributes to the marginalization of unprofitable styles, languages, themes, ideas. In the EU, the problem of ownership concentration is an unresolved policy issue. For over a quarter of a century, attempts to formulate policy at a European level have failed, despite repeated initiatives from the European Parliament as well as from professional and civil society organizations (Doyle, 2007). The subject is not closed yet, but there does not seem to be any substantive change of course. Instead “monitoring” committees and “special” mentions are offered as symbolic gestures toward pluralism in the media. The resulting media economic landscape is, clearly, an oligopoly, the most dramatic examples being present in Italy and in Eastern Europe.

In connection with media ownership discussions, the EU has turned its attention to deeper dimensions of culture in policy, including linguistic pluralism, cultural citizenship and cultural expression, media diversity, and the relation of ethnic minorities to the media (Doyle, 2007; Sassatelli, 2002, 2007; Tsaliki, 2007; Zabaleta, Xamardo, Urrutia, Gutierrez, & Mendizabal Etxabe, 2004). These policy areas are important in that they raise questions about the strength and degree of commitment and political will, in contemporary Europe, to protect alternative forms of cultural expression. They also reveal assumptions about what constitutes Europe. Cultural policy in the EU became certainly more sophisticated in these respects through funding provisions for the development of production, training, collaborations, and recently distribution of “European works” through the programme MEDIA (see European Commission, 2012). This programme was established together with the introduction of the Television Without Frontiers, the main audiovisual common policy of the EU, which applied the single-market principles in the cross-border movement of cultural services and products. Now in its third reincarnation, the EU Audiovisual Services Directive reflects the tensions in supporting the mediation of cultural expression on the one hand, and the corporatization and privatization of cultural products as trade goods on the other (Sarikakis, 2004).

Despite its neoliberal and predominantly market-focused direction, cultural policy has also played another role in contemporary Europe. It is seen as the vehicle to reconstruct the new Europe. Its importance in political thinking and political integration has been identified early on, in parliamentary debates in which culture is viewed not only as a profit-making machine, but as a unique form for an “industry.” This duality is one of the major sources of conflict, in the media and in cultural policy in the EU, between those who think that cultural products require special measures and provisions and those who prefer a strictly market-based approach (Sarikakis, 2004; 2007a, 2007b). “Culture,” and hence cultural policy, gained legitimacy and legality as an EU jurisdiction with the Maastricht Treaty. There is, to a great extent, a common understanding that neoliberal approaches to the construction of Europe are detri-

mental to its cultural identities and to their survival. In these terms, the protection of cultural goods and services that derive from diverse national and cultural contexts becomes politically important, as cultural expression becomes inextricably connected to citizenship (Germann, 2005, 2006). For any society, cultural goods produced under neoliberal conditions are not conducive to an autonomous and genuine negotiation in the construction of identity. This question is in turn related to sociocultural dimensions of citizenship along cultural mediations of difference and sameness. The EU's cultural policy has failed in many ways to fulfil the need for an anthropological understanding of culture that would also include a proactive pursuit of social cohesion and recognition (Sarikakis, 2005, 2007a, 2007b). Article 151 of the Maastricht Treaty of the EU recognized culture not only as factor of diversity as *experienced* among "legitimate" European publics, but also as a critical junction for migratory populations and for populations of a minority status. Cultural policy as such has fostered particular visions of "a" European identity (Sassatelli, 2009).

Furthermore, the role of cultural policy extends beyond the borders of the EU, as it affects nonmember states through policy adjustment for those countries that want to become members, and through indirect policy reform for those that are at the receiving end of development, collaborative, and other funds released by the policy (De Smaele, 2007). Expansion of the EU brings the expansion of regulatory regimes to accession countries that are shaped by neoliberal strategies for the exploitation of untapped markets, a process that makes visible its impact on the privatization of media and culture industries, structures, and technologies. An integral element in the strategy of privatization of public cultural assets has been the withdrawal of support from PSB systems and a systematic process of administrative scrutiny that is disproportionate to that enforced on private corporations. Through the application of competition mandates, unfavorable conditions for PSBs are mixed with rhetorical support of their importance for democracy and social cohesion (Humphreys, 2007; Munoz Saldana, 2008). Controls over media development plans derive largely from the expectation that states cease to support PSBs. In the EU, repeated attempts to interrogate and interpret the Treaty of Amsterdam, amending the establishing treaties of the EU as an economic Magna Carta for European media, have resulted in a system whereby PSBs are tested for their public service obligations against the competition market. PSBs are placed in disproportionate scrutiny in relation to commercial broadcasters for the quality of their programmes; but, most importantly, the costs of such tests are carried by the PSBs themselves, and ultimately by the public. These costs can be very prohibitive for small nations. Private media are not obliged to prove their corporate social responsibility or to provide transparency with regard to their accounts and chain of management.

Although accountability for the spending of public money should be integral to the operations of a public service corporation, it is important that this process does not hinder the development and future survival of this corporation. In the UK, the proposal to slice the license fee of the BBC gained momentum within the context of undermining the normative support for the BBC. As soon as the conservative-liberal

coalition took over in 2010, it was able to impose sudden and drastic cuts on the BBC as part of its “austerity package.”

The significance of PSBs around the world continues to reside in their role in bridging cultural differences and class divides by bringing access to information and education to the masses. Across all continents and for over 40 years, their role in supporting democracies and cultures despite the public broadcasting system’s shortcomings has been well documented. In areas of the world where the process of democratization continues, PSBs are cornerstones of culture in the production and distribution of universally accessible material. Today their innovative production approaches, their mission toward creating genuinely original, diverse, and domestic programming, and their support for independent culture-making can be seen in a series of declarations setting the international standards for PSBs (Sarikakis, 2010). Superlative expressions of neoliberal policy, which are based on the control of the media and culture markets through private ownership, are at odds with these aims.

Noncommercial, Nonprofessional Culture and New Policy Regimes

The private ownership of media and cultural production has new dimensions in the digital era, which transform the regulatory protection for certain kinds of ownership while raising important questions with regard to the impact of these changes. The postindustrial *qua* “informational” era of capitalism is characterized by a culture and media policy that is heavily oriented toward the control of copyright in digital environments. Both the internationalization of media and culture industries and the technological convergence of the media are posing further challenges to the regulation of the sector. In terms of intellectual property and control over copyright, new regimes are emerging whereby digital or digitized content is subject to different rules from those that govern the conventional (analogue) content. This is compounded with the technical capability to control the range and frequency of uses of digital content.

The configuration of copyright regimes in the digital marketplace is designed to derive profit from existing and new cultural activities/products through the management of the consumer and by changing the dynamics of the production and consumption of cultural goods. The importance of culture in creating a new market and in sustaining the information society cannot be overstated. In his book *Exploring the Sociology of Europe*, Maurice Roche refers to Europe’s “cultural capitalism”:

The continuing ICT revolution gives a massive new and dynamic role to what are essentially cultural phenomena, namely information and knowledge, and essentially cultural processes, namely communication, in all dimensions of society, including the economy [. . .] [cultural industries] represent major and growing sources of GDP and employment in contemporary advanced economies, both across Europe and around the world. (Roche, 2010, p. 175)

For early Internet adopters such as the members of academic and librarian communities and for those users who “grew up” with it, the Internet appears to be the domain of freedom: freedom to express oneself, to exchange ideas, to explore culture, to make culture, to develop social network, to organize civic action. For copyright holders of cultural and informational products, however, the Internet represents a threat to the viability of established business models. This is different from a threat to business generally, despite the industry’s claims about losses. The rights holders’ problem seems to be that unlicensed Internet download of popular culture products such as songs, films, or electronic books antagonizes sales of physical items, which decline. Whether this is exactly the case is debatable, as the industry itself recognizes that there are new models of business being developed and new ways to monetize users’ developing relation with new media (ELIAMEP, 2009).

The more pressing question here is to what extent copyright regimes should be applied in the online environment. Is it time for the coexistence of provisions that allow a freer circulation of content without punishing – or, worse, criminalizing – the consumer? In many ways, the power struggle over “illegal” downloading, to use the industry’s framing, is odd. Most cultural products can be found “recycled” (used/like-new) through individual sellers in online “marketplaces,” for example Amazon or E-bay, for as little as £0.01. These sales generate income for E-bay and Amazon, not for rights holders. The point is that the life of a cultural product can be very long, but also very unprofitable. Peer-to-peer exchanges and other forms of downloading function to disseminate cultural products as a way of reconnaissance with newer cultural forms, with lower economic risk.

At the same time, the change in the consumers’ relation to the cultural products they consume (even if “unauthorized”) is linked to the profound changes that are taking place in the making of nonprofessional and noncommercial culture. Cultural producers are now encountering severe restrictions in their work. In the analogue world, copyright was not something users of information and culture had to think about; it was rather the concern of music publishers, librarians, and Hollywood lawyers (Lessig, 2008). In youth cultures of yore, for example, “mix tapes” were considered a thoughtful and special present to give someone. Now, mixed media infringe copyright. While the practice of making a mix tape was not necessarily ever in line with copyright laws, Lawrence Lessig (2008) asserts that the difference between then and now lies in the fact that the practice could not be monitored or policed. It did not make sense to go after consumers in this way. Besides, it was also a creative process; no two mixed tapes were the same, unless they were copies of each other. The process expressed emotions by was of putting together selected songs; it was a word-of-mouth promotion of songs and bands and a practical way to arrange one’s collection in a mobile format, to use it when on the move.

Today this very same act, in different media, is subject to monitoring, policing, and an increased frenzy among multinational organizations intending to “fend off” threats to their intellectual property. The art of remixing – or collage – and even the art of satire are under threat. Every single use of material is subject to explicit permission unless the copyright period has expired, which varies in duration according

to form. Musical copyright expires in Europe earlier than in the US. Book copyright expires later than music copyright, and so on. In the hyperbolic new media environment, digitalized material or material directly produced in digital form can easily be traced if it is used in derivative works such as collage, video clips, or short films. What was previously practically possible, permissible, and legal with “lesser” technologies is now criminalized, if it is created through new technologies.

At the time when technologies have seemingly democratized creativity and cultural production, the structural frameworks of law and the market seek to criminalize this technological democratization. Extreme stories of overzealous copyright holders have been well publicized, for instance the capers of those pursuing royalties from the Girl Scouts for singing songs around campfires. In another case, a group of Swathmore College students were prosecuted because they published 15,000 emails and memos that leaked from Diebold Election Systems (DES). DES runs the electronic voting machines used in the 2000 US presidential elections, which resulted in the electoral victory of former President George W. Bush. The stunt exposed the flaws and problems in the company’s software and security, but it was also deemed to infringe the company’s copyright according to the US Digital Millennium Copyright Act of 1998. The decision resulted in the college taking down the messages and effectively silencing the students without even a court procedure (Boynton, 2004). The effect of these cases has been chilling for all the citizens who make and distribute “culture.”

The advent of all kinds of communication technologies, and in particular of those with the capacity for converged, digital communication, generated the reproduction of existing goods while dictating the possible production of future goods. New digital media allow the download and storage of – theoretically – an infinite amount of material. Some critics say that any act of using content is an act of copying. Other critics say that, given the technological superiority of our times, “copying” as a practice has lost its meaning. In any case, these critics are worried about what they see as the progressive silencing of cultural producers and of their public speech. Lessig and Siva Vaidhyanathan characteristically argue that cultural remixing has been historically free of regulation, whether through the adaptation of original works or the retelling of stories in order to emphasize different people’s perspectives.

One such modern form of nonprofessional, noncommercial creativity is music videos that are made by fans of anime. The Anime Music Videos website (see <http://www.animemusicvideos.org>) counts several hundred thousand members who create video clips from remixing cartoons and songs to make new themes and videos that tell a story. Factual information can be mixed with fictional imagery through the use of sophisticated animation software. Fans typically create their own stories on the basis of their favorite anime characters, but they can create powerful political commentaries too. The amateur context within which these videos are produced means that they are clearly defined as personal creations, not for profit. The productions demonstrate skills and knowledge, as well as the depth of the producers’ “fandom” in showcasing their abilities. The music used in these video clips is taken without any regard for copyright, at least until recently.

In 2005, the recording company Wind-Up sent Anime Music Videos a cease and desist note, meaning that it wanted all videos using work of its artists to be withdrawn from the site. At the time, this amounted to almost 3,000 videos and translated into thousands of additional hours of creative labor by people who love anime and creative production. As one fan noted: “The corporate cycle is consuming the ‘creative’ cycle – [ergo] all is right with the world” (Otohiko, 2005).

In the digital age, consumers are a locus for creative production. Fans, as a subgroup of consumers, depend on the use of preexisting works under the control of copyright holders – in most cases, large and powerful publishers. There are legal protections for “transformative” work, meaning work that differs significantly from the originals it uses and/or provides new creative material. Challenges posed through cease and desist letters, however, place the onus of responsibility largely on the creators to prove their work to be transformative – a definition that is often found elusive. The patenting of ideas and knowledge as a form of property right and intellectual property is raising doubts about the usefulness of such protection for the public good and for the development of new ideas and technology in the short and the long term. The impact of cease and desist letters can be chilling for users and societies across the world – with potentially profound consequences.

The Future of Culture

The quality of the governance of media and culture is located on the interface of two levels of governance. First there is a macro-level of information and communications policy that regulates private and public actors, such as the communications and cultural industries. Second, there is a micro-level of control of cultural and communicative expression, manifest in the regulation of individual behavior. In both arenas, the delimitation of boundaries and conditions of activity for corporations and people takes place in fundamentally different ways. On a global scale, there is light governance of transnational industrial activities, whether through policy processes, in their actual media production processes, or through their interactions with consumers. Private actors’ actions also have a regulatory character, one that is *normalizing* the cultural and media sector’s *public* activity, especially when this brings changes to, and challenges, existing legal frameworks. Examples include the liberalization of commercial media, the light-touch regulation of production processes, the transnational trafficking of private data for e-commerce, the international trading allowances, and the concentration of ownership (Artz & Kamalipour, 2003; Braman, 2004; Chakravartty & Sarikakis, 2006; Mosco & McKercher, 2007; Sarikakis, 2010). On a national scale, the state governs people by focusing on *private* behavior, for instance individual wrongdoings, and it does so through intellectual property and copyright policies, privacy, censorship, and the monitoring of Internet usage (Bonetti, 2003; Sarikakis, 2004; Sidak, 2004; Zittrain, 2005).

A new set of legal principles adds to the oddity of this already complex set of conflicting interests in governing digital media. The principles of private initiative that lead in the sphere of digital media and information policy conflict with traditional notions of freedom of expression, creativity, and public access. Similarly, the notions of Internet freedom and accessibility are not compatible with the motivations of those promoting the private ownership of symbolic and material resources. Structural transformations have colonized the digital spectrum from the public and increasingly stand in opposition to public access and to the free flow of information through intellectual property law and copyright. The emergence of new geographies of power in decision-making over production and consumption defines the ways in which the circulation of cultural goods and the accumulation of profits coexist and concur.

The future of the freedom and substance of culture depends on the choices we make today. Transformative culture and investigative media require an active protection of and responsibility for the materiality of communicative and cultural expression and its constitutive elements. Communication and cultural policies play an important role in regularizing changes in the regime of accumulation that consists of the processes of production and consumption of cultural goods.

NOTES

- 1 Also see the shock doctrine of Naomi Klein on the global liberalization-cum-privatization "project."
- 2 At a national level, media and communication industries have helped construct and have been shaped by the reorganization of symbolic and technological markets. Media and culture products address localized cultures and operate within reformed, largely regulatory frameworks. Media production is therefore still shaped by the dynamics and regulatory frameworks of local or national markets.
- 3 The phrase *information society* (IS) came to include all aspects of media and communication technologies in everyday social, business, cultural, and political life. Some main aspects of IS policy concern the development of infrastructure, access to communication technologies, and skills.

Media Production and Information Policy

Growth Through Replication

Patrick Burkart and Lucas Logan

ABSTRACT

This chapter uses a stakeholder analysis to examine the legal regime governing intellectual property rights in cyberspace and those who try to shape current policies. Celebrating what they call “the Celestial Jukebox,” information policymakers in the European Union (EU) have adopted copyright maximalist standards, which follow a model dictated by Hollywood for the United States. This chapter explores the legal initiatives and mechanisms required for this transformation, the political resistance and opposition to these reforms, and the changing relationships between media producers and consumers that the reforms seek to legitimate.

In the United States, a legal “change of state” (Braman, 2007) from industrial to informational occurred in the north at the end of the twentieth century, as the digitization of telecommunications networks was completed and the Internet subsumed other forms of communication. Five media conglomerates and a handful of powerful software and telecommunications companies demanded the legal guarantees for this structural transformation in the early 1990s, and the legislative work was completed around 1998. The European “change of state” is still occurring, and so it is instructive to observe – and somewhat surprising to discover – that *most* important aspects of the restructuring resemble the US model.

Basic conflicts among private interests pervade the legal reforms that have defined the products and services of our information age. Struggles to influence information policy disclose the structures of the information society (Braman, 2007). Our “informational” social systems – especially the media and telecommunication companies, consumer goods industries, standards-setting bodies, financial systems, and legal systems – have reworked the power relationships of consumer societies from their industrial-era formats. We analyze the EU information policy reforms in order to discern sites of social struggle and as a way to track the reconfiguration of media production and consumption. Although conspicuous consumption and domestic markets for retail flourish globally, the US provides a legal template for the replication of consumer society, an ideology of consumption, and organizational repertoires for franchising global brands. We explore some economic and political implications of the adoption of this template by European countries – which, facing large trade deficits once the US is in the media and communication markets, are “harmonizing” their national information policies to conform to EU and World Trade Organization (WTO) standards. These standards are set largely on the model of the US–Digital Millennium Copyright Act of 1998, even though in certain cases the replicas exceed their model’s specifications.

In a white paper for *Wired* magazine, Pamela Samuelson (1996) described the excessive advantages sought by “copyright maximalists” when the deregulatory framework for telecommunications and digital media production was implemented through the US Telecommunications Act of 1996. The political agenda was even more explicit then than it has become today. It included the following points:

- 1 Give copyright owners control over every use of copyrighted works in digital form by interpreting existing law as being violated whenever users make even temporary reproductions of works in the random access memory of their computers.
- 2 Give copyright owners control over every transmission of works in digital form by amending the copyright statute so that digital transmissions will be regarded as distributions of copies to the public.
- 3 Eliminate fair-use rights whenever a use might be licensed.
- 4 Deprive the public of the “first-sale” rights, which it has long enjoyed in the print world (these are the rights that permit you to redistribute your own copy of a work after the publisher’s first sale of it to you).
- 5 Attach copyright management information to digital copies of a work, ensuring that publishers can track every use made of digital copies and trace where each copy resides on the network and what is being done with it at any time.
- 6 Protect every digital copy of every work technologically (by encryption, for example) and make illegal any attempt to circumvent that protection.
- 7 Force online service providers to become copyright police, charged with implementing pay-per-use rules. (These providers will be responsible not only for cutting off service to scofflaws, but also for reporting copyright crime to the criminal-justice authorities.)
- 8 Teach the new copyright rules of the road to children throughout their years at school.

We argue that the information policies to be adopted in the EU reiterate the “maximalist” standard for copyright, but not without opposition. EU governments assigned their information policy legislation and research to the Information Society Commission. In its search for a common regulatory framework for electronic communications and in its work toward a single market in creative content online (EC, 2010c), the Commission has confronted a counterdiscourse opposed to copyright maximalism and an overly expansive patent-protection policy. The counter discourse has become a “pirate” political agenda. Founded in 2006, the Pirate Party of Sweden has not only articulated this counterdiscourse for the first time; it has also given rise to the Pirate Parties International (PPI) social movement throughout Europe. This chapter examines the negotiations over maximalist copyright policy in the EU and the ways in which the Pirate Party has influenced the debates.

Methodologically, we adopt the general approaches used in the critical study of the international political economy of communication in order to identify more basic conflicts than those that appear in legal proceedings, legislative hearings, and journalistic commentary on policymaking. This path, informed principally by Dan Schiller (2003), Vincent Mosco (2009), and Sandra Braman (2007), considers the processes of media market-making and commodification as underlying the interest-group dynamics that drive political processes of reform. In our analyses of completed or pending reforms we utilize a stakeholder analysis, which allows us to conceptually map economic and political interests to identifiable groups and to conflicts and alliances between them.

To do this, we first present the basic rationale of an information policy – by which we mean the legal regime governing intellectual property rights in cyberspace, telecommunications, and electronic commerce. Information policy in the EU is torn between the need to promote European production in media and communication sectors and the need to support the nondiscrimination principles of the WTO. Then we propose that the failure to balance intellectual property rights (IPRs) with economic, cultural, and social needs for balance and equity in the US is being replicated in the new information policies of the EU. These include the failure to protect private communication online, the failure to preserve an intellectual commons comprised partly by fair use and by the public domain, and the failure to protect innovative technologies as forms of free speech. We conclude by presenting the significance of political opposition to the new information regulations, including the opposition of the International Pirate Party – a social movement organized against copyright maximalism and online surveillance. These protest movements visibly disclose the ideological basis of the new legal protections for media production, which otherwise are mystified and obscured by bureaucracy.

We conceptualize these structural transformations by considering them as part of the continuing deployment of the Celestial Jukebox in new markets (Burkart & McCourt, 2006). The Celestial Jukebox is the set of technologies for production and distribution of commercial media that adhere to the copyright maximalist standards. The promotion of the “pay-per” model for digital production and distribution in Europe is not predicated on the consent of artists, fans, private citizens, workers,

students, or even media industry functionaries. Its information policy discloses some ways by which “the *regulation* of social relations assumes a *legal character*” (Pashukanis, 1989, p. 79). In other words, information policy dictates only the apparent basis for the structures and processes of communication (Braman, 2007, pp. 1, 19–20; Mosco, 2009, p. 19). The social conflicts spilling out from the reform process demonstrate observably the political resistance and opposition to regime change, as well as the changing relationships between media producers and consumers that the reforms seek to legitimate.

Ideological Aspects of Information Policy

Information age policymakers tend to emphasize the aspect of information as a commodity and to minimize other aspects (Braman, 2007, p. 13), including its “public goods” characteristics.¹ Promoting the noncommercial value of information production and of the consumption of information has been left largely to protest groups. The most powerful stakeholders in the information society are part of an elite sector of transnational and multinational corporations with close ties to the state (Mosco, 2009). These stakeholders tend to lobby, successfully, for policies that are beneficial to specific and immediate economic interests (Braman, 2007, p. 23), and they express the unflagging impetus to commodify culture.

Information policy stakeholders are many, but among the most powerful are the corporations that represent major movie studios and music labels, large technology and software companies, and pharmaceutical companies (Love, 2009). For example, the International Intellectual Property Alliance (IIPA) is comprised of the Entertainment Software Association (ESA), the Motion Picture Association of America (MPAA), the Business Software Alliance (BSA), and the Recording Industry Association of America (RIAA), and it lobbies the United States Trade Representative (USTR) on Special 301 concerns and watch-lists (USTR, 2010; see below). Since these corporate institutions have the greatest influence in the debate over information policy, they are able to promote their specific economic interests and tend to do so at the expense of society’s other stakeholders (Braman, 2007, p. 24). Long-term control of information policy gives corporations considerable power to regulate how information technologies are allowed to evolve (*ibid.*, p. 19). This arrangement can have negative consequences for innovation and competition. The ability to control the terms of the debate over information policy is perhaps even more problematic, especially when incumbent interests can demand and win control over the creation and use of information (Benkler, 2006; Braman, 2007).

Although the “public goods” characteristics of digital information make it inherently difficult to commodify information, the legal system functions for this purpose. Creating markets for information depends in large part upon establishing restrictive policies that can diminish individual agency, for example by criminalizing peer-to-

peer file sharing. Overly restrictive sharing policies are state-sanctioned methods for creating information scarcity (Mosco, 2009, p. 191) and for making new markets for digital products where none previously existed. For example, the business logic of copy-protecting music, software, e-books, streaming video, and video games is to minimize the number of non-payers who consume these goods. As there is no market remedy for the unpaid file sharing of commercial media, media owners have appealed to the world's legal systems to create harms claims in every instance of illicit sharing. Free-trade agreements that favor industrial claims to intellectual property over social and cultural claims to a public sphere are other examples of the use of the law for rearranging social relations so as to benefit investors and their commercial interests, for instance IPRs (*ibid.*, p. 182). Very often the protection of these interests comes at the expense of noncommercial interests. Indeed, information policy has grown so lopsided in favor of intellectual-property-rights owners that, for example, ordinary Internet users are often considered guilty of infringement until proven innocent and their online interactions are policed by corporations or private institutions (Braman, 2007, pp. 179–180). Such was the case of Jammie Thomas, a Native American mother of four who was sent a cease and desist order and settlement offer from the RIAA in 2005, for allegedly sharing 24 songs through the Kazaa file-sharing network. Thomas appealed to a US District Court, where she pleaded not guilty and claimed to have had neither Kazaa nor the purported music files on her computer's hard drive. The first jury to have ever tried a file-sharing copyright infringement lawsuit found, on the basis of observations made by the RIAA's cyber-surveillance system called MediaSentry, that Thomas had "made available" the files, even though she had not distributed them. On an appeal and retrial Thomas was found guilty of willful copyright infringement, and she was ordered to pay the plaintiffs \$1.92 million – or \$80,000 per song. The judge in the case called these damages "monstrous and shocking."²

The criminalization of online IPR infringement expands through international law and trade agreements (FIPR, 2005). Criminalization is supported by transnational and multinational media corporations and by some software corporations (*ibid.*, §1, para. 4). These corporations claim that maximally strict IPR enforcement is needed to offset the economic problems caused by counterfeiting and infringement (European Commission Directorate-General for Trade, 2010, para. 2). In the next section, we examine the structural role of information policy on media production and international trade.

Information Policy and the Balance of Trade

The dominance of state-owned enterprises in both East and West Europe lasted through the 1980s. After the breakup of the USSR and the so-called "velvet revolutions" in the Eastern Bloc countries, television, radio, and telephone company

privatizations accompanied structural reforms on Western, market-based models, as subsidies were dropped for film and other national media. By the 1990s, Western European countries were privatizing their telcos, deregulating their state-owned media and telecommunications firms, and developing “dual” public and private markets for broadcasters and cablecasters. Late privatizations of state-owned media firms, multiple language markets, political battles to protect national audiovisual markets from foreign imports (principally, US film and television), and public subsidies are factors keeping European markets fragmented, but also partially shielded from Hollywood imports. The centralizing initiatives of the European common market and the European Union seek strategies for mitigating and reversing the fragmentation. Facing continuing trade deficits in media and communications with the US of six to eight billion dollars annually (EC, 2005a; EC, 2010b), the 27 principal countries of the EU have responded with new information policies, principally in intellectual property rights law.³ Trade liberalization in all “electronic communications” and markets for telecommunications services was designed largely to promote investment in the communication sector. “The new regulatory framework adopted at EU level at the beginning of 2002 lays down clear and stable rules that should create certainty for investors” seeking access to the common market (EC, 2005a).

The US-based firms pressed the EC for, and largely won, standardized digital copy protections, copyright terms, and criminal-court remedies for broader categories of infringers abroad.⁴ The history of global IPR reforms to date discloses a replication of the US model for enhanced property rights and penalties through US foreign-policy objectives. Hadl and Hintz (2009) describe the reformatting of international legal and industrial systems to conform to the US and the WTO model of copyright as something akin to a “Washington Consensus” for intellectual property, especially copyright. Whereas the Washington Consensus in the 1980s and 1990s specified what fiscal reforms, structural reforms, free-trade measures, and austerity measures would be prerequisites for countries with privileged access to US consumers and markets for credit, the US copyright lobby can now be said to dictate the terms of copyright, trademark, and patent-law reforms from petitioning countries.

The propagation of US-style copyright regimes has become an explicit foreign-policy goal of the US and exerts influence through ongoing pressure from trade groups representing the content industries – principally the RIAA (Recording Artists Industry Association), the MPAA (Motion Picture Association of America), and the Business Software Alliance; through the operation of the US Trade Representative’s office; and through the generation of regular “Special 301” reviews and official black-lists of US trading partners.⁵ Most recently, “Internet piracy specifically [. . .] was labeled a ‘significant concern’ in Brazil, Canada, China, India, Italy, Russia, Spain and Ukraine” in 2010 (USTR, 2010).

The global IP standardization project we describe takes key pieces from the US–Digital Millennium Copyright Act (DMCA) (non-circumvention), from the Sonny Bono Copyright Term Extension Act (copyright term extension), and from the joint policy initiatives of the US and EU in the Anti-Counterfeiting Trade Agreement

(ACTA) (three-strikes provisions).⁶ These three policymaking zones constitute the legal umbrella for the “copyright maximalist” agenda that Samuelson describes (1996). The DMCA provides criminal penalties for the circumvention of copy protections (Herman & Gandy, 2006); the copyright-term extensions extend the copyrights for protected works by three generations; and the ACTA would standardize a system whereby purported infringers could be banned by law from ever accessing the Internet again in their lifetime. The project is still unfinished, as of this writing; the ACTA’s final implementation has been delayed by protests in Europe and Canada over the unbalanced force it calls to bear on purported copyright infringers and over its nontransparent and nonparticipatory procedures, which have been negotiated in secret, by an executive branch.⁷ Using the asymmetrical power advantage enjoyed by US exporters and importers, the copyright lobby (principally the RIAA, the MPAA, and the BSA) tie any friendly trade and foreign relations with the US to the precondition that foreign countries adopt the US model of copyright reform and demonstrate a willingness to enforce the new provisions.

Creating an information policy that protects the interests of the key producers and distributors of the digital economy is an important basis for projecting what Sassen (1999) calls “network power” and what J. S. Nye (2004) calls symbolic “soft power” globally. “Soft power” means the power to influence foreign governments through noncoercive, cultural and political means, and it can also be said to include influence in world markets. The Telecommunications Act of 1996 lifted the media cross-ownership provisions that had separated content and carriage companies and encouraged the integrated telecoms to join the IPR owners and to unite around the DMCA. The DMCA, beside creating millions of new liability claims for the entertainment industry and the prospect of a revenue model based on collecting penalties from file-sharers, also implemented the World Intellectual Property Organization (WIPO) Copyright and Performances and the Phonograms Treaties Implementation Act. This Act harmonized US copyright law with the law of countries that signed previous copyright conventions and treaties. The 1998 Copyright Term Extension Act further extended the terms of most copyrighted works beyond the natural life span of humans.⁸ The Prioritizing Resources and Organization for Intellectual Property Act (2008; the PRO-IP Act) heightened penalties on copyright and trademark infringements and created the Office of the United States Intellectual Property Enforcement Representative (USIPER) in the executive branch. These contributed to existing frameworks for promoting e-commerce⁹ and “cybernetic commodification” (Mosco, 1996, 2009) – including sales-tax exemptions for online shopping, encryption standards for secure electronic payments, and penalties for online fraud.

Through these reforms of US information policy the legal system came to protect the interests of the largest incumbent producers of intangible goods and services – especially the media, telecoms, and software companies. It also strengthened their hand vis-à-vis other stakeholders. In return, the integrated conglomerates have devised the Celestial Jukebox model, wherein consumers must pay on-demand rates to licensed distributors for exclusive or near-exclusive access to digital media (Lehman,

1995, pp. 221–222). Its basis in the legal system is the existing legal realist tradition in the US, which defines information operationally, as a resource similar to physical resources that can be owned and stolen (Braman, 2007, p. 12). Information, by this definition, becomes part of an information environment, and the allocation of information resources to state agents, individuals, and the private sector becomes a primary source of struggle over power in the information society (ibid., pp. 12–13).

The Replication of the Celestial Jukebox

The replication of the legal structure that enabled the Celestial Jukebox to emerge in the US is occurring in the EU. Apart from exercising strong market power (owing to vertical integration of ownership and to exclusivity arrangements), the firms and other institutions operating the Celestial Jukebox also exert “network power,” which works through access controls and proprietary standards for hardware, software, and networking in markets for information and telecommunications services. When network power accrues disproportionately to media exporters with strong influence over US trade policy, it might be argued that the replication of the Celestial Jukebox in Europe stands to exert “soft power” there as well. Over the course of two strong up-and-down business cycles, Hollywood conglomerates have mostly incorporated the technology and business practices of the new media and their legal, technical, and financial support network, and they have mastered the contrivances needed for producing information scarcity. Media “convergence” has occurred both technologically and in the ownership and organization of conglomerates.

Whereas marketing and public relations discourse promote both convergence and new markets for the content industries as consumer bonanzas, the production and maintenance of conditions of information scarcity has become the critical function of integrated mass media and new media conglomerates. As Daniel Schiller relates:

Information scarcity, rather than information abundance, in many cases best serves the process of profit making. But information scarcity is not a natural condition; it has to be worked at, indeed, *contrived*. And so it is. Restricting access to information requires deployment of legal, technological, and other coercions. (2003, p. 150)

The Celestial Jukebox, being the set of contrivances that tested the newly converged media business models, has been poised for export from the US. It is becoming available now to European countries whose legal systems previously resisted it, and this is happening through regulated markets for foreign media, consumer privacy protections, and unharmonized information policy.

As previously mentioned, the Celestial Jukebox’s replication has required legal initiatives and mechanisms to transform Europe’s legal system on the model dictated by Hollywood for the US. Specifically, the adoption and implementation of the

European Union's Directive for the Enforcement of Intellectual Property Laws (IPRED) and of the ACTA have been US-based initiatives designed to propagate US-style information policy to the major trading partners of the largest media, telecoms, and financial companies. The IPRED and the ACTA are multilateral agreements that harmonize the legal systems of EU member states and provide legal cover for the exportation of the pay-per-use business models of the Celestial Jukebox.

Opponents of harsher IPR policies – including civil libertarian groups, information policy reform organizations, and many workers in the software and telecommunications industry – argue that criminalization stifles online innovations and the communicative freedom needed to create new intellectual property (FIPR, 2005; McLeod, 2005; Doctorow, 2010; EFF, 2010b). Opponents also argue that forcing Internet Service Providers (ISPs) to track customers and report possible infringement to IPR holders or to the state, a common practice in enforcing criminalization, creates a chilling effect for users and forces ISPs to act as police (FIPR, 2005, §2, paras. 6–10). The minimum specifications and technical requirements for an “Alternative Jukebox,” which prioritizes privacy, accessibility, and free speech rights for online culture sharing, have been elaborated elsewhere (Burkart, 2010; Burkart & McCourt, 2006).

These criticisms of aggressive, hegemonic moves to control intellectual property have emerged from an information commons movement (Braman, 2007, p. 183). This movement is made up of an array of individuals and organizations whose views range from fundamentally changing intellectual property laws through abolishing them to incrementally changing them by easing restrictions to access (*ibid.*). As a practical matter, intellectual commons groups, as weaker stakeholders in the information society, are more likely to succeed at enforcing incremental or partial change than fundamental change (Majchrzak, 1984, p. 71). For instance, a non-governmental, multilateral organization called the Foundation for a Free Information Infrastructure (FFII), which is supported by open-source software developers, by independent music labels, by consumer rights groups, and by cyberliberties activists, has been active in challenging the industry-backed IPRED and, with help from other civil society and business groups, it has managed to strip the legislation of harsh, over-reaching new patent laws (EFF, 2010b). Information commons groups play a central role in the formation of intellectual property policy by mobilizing power and resources tactically.

Alternative Tentacles: The Rollout of European Access Controls

The following sections analyze the key stakeholders of IPRED, IPRED 2, and ACTA. These three initiatives galvanized support among elite members of the European Parliament and also coalesced a weaker, much more diverse and diffuse set of opponents in civil society and in the private sector. The enumeration of competing stakeholder groups supports our broader claim that social conflicts drive the reform

process; it will also facilitate a more thorough analysis of the stakeholder structure in future research.

IPRED and IPRED 2

The European Union initially adopted IPRED in 2004 (EC, 2004). IPRED harmonized counterfeiting and copyright penalties and remedies among EU Member States in order to reduce uncertainty and risk for IPR holders within the European Internal Market (*Official Journal of the European Union*, 2004). IPRED gave IPR owners the ability to order ISPs to turn in the names of users suspected of heavy trafficking (Hinze, 2004). The directive also enables search and seizure orders, injunctions, and the freezing bank accounts linked to those *accused* of infringing intellectual property. The directive assumes guilt until innocence is proven, since the mere charge of infringement triggers the IPRED provisions. Opponents of IPRED argue that the directive harms consumer privacy and places unfair burdens on ISPs and on small businesses that are forced by the state to police Internet usage. Despite the increased enforcement capabilities that IPRED gave to rights holders, small-scale copyright and patent infringement is still a matter of civil litigation (FIPR, 2005).

Under IPRED 2, however, copyright and patent infringement became a criminal activity, along with inciting or abetting infringement (EC, 2006). While IPRED 2 was being debated by the European Parliament in 2006, civil liberties groups and several European member states objected to provisions that overstep the abilities of the European Commission to regulate member states (FFII, 2006). Critics also objected to the IPRED 2's failure to distinguish between different magnitudes of copyright and patent infringement (EC, 2006; FFII, 2006). For instance, it links counterfeiting and piracy with organized crime and the drug trade, but it never clarifies a distinction between an online infringer violating copyright for home use and the types of counterfeiters who engage in organized crime. The proposal brands all infringers as criminal, without appropriate regard for the scale of infringement.

According to an analysis made by the Foundation for Information Policy Research (FIPR; see FIPR, 2005), industrial stakeholders were divided about the passing of IPRED and IPRED 2. The music industry – which has close ties to the US government (Kravets, 2009) – large consumer-products companies, pharmaceutical companies, and auto makers favored the legislation (FIPR, 2005). Additionally, the European Commission supported the passage of IPRED, giving supportive stakeholders an edge in asserting the specifics of the directive (FIPR, 2005). Opposition to IPRED included ISPs, auto-parts makers, makers of generic drugs, and civil society groups ranging from open-software groups to librarians (FIPR, 2005). The opposition groups did have the resources to make some significant revisions to IPRED, but they were not able to create enough effective mobilization to overturn the directive altogether (EFF, 2010b).

The IPRED's revisions focused on patent law, where non-governmental organizations (NGOs) like the FFII were able to convince policymakers that strict patent laws are harmful to innovation and could put the European Union further behind the US in terms of FIPR technological innovation (EFF 2010b; FIPR, 2005). Opposition groups focused on the harm that patent restrictions could do to the open-source community and pointed to potential economic damage (FFII, 2006). The FFII noted, for instance, that Microsoft lobbied for more severe software patent restrictions in the EU but lobbied for the opposite in the US, which suggested that Microsoft wanted to create an unfair competitive edge over its European rivals (FIPR, 2005, para. 3). The organizations opposed to patent revisions also benefited from strong support from open-source software groups and from Sun Microsystems (FIPR, 2005, para. 3).

That the opposition groups for patent provisions were more successful than the opposition groups for copyright provisions is a statement to the former's superior lobbying and messaging to members of the European Parliament. The claims that harsh patent laws could damper economic growth and harm technological innovation in the EU won out over the claims that stricter copyright provisions would harm European society. Specifically, the FIPR's response to IPRED 2 argues that new patent restrictions could raise the price of auto parts; eliminate the generic drug industry; hurt small business; force the European gaming industry to pay royalties to foreign companies like Microsoft and Sony; and discourage the use of open-source operating systems created by Europeans (FIPR, 2005). These arguments are firmly rooted in economic data, and information industries such as software are portrayed as firms whose products risk devaluation.

As for arguments against harsher copyright infringement, FIPR points to chilling effects on librarians; the criminalization of universities for aiding and abetting infringement when academics accidentally share work online that is copyrighted in a journal, or when students share music files; the criminalization of security research; the criminalization of street music; and the undermining of privacy through increased online surveillance (FIPR, 2005). These lines of argument portray criminalization of copyright infringement as something that will damage information as a shared resource, as opposed to information as a privately owned commodity. Proponents of criminalizing infringement spoke purely in terms of the economic dangers posed by online copyright infringement, and they were successful at pressing their agenda on decision-makers (EC, 2006).

Overall, the corporations supporting IPRED had more influence on rulemaking bodies than their opponents had, but the winner of particular policy debates was the side that best articulated the trade and investment benefits accruing to "Europe." The social and cultural implications of policy are classified as secondary, and the primary obstacle in the way of passing IPRED 2 consists largely in legal questions over the power of the European Commission, and not in fears of the harm that the directive could cause in the EU (EFF, 2010b).

ACTA

ACTA was initially proposed by USTR to curb global counterfeiting and piracy (USTR, 2010). Governments currently represented in the negotiations include those of Canada, the EU, the United States, Japan, South Korea, Mexico, Morocco, New Zealand, and Singapore (EC, 2010a). The end goal is to create a much larger global coalition to engage in the trade agreement, as proponents of ACTA argue that the WIPO and the Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS) do not police counterfeiting and piracy sufficiently. The intention behind certain aspects of ACTA is similar to the intention detectable behind IPRED 2: to strengthen copyright, patent, and trademark laws through criminalization measures and to give IPR holders more control over the work at the expense of consumer controls over the work.

ACTA is still in the negotiation phase and may not survive a sustained debate, but the manner in which this trade agreement was initially negotiated highlights the way in which transnational corporations and governments work together to create trade agreements that support specific economic interests at the expense of the greater culture and society (Geist, 2010a; Mosco, 2009). Civil liberties organizations as well as digital-rights groups and activists have intensely protested against ACTA's secret negotiations and provisions for IPR holders (Announcement, 2008). Opponents of ACTA argue that the public and the civil society groups are locked out of these negotiations (Hinze, 2004). Indeed, initial requests for access to ACTA were blocked when US President Barack Obama claimed state-secrets privilege over the negotiations, though pressure from the European Parliament did eventually spur the public release of an early ACTA draft (European Parliament, 2009; Love, 2009). The primary concern of opponents is the provision in ACTA for a graduated-response or three-strikes law, which would force ISPs to ban the Internet use of those accused of infringing intellectual property (FFII, 2010).

The "three-strikes" plan specifies a graduated-response strategy for the purported infringers – a strategy whereby ISPs, after being informed of a potential copyright violation by a third-party copyright holder, can send warning letters to users accused of copyright infringement (Ryan & Heintz, 2010, p. 3). After two of these letters, if the alleged infringer is accused again, he or she is in some capacity banned from using the Internet (*ibid.*). The need for, and the extent of, judicial review is a primary part of the debate over three-strikes laws (FFII, 2010). In its harshest form, a three-strikes law could ban someone from using the Internet over mere accusations of copyright infringement with no judicial oversight – which, again, pushes the legal supposition that individuals sharing information online are guilty until proven innocent of theft (Braman, 2007, pp. 179–180; FFII, 2010).

The entertainment industry disposes of the concerns of civil liberties groups and activists by claiming that strong intellectual property laws are needed in order to protect profits and artists in the global information economy. The entertainment

industry is a powerful stakeholder in the ACTA negotiations thus far, as is evidenced by a list of those consulted by the USTR. The list was given to Knowledge Ecology International (KEI) in response to a Freedom of Information Act request and it included representatives of Sony Pictures, Time Warner, the Motion Picture Association of America (MPAA) and the Recording Industry Association of America (RIAA) (Love, 2009). Additionally, organizations like the International Intellectual Property Alliance, which are heavily invested in stronger intellectual property laws, were consulted (*ibid.*). As direct consultants to the USTR in the ACTA negotiations, these key stakeholders have a position of greater power to negotiate from than the civil society groups that oppose ACTA have (Majchrzak, 1984). The list given to KEI only included one representative organization that supports intellectual commons ideal: Public Knowledge (Love, 2009).

The most powerful opponents of ACTA may not be civil society groups. India, China, and other developing nations have voiced their opposition to the secret ACTA negotiations, claiming that the provisions violate TRIPS and impose unfair standards on the developing world, for instance by forcing those nations to devote to protecting intellectual property resources that would be better spent on infrastructure and public health (Geist, 2010b). Such objections illustrate the conflict between global capitalism and cultural imperialism (the latter being often imputed to the former) – a conflict in which transnational corporations and governments demand the protection of commercial media over developmental priorities (Mosco, 2009, p. 73). The coalition of nations and corporations invested in ACTA has no power or leverage to order China or India to comply with this trade agreement (Geist, 2010b). These countries may prove to be less compliant negotiators than the European countries, in part because they can better afford to exercise their sovereignty due to their large internal markets.

Meanwhile, laws in France and in the United Kingdom have laid the groundwork for graduated-response laws such as those encouraged in recent drafts of ACTA. The provisions of the French HADOPI, like those of the British Digital Economy Act, exceed the specifications of the US template, and thereby they divulge new forms of copyright maximalism. By Samuelson's (1996) measures, HADOPI and the British Digital Economy Act of 2010 seem to be, if anything, examples of copyright super-maximalism in their call for additional legal protections for corporations, and even for higher legal penalties for alleged infringers.

Case Studies: HADOPI and the Digital Economy Act of 2010

HADOPI, France

The law (*loi*) or bill known as *Création et Internet* is France's answer to a graduated-response system designed to deal with intellectual property infringement (Ryan &

Heinl, 2010). It is commonly referred to as the HADOPI law, a formula incorporating the acronym of the legislative body created by this law: the Higher Authority for the Distribution of Works and for the Protection of Copyright on the Internet (*Haute autorité pour la diffusion des œuvres et la protection des droits sur Internet*). The law represents the culmination of talks carried by the entertainment industry and ISPs with the French government to create new protections for intellectual property (Senate of France, 2009). The new law gives HADOPI the authority to oversee complaints from copyright holders over infringement. HADOPI is given the authority to suspend individuals' use of the Internet by up to one year for copyright infringement, and it can enforce software-blocking measures at institutions where infringement is found to be committed (*ibid.*). Initially HADOPI was to be given the authority to punish infringers on its own; but, due to legal complications, the law was rewritten so as to include judicial review (Ryan & Heinl, 2010).

Under the current draft, HADOPI turns in infringers to the courts after three warnings, and, in addition to cutting off their Internet access, it may fine them up to €300,000 and make them face up to two years in prison (*ibid.*). Currently, a private investigative company has been hired by the copyright industry to track down infringers in France and turn them in to HADOPI. This arrangement essentially allows private industry in France to police alleged copyright infringers and then to have them punished through the courts, a situation that showcases the corporate–governmental ties that govern information policy in an information economy (Braman, 2007).

The influence of powerful corporate stakeholders on French law affects democratic institutions also beyond the legal system. The HADOPI bill contains specific statutes that regulate the societal and cultural direction of the information society in France by modifying the education system (Senate of France, 2009). Article 15 of the law amends the education code for students in mandatory grade school and in college music and art classes, asking for it to be “informed of the dangers of downloading and of illicitly making available works or objects protected by a right of authorship or a related right for artistic creation” (*ibid.*). Additionally, the law mandates that secondary-education classes dealing with informatics and Internet certification are taught by teachers with specialized backgrounds in intellectual property law (*ibid.*, Article 16). These classes are then to be used to inform students of the dangers of illicit downloading and counterfeiting and of the ownership rights of authors and creators.¹⁰ The modifications made here affect, potentially, the social upbringing of the French youth as a whole by giving it an understanding of intellectual property that is firmly in line with the hegemonic capitalist views of the most powerful stakeholders in the HADOPI debates. Changes to the educational system of France, no matter how slight, are clear examples of the constitutive power of information policy (Braman, 2007, p. 19)

Digital Economy Act of 2010, UK

The United Kingdom's Digital Economy Act does not fully introduce a three-strikes system, but it does establish a foundation for one by giving the Office of

Communications (Ofcom), UK's communications regulator, the ability to instate such a rule eventually, if the measures that the Act introduces are ineffective (Department for Business Innovation and Skills, 2010). The current version of the Act requires ISPs to track suspected copyright infringers and to keep a record of how many times infringement has been committed. Copyright holders can at any time apply for a court order to get the names and addresses of these alleged infringers and to take legal action. Then copyright holders would send a cease and desist letter to the alleged infringer (Ryan & Heintz, 2010). Should this measure fail, copyright holders can take the accused infringers to court, for criminal litigation. The ISPs in the UK have one year from the enactment of the law (enacted in April, 2010) to devise methods for tracking copyright infringement. Additionally, ISPs are legally obligated to police users by slowing down connection speeds, by banning particular content from individuals outright, and by suspending service or in some other way limiting Internet access if they suspect copyright infringement (Digital Economy Act, 2010, §9). The Act was fiercely debated in the UK, where civil liberties activists claimed that the negotiations were unfairly influenced by the British entertainment industry and by Hollywood studios at the expense of numerous civil liberties groups and tens of thousands of individuals who protested the bill ("Call for 'Fuller' Debate, 2010; Doctorow, 2010). The success of corporate-governmental coalitions in promoting the new Washington Consensus highlights Mosco's (2009, p. 180) claims that the narrow economic interests of a select class of corporations control information policy.

Corporate control of the debate over information-age media policy is evident in the exclusion of the public and of information commons stakeholders in the terms of the ACTA debate (Love, 2009); in the proposal for IPRED 2, where copyright infringers of all types are treated as organized criminals and drug-trade kingpins (EC, 2006, p. 1); and in the HADOPI law, according to which the French government educates young people in the virtues of the policy of blocking Internet access for life (Senate of France, 2009, Articles 15 and 16). These policies create and try to impose an ideal of citizens as consumers who must be restricted in their access to information, but who must also use information policy as a constitutive force in order to alter social, economic, and cultural norms through education programs and through the labeling of sharing as criminal (Braman, 2007). Fortunately opposition has found some success – for instance the shelving of patent-law reforms in IPRED and the release of an early ACTA draft to the public (EC, 2010a; EFF, 2007). The arguments of opposition groups are also enhanced by the fact that these policies are, from the point of view of a stakeholder analysis, largely inefficient on an economic scale (Majchrzak, 1984).

Developing Alternative Models for Information Policy

Laws that limit the ability of noncorporate, non-state actors to engage in information sharing and cultural production in electronic networks also extinguish many of the potential welfare benefits of the networked information economy, which depends

upon self-publication, collaboration, and a continual repurposing of cultural objects (Benkler, 2006, pp. 3–4). Benkler and Braman present the historical paradox that conflicts between the interests of industrial-age enterprises were solved and the parties were politically “reconciled” through laws that rapidly became either ineffective or draconian when applied to the private individuals (Braman, 2007 p. 63). As young people in particular have become technologically enabled “prosumers” or culturally productive consumers, the restrictions placed on their ability to share, remix, and play with copyrighted digital cultural objects has increased dramatically. While articulated clearly in the popular press (Doctorow, 2010; Klein, 2010), in media scholarship (Burkart 2010; Rodriguez, Kidd, & Stein, 2009), and in activism (PPI, 2012), the views of those calling for a networked, nonindustrial information economy have not yet found formal representation in any legal system. Leaving aside the implications for civil liberties and for the open society, failed information policy in an information society can also damage the structures and processes of communication and stifle the ability for future economic growth (Benkler, 2006, p. 135).

Successful lobbying for information policy reform must take practical economic considerations into account. Groups lobbying against the IPRED patent-law reforms had to consider that the software and software-based service industry in the EU generates approximately \$240 billion per year in revenue (Pierre Audoin Consultants = PAC, 2009, p. 9). Likewise, proponents of progressive copyright reform have competed with representatives of the International Federation of the Phonographic Industry (IFPI) who claimed that piracy directly cost the European music industry a loss of \$3.4 billion, or 36% of its total revenue (IFPI, 2010, p. 5). Benkler argues that, more than being able just to contribute to a global information economy, sharing and creating content is the only way for such an economy to succeed. The challenge, for progressive reformers, is not to convince policymakers to reject the notion of information as a commodity, but to emphasize the intrinsic benefits of information as a *shared* resource (Benkler, 2006). For instance, free software may be said to strengthen small business; and the chilling effects of the criminalization of copyright infringement may be said to endanger directly Europe’s \$25 billion content-creation sector (PAC, 2009, p. 117) by stifling innovation (FIPR, 2005, §1, para. 4).

While economic considerations and arguments are vital in changing information policy, individuals, NGOs, and various activist groups have built networks in defense of the right to be allowed in the debate over the future of the information economy. After all, there is no way to join the debate without a seat at the table. The networking that led to the rise of public awareness of the new ACTA commitments is a blueprint for how the intellectual commons movement should coordinate itself in policy debates (European Parliament, 2009). Political conflict over European information policy, emerging as it did from popular protest groups advocating stronger cyberliberties protections (for privacy, access, and free speech), has the potential to spill over into broader policy arenas than the media; these include software, “nonlinear” and video-on-demand (VOD) digital cable, and Internet Protocol television (IPTV). Networked activism promoting a new policy demands accountability from

the information policies that are already set in favor of the economic interests of Hollywood content industries and other incumbent rights holders (Braman, 2007).

The election of two Pirate Party candidates from Sweden to the European Parliament has demonstrated the concept of networked activism in opposition to the new Washington Consensus; in particular, the work of Pirate MEP Christian Engström on the European Parliament's Committee of Legal Affairs has been instrumental in moderating the worst abuses of cyberliberties that were lurking in the draft legislation (Vandystadt, 2009). Although the political history of the Pirate Party is still young and the group itself springs from ongoing conflicts with the Pirate Bay (the Swedish search engine for file-sharing), the Pirate Party can be said to have already exerted a moderating influence over the implementation of the new Washington Consensus in Europe. MEP Engström has, for instance, disclosed the existence of an Internet Protocol observatory (an "IP observatory") for online surveillance (Masnick, 2010). Engström has also crafted the language for Amendment 138 of the EU telecoms package, which would require judicial scrutiny for any invocation of three-strikes provisions throughout the EU (Vandystadt, 2009). The Pirate Party has a variety of cultural politics espoused by young people under 30 and organized in opposition to "normal" party politics, and also a variety of "anti-political politics," to use Václav Havel's (1991) apt expression. "We are very strong among those under 30. They are the ones who understand the new world the best, and they have now signaled they don't like how the big parties deal with these issues" (Engström, quoted in Wood, 2009).

Conclusion

The international political economy of communication focuses on the ownership and control of the culture industries by the key players in the corporate world, in the public sector, and in civil society. We have used this approach to emphasize the mobilization of resources (power and money) that the private sector brings to bear on shaping information policy and to contrast the power of the private sector with the power of civil society groups, which operate in opposition and with greater difficulty, having fewer resources.

For young European adults "born digital" and for older Europeans who have learned practices of do-it-yourself media production and of culture sharing in digital formats, the foisting of a new set of prohibitions against copyright infringement, while debated as a legal matter, is something very personal and politically motivating. In the midst of ongoing economic and legal integration in the EU and EC, an environmentalism for the Internet is emerging. The oppositional politics of the Pirate Party has demonstrated that debating the online environment as a quality-of-life issue is now possible, and that information policy should be debatable and decidable through democratic processes.

What we have called the new Washington Consensus, while intending to promote the European common market, may actually conflict with existing trade policies for audiovisual media. On the one hand, in trade programs promoting “media pluralism” – such as the Media Plus Program (2001–2005), the eContent Program (2001–2004), and the ongoing Television Without Frontiers – the EU has reinforced structural advantages for vertically integrated European media companies and for strong national champions. These programs create non-tariff barriers for US media exporters, including new media content providers, and they make it harder for competitors to break into the European markets. Yet, on the other hand, by implementing copyright reforms on the US model, the European countries seem to create openings for the greater access of US-based content industries to commercial online channels.

We look at the case of Europe because, from Hollywood’s perspective, the information policy governing Europeans has lagged behind that of the US. In the process of “catching up” and interlocking with legal norms and structures shared by the US and by WTO member states, European leaders hope to become competitive with the US as media exporters, and they grow national markets for media, software, and services. The incipient tension between old and new regulatory regimes for European media, together with new, social movement-style opposition to information policy reforms, suggests that the informatization of policy has not been seamless or automatic – even as its template replicates.

NOTES

- 1 Whereas “the consumption of private goods uses up scarce resources and therefore needs to be rationed (usually by the market and by prices), [. . .] public goods do not comply with this logic. The initial cost involved in establishing a public good may be high but then the marginal costs associated with supplying an extra unit of it are next to zero” (Doyle, 2002, p. 13).
- 2 A legal archive on this case is kept at http://www.ask.com/wiki/Capitol_v._Thomas.
- 3 We acknowledge (but set aside for now) the significant contributions to consumer data protection that EU legislation has codified – including anti-spam, opt-in, and restrictions on the use of cookies. These differences from US information policy have created trade friction, and EC regulators slowed down the expansion of many firms that sell access to online content and databases. We also recognize that, while the consumer role is over-emphasized in EC regulations to the detriment of the citizen role (Gollmitzer, 2008), community media and grassroots media advocates carve out noncommercial spaces for media producers (Jiménez & Scifo, 2009).
- 4 In the US the ownership and control of the “Celestial Jukebox” – the aggregate of commercial on-demand media services – was consolidated through coercive measures that required the subordination of private and non-commercial speech and other forms of cultural sharing to markets for commercial media (Burkart & McCourt, 2003).
- 5 The “decentralization” of US trade policy moved trade policy from the exclusive control of the executive branch to corporate interest groups in the mid-1970s (“Foreign affairs,” 2009).

- 6 "In October 2007 the United States, the European Community, Switzerland and Japan simultaneously announced that they would negotiate a new intellectual property enforcement treaty, the Anti-Counterfeiting Trade Agreement (ACTA). Australia, the Republic of Korea, New Zealand, Mexico, Jordan, Morocco, Singapore, the United Arab Emirates and Canada have joined the negotiations" (EFF, 2010a).
- 7 Public debate over the ACTA has been possible solely as a result of leaks of its various drafts.
- 8 For works created by individual authors, the Act extends copyright to the life of the author, followed by 70 years. Works of corporate authors are protected for 120 years after creation or for 95 years after publication, whichever comes first.
- 9 Unsuccessful attempts to accelerate reforms have fallen short in the US Congress; these include including the the Uniform Computer Information Transactions Act (UCITA), the Piracy Deterrence and Education Act (PDEA), and the Inducing Infringement of Copyright Act (INDUCE).
- 10 The following paragraph is added to a section of the education code mandating that students receive education in technology and computers via Article 16 of the bill *Création et Internet*: "Within this framework, in particular when preparing secondary students for the certificate in informatics and Internet, they receive from teachers previously sensitized in this subject information on the risks associated with using public on line communication services, on the dangers of downloading and illicitly making available works and objects protected by a right of authorship or a related right for artistic creation, as well as the sanctions for violating the obligation defined in article L. 336-3 of the intellectual property code and the crime of counterfeiting. This information also covers the existence of legal offerings of works and objects protected by a right of authorship or a related right on public on line communication services" (La Quadrature du net, 2012).

The Slippery Slopes of “Soft Power”

Production Studies, International Relations, and the Military Industrial Media Complex

Jonathan Burston

ABSTRACT

The nexus conjoining sites within American entertainment, media, and communications industries to the US military has been called many names. This chapter deploys the phrase “military industrial media complex” (MIM-plex) to describe this burgeoning political-economic formation, and it argues that, despite existing work, larger questions on the MIM-plex remain unasked and unanswered about how studies of media production might matter to other disciplines, to the wider world, and to the field of international relations (IR) in particular. Using the Hollywood–army think tank – the Institute for Creative Technologies – as an example of how media studies and IR might communicate, this chapter also suggests that participants in such a dialogue pay careful attention to the influence of dominant masculinist discourses inside both IR and media studies. These discourses often posit “hard” working concepts against “soft” ones – an increasingly questionable practice that has often diluted both the significance of entertainment and the role of entertainment labor inside discussions of media power.

The MIM-plex, Media Studies and the Academy

Since the time it was first identified in the late 1960s, the nexus conjoining various sites within American entertainment, media, and communications industries to sites inside the US military has been called by many names. Among them are *the military industrial communications complex* (Schiller, 1969), *the military information society* (Levidow & Robins, 1989), and *the military entertainment complex* (Lenoir, 2000). In an attempt to shorten what is perhaps the most commendably comprehensive designator for an entity that, in actuality, ties together many different economic sectors – namely *the military industrial media entertainment network* or *MIME-NET* (Der Derian, 2001) – alternatives have recently been volleyed such as *the military industrial media complex* or *MIM-plex* (Burston, 2003), and, even more simply, *the Complex* (Turse, 2008). Different appellations direct readers to different precincts inside this large and amorphous social, political, economic, and martial formation while simultaneously conveying its size, its complexity, and its growing power and influence. Insofar as its power and influence were indeed works in progress, the earliest of these analyses of the MIM-plex's tentacular reach and prowess could sometimes feel, alternately, overstated or undertheorized. Herbert Schiller's pioneering (1969) study explained in detail, for the first time, the significant linkages existing between the American communications sector and both the civilian and the martial branches of Eisenhower's famously named "military industrial complex"; but the conclusions drawn in this otherwise important work suggested, perhaps in too deterministic a manner, connections between American communications' might and "successful" imperial outcomes. Levidow and Robins' (1989) farsighted analysis of the emerging "military information society" chose an appellation for that society that rendered invisible its ludic dimensions even as such dimensions figured into their own analysis. Nevertheless, these preliminary portraits provided valuable frameworks within which media scholars have been able to discern many of militarized, mediatized capitalism's future advances.

And those advances have been profuse. Today, journalists "embedded" within the armed forces of various nations have become unremarkable; and equally so have hit prime-time TV dramas glamorizing contemporary military life (in the US, *JAG* and *NCIS*) or simply militarized life (Canada's *The Border* and *Flashpoint*). The Pentagon's media office, widely regarded as the best public relations (PR) house inside the US government, provides aircraft carriers to blockbuster film projects it deems suitably on message (Robb, 2004; Boggs & Pollard, 2007). Movie studios collaborate with the military in formulating battle simulation exercises, so that the Pentagon may benefit from Hollywood's superior ability "to understand formulas and how to play with them, to think outside the box, against the grain and backwards from completion," thus gaining "a much deeper and more subtle grasp" of the new, volatile possibilities inherent in global asymmetrical warfare (Stockwell & Muir, 2003). Video games glamorizing war eclipse Hollywood blockbusters in their sights, sounds, and fury.

They are made by entities such as the army-funded research center, the Institute for Creative Technologies (ICT) at the University of Southern California (USC), which develops and markets video games such as Full Spectrum Warrior while creating additional immersive digital tools and military training platforms that are regularly leveraged into entertainment markets (ICT, 2010; Korris, 2010). Arms manufacturers invest in Hollywood and Hollywood in arms manufacturers (Hozic, 2001, pp. 135–168). Indeed, the extent of cross-ownership between Hollywood, arms manufacturers, Silicon Valley, bio-tech, and the wider quotidian economy of white goods, widgets, and Wonder Bread is unprecedented (Turse, 2008). Those of us who are fortunate enough to be members of pension funds or players on the stock market tend to follow the example set by such corporate cross-investment. Meanwhile, more than half of American federal discretionary spending regularly goes to the procurement of military goods and services (Hedges, 2009, p. 153), while any hopes that an Obama administration might be able to slow down the machinations of “the permanent war economy” (Melman, 1974) are fading under the hot, harsh light of the twenty-first century’s own emergent *realpolitik*, assisted in no small measure by a Republican Congress. Previous reports of the MIM-plex’s growing influence now hardly seem exaggerated.

Yet, despite this state of affairs, significant gaps in media research on the MIM-plex remain. With a few notable exceptions (Berland & Fitzpatrick, 2010; Der Derian, 2001; Dyer-Witheford & de Peuter, 2009; Hozic, 2001),¹ extant work, taken as a set, is a little recursive in its analytical remit, focusing primarily on military–media cross-ownership and concentration (Turse, 2008), its myriad technological outcomes and their implications (King, 2010; Winseck, 2008), and the ongoing spectacularization of war (Compton, 2004; Giroux, 2006; Power, 2009; Retort, 2006). This body of writing is extremely valuable nonetheless, and it provides the necessary foundation for a wider body of work, still to be written, which aims to understand an even greater number of the broad social, political, and cultural implications of the MIM-plex in its manifold incarnations. To be sure, as a large, amorphous, tentacular, transnational macro-political formation whose various names all aim to describe its sobering ubiquity, the MIM-plex can be a daunting object of analysis. But scholarship already suggests that the MIM-plex (and many of its namesakes) constitutes something more than a new name for hyper-capitalism or a new short-hand for left-leaning polemicists (often bent on a pessimistic determinism). It is, rather, a potentially efficacious way to characterize the global socioeconomic frame inside of which most goods and services are now produced. It is therefore a potentially useful heuristic device, which we can deploy in order to better illuminate the structures inside of which we work and live; inside of which media producers both enable and resist the imperatives of an ever increasingly militarized global capitalism.

Given this increasingly militarized constitution of contemporary global capitalism, and given the increasingly prominent position that the media industries inhabit within it, studies of media work that deploy the heuristic device of the MIM-plex – on blockbusters celebrating imperial firepower, on television news programs creating

and re-creating new castes of global enemies, on massive multiplayer online war games – ought to matter now more than ever. Yet, when it comes to thinking about the MIM-plex, the research trajectories of production studies, like those in other media studies neighborhoods, seem to stop somewhat short, and somewhat automatically. Production studies rarely situates its sites of inquiry with the analytical frame of the MIM-plex at the ready, and a more wide-ranging approach to our objects of study may now be in order. Undertaking such an approach ought to do us, as media production scholars and as media scholars more generally, a great deal of good. For thinking more regularly with the MIM-plex might likewise require us to amend an assortment of assumptions about how media studies matters – or ought to matter – to others in the wider world of academic, policy, and activist research. Consider, for example: Within an international political economy cracking under the weight of worldwide wars conventional and non-conventional, braking at the precipice of planetary environmental catastrophe, and balking at real recovery from global financial meltdown, how might our particular expertise in mediated meaning-making matter to a field that, in general, finds itself more frequently called upon by governments for its own particular expertise? How might media studies matter, for instance, to international relations?

According to a multiplicity of its own practitioners, the field of international relations has been enduring a prolonged methodological crisis for some time now.² Erected in a less problematically mediatized moment of the last century,³ IR's dominant "realist" theoretical frame was constructed using the grid-like certainties of the nation-state, military force, and pre-digital economies of innovation. Mainstream IR has been less swift to embrace the late twentieth century's cultural turn than many other neighborhoods in the academic world. This likely has a great deal to do with the perpetually chaotic conditions attached to its object of study. At a first glance, realist IR, prioritizing as it does analyses of competitive individuals, sovereign states, and the international system to the exclusion of much else – including most matters of central concern to media and cultural studies – would appear to have every reason to command its own ascendance within the field. After all, even after the cultural turn, international relations do appear to continue to run largely by state- and quasi-state-led logics, which pertain in no small order to monopolies of violence and in which, as a consequence, "culture" may often take on "an aura of frivolity" (Walker, 1990). As such, it is all too frequently theorized as "that residual realm left over after all forms of observable human behavior have been removed" (Stephanson, 1994, p. 110) – in other words as merely the icing on the cake of global politics.

But, since the fall of the Berlin Wall, realist IR scholars have been engaging with poststructuralists, constructivists, feminists, and others who share a certain minoritarian status within their own discipline, in the hope of theorizing a planet increasingly characterized by postnational, postindustrial, posthuman, post-everything uncertainty and risk – a planet that, often now, seems nearly untheorizable within conventional IR frameworks. Inside this newer conversation, the matter of culture has figured quite centrally. Taking place largely to one side of those debates on glo-

balization and culture that are familiar to media and cultural studies practitioners (see, for example, Thussu, 2009, 2010), this somewhat more specialized debate on the place of culture in the international system has been halting and productive in turns. Despite the long-standing efforts of non-realist IR scholars, and indeed despite the efforts of media scholars in international communications studies, with whom many IR specialists are already in regular dialogue (see, for instance, Sarikakis and Shade, 2008a), the long-term influence of culture on conventional IR theorizing remains unclear. Still, in IR neighborhoods with growing populations and influence, a wider awareness of the blind spots built into the field's traditional approaches has lately begun to emerge.⁴ No longer merely an afterthought (after statecraft, after warcraft, after the economy), culture is beginning to appear to many as a more significant and efficacious analytical tool than IR has conventionally assumed. Despite a collective uncertainty as to where the dialogue may ultimately lead, culture, especially as it is produced and conveyed through mass media and through various information and communications technologies, is gaining a new and notable traction inside IR.

The fields of IR and that of media and cultural studies have talked before. But, although notable interventions have already laid important ground for a dialogue between IR and media and cultural studies (Comor, 2001; Gillespie, 2006; Hoskins, 2006; Hoskins and O'Loughlin, 2010), mainstream scholarship in each academic neighborhood is only beginning to realize fully the utility of such an initiative. I want to propose in this chapter that researchers in media and cultural studies ought to rejoin at once the recent dialogues on the place of culture within IR theory and practice. Media studies practitioners, I wish to argue, ought to play a more central part in revealing, to a field still largely immersed in the exigencies of *realpolitik*, how political and economic power are made operational within mass and cyber-mediated representations. As Aida Hozic has argued so cogently in relation to "Hollywood" and the "Digital Coalition" (descriptors of the MIM-plex coined by herself), "power is nothing but the ability to organize fantasies," and for this reason the American film industry is properly understood as "political":

not only because it is related to the well-known loci of power – state, presidency, war machine, or because it is capable of presenting first-rate propaganda, but because it is itself sitting on the fence of real and fantastic, because it is itself capable of producing alternate spaces and histories, and because it is itself nothing but the organized public fantasy. (Hozic, 2001, 13)

Hollywood's capacity to sit "on the fence of real and fantastic," according to Hozic, produces other notable capacities as well. Not least among them is the capacity to obfuscate "the distinctions between public and private, politics and economics, work and leisure that have long been regarded as the foundation of modern capitalism" (and, one might add, as the foundation of realist logics inside IR) (*ibid.*, p. 159). As we shall see, other precincts of the MIM-plex share such capacities: most importantly

perhaps, distinctions between military and civilian are becoming increasingly blurred. Given media studies' familiarity with arguments such as Hozic's (herself an IR scholar) on the power of representation, the fact that conversations between media studies (including production studies) and IR have not deepened and broadened seems a lost opportunity.

I also want to propose, however, that media studies has a lot to gain from enjoining our colleagues in other disciplines such as IR, and for reasons that extend beyond charity or proselytism. Certainly our own perspectives on the myriad relationships that exist between power and representation provide ample reason for us to engage more frequently with those of our IR colleagues who are now asking questions about these same relationships. But IR's recent turn to various precincts outside its conventional purview in search of answers to its own disciplinary dilemmas (Diplomatic History, 1994; Millennium, 2003; Security Dialogue, 2007) has had a salutary effect on the field as a whole – something that many scholars inside media studies are now trying to provoke as well. I want to join recent calls for a wider dialogue between media studies and other disciplines (Couldry, 2006; Hesmondhalgh, 2011; Hesmondhalgh & Toynbee, 2008) by suggesting that we would now do well to follow IR's example in this regard.

IR's new focus outward has been salutary in no small part because of theoretical and methodological lacunae inside the discipline that have been revealed and attended to as a consequence. Media studies ought to use new opportunities for a dialogue with IR as a means of re-examining one of its own abiding theoretical–methodological difficulties: work inside an ostensibly progressive media studies is often just as guilty of treating feminist analysis as a kind of secondary analytical tool as is the ostensibly more conservative field of IR. Despite some laudable exceptions (Huws, 2003; Mayer, 2005, 2011; McKercher & Mosco, 2007), studies of media production are no less culpable in this regard (on which see McLaughlin, 2008). Moreover, notwithstanding our expertise on the subject, an abiding, excessively binaristic approach to the matter of representation is often directly linked to media studies' often less than holistic integration of feminist analysis. Such an approach, as we shall see, generally sets matters of “representation” against matters of “action” and then manages to slide down an entire hill of suspect pairings, landing rather too easily at an epistemic bottom where women are somehow native to the domestic sphere, while men happily inhabit the public one (on this, see also Elshtain, 1981; Fraser, 1992; McGuigan, 1998). In undertaking further dialogue with scholars, policymakers, and activists outside their own field, then, media studies researchers need to pay careful attention to the influence of a pervasive masculinism from inside of it – a masculinism that has often diluted both the significance of entertainment and the role of entertainment labor within discussions of media power.

IR scholars sympathetic to the study of culture might in turn consider the dubious gender politics attached to one of IR's more widespread synonyms for culture: “soft power.” I shall expand upon this idea below, and with no small degree of humility, given the blind alleys (both epistemic and strategic) that media scholars have them-

selves encountered when undertaking their own analyses of relations between a problematically feminized "culture" and a purportedly masculine "global public sphere." A brief look at one small corner of the MIM-plex, USC's Institute of Creative Technologies, gives us a chance to see how dangerous such gendered and sexualized assumptions are to cogent research in both media studies and international relations. For it turns out that there is very little that is "soft" about the power that entertainment labor produces at institutions like the dubiously named institute. Indeed, when one considers matters of power and representation within the analytical frame of the MIM-plex, it turns out that, quite often, there is very little that is soft about soft power at all.

A few words on method and the MIM-plex are warranted, however, in advance of our visit to the ICT.

Thinking with the MIM-plex

In June 2009, international entertainment capitalism's paper of record, *Weekly Variety*, touted a notable banner headline: "TANKS A LOT, UNCLE SAM," it shouted, while the sub-headline below explained the pun: "Pic biz, military coordinate battle plans for mutual benefit." In the article that followed, Peter Debruge described how closely the producers of that summer's top blockbuster, *Transformers: Revenge of the Fallen*, cooperated and collaborated with four of the five branches of the US military. "Only the Coast Guard sits this one out," Debruge noted with a mixture of dread and admiration. He also noted that each branch of the US military "maintains a satellite office in Los Angeles to liaise with the entertainment industry, on everything from giant-robot action movies to documentaries to series such as 'NCIS' or 'Army Wives.'" The army, Debruge went on to point out, "even lent a hand when a soldier appeared on 'America's Got Talent'" (Debruge, 2009, pp. 1, 9).

With all due respect to *Variety*, this is not necessarily banner news. In fact, the Academy Awards' first winner for Best Picture was the spectacular *Wings* (1927), which served as a military recruiting vehicle for many subsequent years, and which had heavy backing from the War Department. Collaboration between the Pentagon and Hollywood, then, is nearly as old as the American film industry itself (Boggs & Pollard, 2007). However, as I have suggested elsewhere and as *Variety*'s own reporting on the *Transformers* sequel also suggests, what now warrants our careful consideration is the ubiquity, sophistication, and complexity that have lately come to characterize such collaborative nodes (Burston, 2003). The fact that the computer games industry, which now regularly dwarfs Hollywood in various sales-related statistics, is thoroughly saturated with such arrangements likewise repays our attention. Indeed, the reach of the MIM-plex extends much further even than this. Since 9/11, American propaganda operations have expanded well beyond their traditional locations in state-funded bodies like Voice of America or the Arabic-language Radio Sawa, extending

their reach far into the corporate sector, including PR firms and mass media. Such expansions are doctrinal rather than accidental. One recent compilation, originally conceived by former instructors at the Joint Command, Control, and Information Warfare School of the US Joint Forces Staff College, calls for “horizontal as well as vertical integration and cooperation, [including not only US Government] agents and departments, but also non-governmental units and private industry as well,” so that information operations (IO) may “become the true force multiplier that it has the potential to be” in twenty-first-century battlespace (Armistead, 2004, p. 47; also see Arquilla & Ronfeldt, 1997). As a result, observes Dwayne Winseck, “the lines between public affairs and media relations, on the one hand, and propaganda and psychological warfare, on the other, have blurred beyond recognition” (Winseck, 2008, p. 425). Instances of this kind of blurring abound everywhere, even when neither the hand of the state nor that of its corporate proxies are obviously in evidence. So, for example, Michael Butterworth and Stormi Moskal (2009) describe “an unprecedented overlap between military and sporting discourses” since the end of the Cold War and the advent of the “war on terror” (Butterworth & Moskal, 2009, p. 415). They go on to write that, “[i]n the wake of 9/11, the blurring of sports and war has found additional strength. The past several years have brought near constant reminders of the American military through baseball stadium rituals,” “NFL ‘kickoff’ ceremonies,” “NASCAR (auto racing) displays of belligerent patriotism, and an almost endless list of military appreciation events at college football games” (ibid., p. 416).⁵ Perhaps most importantly, the blurring of boundaries between the social and the martial is not simply limited to spectacle and propaganda. As the popular historian Nick Turse properly reminds us, “[t]he high level of military–civilian interpenetration in a heavily consumer-driven society means that almost every American (aside, perhaps, from a few determined anarcho-primitivists) is, at least passively, supporting the Complex every time he or she shops for groceries, sends a package, drives a car, or watches TV” (Turse, 2008, p. 18).

A daunting heuristic device indeed, this military industrial media complex. What, then, can we say about it if we are to turn the term into something useful, into something more than a phrase that, in its propensity to reify, obscures more than it reveals? What can we say about the MIM-plex that actually illuminates our current condition and provides us with a map for future production research?

To start with, we must repeat and ultimately embrace its inevitable complexity. For in its complexity, and to borrow, *mutatis mutandis*, from Hesmondhalgh’s landmark work on the cultural industries, the MIM-plex is also a place of great ambivalence and contestation (Hesmondhalgh, 2007). Second, because of the complexity of this vast formation, we must acknowledge that it will require different methods with which to study the various practices, objectives, and outcomes of its various actors. An approach as catholic as this can remind production studies researchers that the MIM-plex is not so much a thing to be studied as it is an aggregation of forms, relations, and sites inside an increasingly militarized global capitalism, where cultural workers – sometimes willingly, sometimes otherwise – engage in its perpetual and

widespread reproduction. Needless to say, research objectives need not work to reify the MIM-plex by attempting to define, for example, its formidably expansive parameters. Such initiatives risk the promotion of an inherently defeatist *telos*.⁶ Research objectives, rather, might best locate and theorize discrete instances of MIM-plex production – ultimately, one hopes, toward its incremental transformation (the old saying that the best way to eat an elephant is one bite at a time is probably quite apt in this instance). Our own discrete instance of MIM-plex production here is the Institute for Creative Technologies.⁷

A Powerful Question: Culture, Power, and the Institute for Creative Technologies

ICT was established in 1999 with a multi-year contract from the US Army to explore a powerful question: What would happen if leading technologists in artificial intelligence, graphics, and immersion joined forces with the creative talents of Hollywood and the game industry? (ICT, 2010)

Born in 1996, the ICT is the result of a grant from the US military and is affiliated with the University of Southern California in Los Angeles. At the ICT, technologies of the digital spectacular are being developed simultaneously as entertainment technology and as cutting-edge military technology. Its mission statement reads:

The mission of the ICT is to build a partnership among the entertainment industry, army, and academia with the goal of creating synthetic experiences so compelling that the participants react as if they are real. The result is engaging, new, immersive technologies for learning, training, and operational environments. (<http://www.ict.usc.edu>)

The ICT is housed in Marina Del Rey offices planned by *Star Trek* production designer Herman Zimmerman, and Hollywood management there has included former senior executives from the National Broadcasting Company (NBC), Paramount, and Disney. They work hand in hand with the military and with designers from the digital effects houses of Silicon Valley, who are otherwise busy transforming movies, videogames, and amusement park rides as we know them.

Hollywood and Pentagon representatives at the ICT have collaborated in the development of military training platforms that double as commercially available video games – such as C-Force, Full Spectrum Warrior, and others. The ICT has sponsored brainstorming events with Hollywood creatives in the service of future US-sponsored counterterrorism efforts. Last but certainly not least, the ICT also develops immersive environments exclusively for training use by the military, all of which are instantly evocative of *The Matrix* and feature digital actors equipped with state-of-the-art artificial intelligence. The monstrous moral implications of this kind

of “virtual war” have already been well expostulated by James Der Derian. On the battlefield, the enemy soldier has become nothing more than an avatar in a videogame, “an electronically signified ‘target of opportunity’”; one whom we may eradicate with greater psychic ease than we can eradicate his carbon-based ancestor; one who is thus “much easier to ‘disappear,’” both in the symbolic and in the material register (Der Derian, 2001, p. 120).

If we think for a moment about how the activities of the ICT work, on the one hand to aestheticize politics by turning war into a game, and on the other to politicize aesthetics by transforming games into killing machines, we begin to see how new forms of “militainment” do a pretty good job of tearing apart a whole series of conventional assumptions about what “culture” is and what its relative importance might be to matters of global peace and security. Where does cultural commodity end and military technology begin, for instance, when it comes to commercially released video games like *Full Spectrum Warrior*, which double as training platforms for the marines?⁸ Despite the obvious ways in which both fields could work to illuminate the transformative dynamics inherent in production sites such as this one, this particular conjunction between entertainment and military power remains, to my mind, undertheorized both in media studies and in international relations.⁹ One significant reason why this is so is that, despite the presence of outstanding feminist scholarship in both fields, blind spots on matters of gender interfere with both IR and media studies thinking questions of power and representation together. We need to turn to this problem now.

Hard Power, Soft Power, and the ICT

Most media studies scholars have little difficulty identifying the fundamental links that exist between the free, diverse, and equitable flow of cultural expressions and the cause of global peace and security. Communications policy functions, for instance, as “a major determinant of the context in which other sectors (such as healthcare, education and job training) will develop in the current phase of globalization” (Raboy, 2002, p. 114). As such, Marc Raboy rightly suggests, communications policy needs to be understood “as a profoundly political issue, as part of the struggle for the democratization of the new global governance system” (ibid.). Indeed, this understanding of communication and culture as always already political forms the basis of our own field of study. But, for the great majority of IR-influenced policymakers who attend to matters of global security, cultural power, in the words of IR eminence Joseph Nye (2004), is soft power. Soft power, according to mainstream policy, is important, but only secondarily: after we’ve attended to failing states, global warming, arms buildups, and so on. Soft power has become a popular phrase inside IR – as it has in less specialized, mass media discussions of global politics. Both China and India have adopted soft power as a formal component of their foreign policy platforms; Hillary

Clinton deploys the phrase frequently; and IR literature debates its merits on an ongoing basis.¹⁰

Media studies ought to argue against mainstream assumptions such as these.¹¹ We ought to be demonstrating how the expression "soft power" obfuscates as much as it clarifies. We need to show our IR colleagues how, in its semantic downgrading of cultural and communicative practices, a concept endowed with the freighted gender politics of "soft power" can in fact reproduce relations of power that arguably help aggravate the prospects for global peace and security.

What precisely is the phrase "soft power" meant to convey? At its most innocuous, "soft power" is meant to describe "the ability to use politics and culture" rather than weaponry, in order "to pursue [. . .] strategic interests (Lowe & Spencer, 2006, p. 9). So, according to Nye (2004), whereas "hard" power, military and economic, uses coercion, soft power uses attraction. Whereas hard power promotes the government use of war as means to a given end, soft power suggests diplomacy – coupled with the power and influence that comes, in America's case, with the real estate that headquarters the world's most important media and entertainment corporations. Whereas threats and force are military power's primary currency and payments or sanctions are the currency of economic power, soft power deploys "culture." In the high-cultural realm, this deployment might take the form of artistic exchanges or of Fulbright programs. In the realm of popular culture, movies and television are often understood as the most prominent soft-power vehicles (Nye, 2004), though the Internet needs to join that list too. Indeed, Nye speaks of the need for "information power" to be coupled with soft power and influence.

The problem with such suggestions is this: Despite binaristic formulations that posit hard military power on one side of the social equation and soft cultural power on the other, it is no longer always productive to think about cultural power and military power separately. One need only spend a little time at the ICT website before choosing quickly to stop thinking about the X-Box or *Full Spectrum Warrior* as Silicon Valley's key *cultural* export. Instead, one comes to think of it as Hollywood's primary military export. With the advent of militainment, the intricate relationships between popular cultural forms and military technology have all become rather difficult and confused, but this much is certain: Very little can be said to be "soft" about the kind of cultural power the self-proclaimed Institute for Creative Technologies administers. That this statement is so obviously true, and yet so counterintuitive at the same time (the ICT, after all, promotes itself as a think tank for the entertainment industry), suggests that an even deeper problem lies at the heart of the hard power/soft power binary – a problem embedded in the dynamics of binaristic thinking itself.

We think a great deal with binaristic constructions like hard power/soft power, but binaries do not always produce good thinking. Very often, they function as little more than a simplistic short-hand that leads us toward inauspicious generalization. There also exists a suspicious dimension of domination, a questionable "relation of power between the poles of a binary opposition" in which one term is implicitly valorized at the expense of the other (Hall, 1997, p. 235). Binaries such as "hard/

Table 3.1 Implications of the hard power/soft power binary

Hard power	Soft power
Military power	Cultural power
World of action	World of representation
The Pentagon	Hollywood
Martial sphere	Civilian sphere
(Legitimate) masculine pursuits	(Suspect) feminine pleasures
Public sphere	Domestic sphere

soft,” for instance, or “hard power/soft power” are closely connected in discourse to others such as “military power/cultural power,” “The Pentagon/Hollywood,” and “action/representation.” These in turn are frequently linked in discourse to binaries such as “public sphere/domestic sphere,” and, last but certainly not least, “masculine pursuits/feminine pleasures.” The implications of such thematic linkages are perhaps more easily viewed when these binaries are laid out in a table (see Table 3.1).

We may begin to see how the problematic politics of gender is often lurking just below the surface of a great deal of IR policy work. But two larger points need making here.

The first is that policy that thinks binaristically – that thinks “politics” on the one hand and “culture” on the other, or “hard” power now and “soft” power later – prevents us from fully understanding the realities that lie before us all in the task of building a peaceful planet in the twenty-first century. Forward-thinking IR scholars have already suggested some of the dead ends one encounters when pursuing (often tacitly) masculinist policy goals, and they are hardly rooted in problems of “mere” semantics. Questions of language, after all, often point us to deeper questions, such as how structures of gender inequality are reproduced in discourse. So, for instance, as IR scholar J. Ann Tickner (1996, p. 156) has argued, “the unequal roles of protector and protected, assigned to men and women respectively” through policy and in everyday language, not only render women second-class citizens everywhere. They also “reinforce national identities that prioritize war and conflict. These masculinized, militarized identities,” Tickner continues, “which depend on their relationship to devalued characteristics associated with femininity, have been important for states in legitimating their foreign policies.” Therefore to say that state-to-state (or state-to-quasi-state) conflicts are not problems embedded in cultural conditions is really to ignore a rather large elephant in the room.

In this light, then, it is not so much that culture is an object of politics as that politics is an object of culture. Amy Kaplan (1994, p. 99) unpacks the argument further: “Culture,” she writes, “has been excluded from foreign policy on grounds traditionally associated with the ‘feminine.’ [. . .] In this formulation, politics is to culture as man is to woman.” As a result, she continues, “[t]he discursive field of diplomatic history seems to be organized in part around the exclusion of both culture and gender, which are subordinated to the realm of the domestic, a sphere associated with the home and

women." It is for reasons such as this, Kaplan suggests, that "both sides of the inaugurating debate of diplomatic history defined the 'realism' of foreign policy as a realm of rational calculation, cordoned off from the exigencies of the cultural."

The second point that needs making is that avoiding such blind spots now becomes an increasingly important charge for media studies, too, insofar as the machinations of the MIM-plex are very much our own concern, and also insofar as media and cultural studies have always understood themselves as fields of study dedicated to changing the world and not merely to describing it. It appears, however, that this is more easily said than done. By and large, media studies scholarship also falls far too frequently into the gender-binary trap – to the extent that our own capacity to make sense of the hows and whys of the military industrial media complex, for instance, is dangerously compromised as a result. As I have argued previously (Burston, 2003), for media studies, comprehending the politics of entertainment programming still seems generally to matter more as a buttress to the theoretical needs of media scholarship on news-gathering. Inquiries into the dynamics of entertainment capitalism are understood to be useful only when they shed light on the octopcean nature of media capitalism more broadly, or when they reveal emerging nuances in the realm of ideology. The information/entertainment binary is as stickily hegemonic as it is because entertainment, as a category of production, reception, or analysis has conventionally been understood as more oriented toward the private, domestic, "feminine" sphere. Still the source of a powerful wariness for far too many of us in the field, the world of fictional representations and of their suspect pleasures is best left to savor in times of quiet reflection, preferably in the private space of one's own home. Wiser, thinks media studies as a rule, to leave the public realm available for "the real thing": for mobilization, for engagement, for politics traditionally defined (and, of course, for reporting the "hard news" on all of the above). I've said it before, but it bears repeating: Clearly, real men don't work in Hollywood (and they don't write about it much, either). This kind of binaristic logic prevents otherwise perfectly good thinkers in each field from thinking clearly about how "soft" cultural power, and "hard" economic and military power all combine inside the MIM-plex. Media studies may need to do a little theoretical house cleaning of its own, then, before it can effectively explain to a large and "establishmentarian" cohort of foreign-affairs policymakers why separating the realms of culture and politics is dangerously misguided; why the realms of culture and politics must instead be understood as profoundly intertwined.

Disciplinary Dialogue, Global Security, and the Purview of Production Studies

The activities underway inside Hollywood's new martial precincts reveal how carefully we now need to think about cultural workers whose professional circumstances

are increasingly tied up with things other than culture – at least as conventionally defined. The ICT and many other similar nodes of collaboration between Hollywood, Silicon Valley, and the military suggest that we clearly need to examine the ways in which cultural workers are deeply invested in the MIM-plex and the particular ways in which they necessarily constitute an integral element of global security politics as a result. Production studies now needs to consider those cultural workers whose professional circumstances have a new and disturbing specificity, which we have yet to fully acknowledge.

Cognate work outside the field of production studies has begun to do precisely this. Elizabeth Losh (2009) and Nina Huntemann (2010) have each deployed some measure of on-site research in order to unpack the production politics of the ICT and the computer game-cum-recruiting vehicle, America's army, respectively. But work that explicitly undertakes production ethnographies has the best potential to reveal how the politics of making representations and the connotational politics of the representations themselves are ultimately so intertwined as to be inseparable. This is where we come in. Media ethnographers ought to uncover the regimes of control and the spaces for agency that form militainment workers' work practices, professional subjectivities, sense of duty, and sense of options. This is not as difficult an assignment as it may first appear. Despite the presence of some very large "no-go" zones inside the military entertainment establishment, there remain numerous small, "flexible," or independent operations – subcontracted digital animation companies, for instance, which are likely open to enquiry in ways in which suburban Virginia has never been (and never will be). In any event and whatever the circumstances, fieldwork in the trenches of Siliwood is now absolutely essential if we are ever to make any sense of the many complicated sites of struggle on the new terrain of twenty-first-century popular warfare culture.

More broadly, in choosing to think with the MIM-plex in production research, we may assist media studies as a whole in accomplishing a very important task. As the ICT's example ought to make clear, it is now necessary for matters cultural to be visible outside of the same old "soft" policy precincts where, traditionally at least, few of the really big decisions on matters of global peace and security are made. Media studies scholars ought seriously to consider taking up the task of intervening in policy debates – most especially in policy debates taking place outside the carefully policed boundaries of a largely feminized (and consequently subordinate) cultural-policy ghetto. If we do not, then we risk perpetuating the gendered split inside global policy production that has long kept cultural policy so marginalized in international fora (on which see Beale, 2008). In an era where an institute for "creative" technology can reasonably represent itself as such, this status quo cannot – must not – hold any longer.¹²

Some readers who are new to debates regarding the parameters and purpose of media studies may find calls like the one I am making here a little surprising. How is it, they may ask, that, in a field that aims to understand the forms and functions of the Fourth Estate, matters of policy are considered to be largely off limits? Why have media researchers who are not directly engaged in the fields of political or

international communication largely eschewed – at times even disdained – the study of the intersections of media practice with the politics of state power? Nick Couldry (2006, p. 5) furnishes us with the beginning of an explanation when he writes:

[T]he edifice of classical thinking about democracy and ethics evolved well before the full emergence of modern media institutions. Media don't integrate well into either political theory or ethics because, historically, they were not intended to. As a result, while the consequences of mediated access to the political process should be a central consideration within political theory, they are surprisingly marginal.

Media scholars have had reasons of their own for this state of affairs and for the delegation of such concerns to particular subfields within the wider discipline. Many have been more interested in establishing their own specific criteria for the selection of objects of study in what still remains a relatively new academic field. This may be especially true of media production studies, which, having emerged as a distinct subfield even more recently than most, has concerned itself, quite properly, with charting its own borders. These are borders that, understandably enough, largely limit the range of our inquiry to the conditions and experiences of labor in the media and in the cultural industries and to their adequate theorization (Beck, 2003; Hesmondhalgh, 2007; Mayer, Banks, & Caldwell, 2009). Other reasons pertain more directly to questions regarding the actual utility of examining state power. Some media studies researchers, for instance, still labor under the misapprehension that the state is being subsumed (rather than transformed) by transnational corporate power and that studies of media practice and reception are, accordingly, better fitted to the transnational register. And scholars with feminist sympathies tired long ago of the many phallogentric assumptions attached to older notions of what properly constitutes the political, looking first to the (once) new social movements, and then to affective communities and other social formations for cues on how best to study the transformational potential of cultural practices.

Happily, over the course of the last three decades our engagement with newer political precincts such as these has finally brought media studies kicking and screaming into maturity. Indeed, whatever fullness and variation we can attribute to the wider field of media and cultural studies, it owes a certain debt of gratitude to the "Thirty Years' War" between media political economy and cultural studies. But, even as those battle lines begin to fade, the ambiguous legacy of a somewhat tense peace remains. It often takes the form of a broadly consensual understanding formed among media studies scholars who work outside the subfields of international and political communication – an understanding along the lines that, really, state power (subsumed, transformed, or otherwise) is someone else's academic business, not ours. In effect: there are few practical or theoretical vectors joining media studies to the study of global struggles for power, conventionally defined, and few concepts or practices linking the districts of media studies to those of international relations (among others).

Properly focused examinations of the now myriad articulations of the MIM-plex can and do reveal how, at this historical juncture, such assumptions may be more than merely misguided; they may be dangerous. Media scholarship can no longer ignore the role that global politics plays in innumerable instantiations of media practice – not any more than international relations, political sociology, and political science can ignore the role that media practice plays in the production of global politics. This is especially true given the degree to which mediated representations of violent cyber-patriotism and cyber-sectarianism are now located precisely at the center of mainstream popular culture – not only in the global North, but in the global South as well (Dyer-Witheford & de Peuter, 2009; Stahl, 2010). Scholars seeking to understand the dynamics of work inside sites such as the ICT, which produce the physical and virtual goods of militarized entertainment capitalism, are especially well positioned to advance such arguments. Moreover, continued research into different precincts of the MIM-plex will likely have the salutary effect of focusing the production studies lens on a still underexamined neighborhood of media production, even as it begins to tease out larger questions that production studies scholars now need to ask of their research, such as: For whom, precisely, are the subjects of our ethnographies working? And does this work contribute to the social good?

Previously, such questions were often eschewed by production studies researchers, as they could (and did) often link up to a set of high-cultural aesthetic assumptions that could blindside a progressive politics of pleasure and emancipation. But in the era of the ICT the stakes have clearly changed. In their own recent examination of the video-game industry, Nick Dyer-Witheford and Greig de Peuter argue that, inside a militarized global capitalism, games such as the ICT's *Full Spectrum Warrior* (FSW) generate "subjectivities that tend to war" – not merely by eliciting in their millions of players a desire for extralucid depictions of atrocity, but by promoting, hand in hand with multiple other media outlets, war's most sinister *banalization* in addition. "FSW contributes to the broader banalization of war," Dyer-Witheford and de Peuter (2009, p. 118) observe,

by promoting uncritical identification with imperial troops; by rotely celebrating the virtue of their cause and the justice of their activities; by routinizing the extermination of the enemy; by diminishing the horrors of battle and exalting its spectacle; by forming subjects of, and for, armed surveillance; by investing pleasurable affect in military tactics and strategy; and by making players material partners in, and beneficiaries of, military-technoculture.

Adding insult to virtual injury, FSW does this even as it deploys fictional story lines rooted in contemporary events in Iraq and Afghanistan. In such a manner does the "[v]irtual involvement of civilian populations in actual imperial war [make] military games a homefront component of full-spectrum dominance" (2009, p. 118).

These linkages between virtual representation and actual military power, I wish to suggest once again, are best explained to scholars from other fields by way of a dialogue with media studies scholars. But such a reinvestment in media studies' tentative dia-

logue with international relations will do more than assist other scholars in expanding their own purviews and methodologies. It will also serve to remind us, media studies practitioners (including those of us engaged in production research), that ours is a field of fundamental importance to many others – a reality that we have often forgotten while undertaking the (often) somewhat monastic task of defining ourselves. In remembering this, however, we will be in a position (to borrow from Couldry again) to bring “to an important interdisciplinary question (the preconditions of democratic politics)” media and cultural studies’ pronounced and abiding interest “in agency and voice and the forces that constrain them” (2006, p. 75).

Inhabiting a similarly commendable ethical register, David Hesmondhalgh and Sarah Baker have recently written of the need to consider “how positive and emancipatory aspects of labor – including creative labor in the cultural industries – might be made more prevalent, and how negative aspects of work might be contained, controlled or even eliminated.” Underlying this question, they maintain, “is a deeper one: which political projects may best enhance human well-being and social justice with regard to work?” (Hesmondhalgh & Baker, 2011, p. 222). They rightly suggest that, within what is now a burgeoning literature on creative work, these are fundamental issues that have yet to be thought through in their entirety. Now it may be that we will never all concur on the relative merits of various types of entertainment programming, but surely we can all agree that, ultimately, neither the banalization of war (Dyer-Witheford & de Peuter, 2009) nor the increasing ease with which we may now banish enemy combatants from our consciences (Der Derian, 2001) contributes much to the cause of social justice or to the planet’s health in general. The field of production studies has a major role to play in remedying the situation Hesmondhalgh and Baker describe, and production research on the MIM-plex in particular provides an especially compelling set of research objects toward that end.

Here, however, production studies scholars should not lose sight of the role that a more fully integrated feminist analysis must necessarily play in such an undertaking. The gender binaries that appear so regularly to interrupt the progress of a more holistic set of trajectories in international relations have everything to do with the regular promotion of “public man” on the one hand and with a concurrent demotion of symbolic representation by virtue of its often unstated, but nonetheless powerful association with “private woman” on the other (Elshtain, 1981). This is the relationship of “hard power” to “soft power”; of how, as Amy Kaplan explained above, “politics is to culture as man is to woman.” This state of affairs is only too familiar to media studies practitioners. A tradition of feminist media research that is arguably longer than its IR counterpart has somehow failed to prevent a similarly binaristic way of thinking from rendering problematic a great deal of our own work. Endeavoring to change this state of affairs is also part of the ethical project that is now required of media and production studies. Charting new forms and relations that emerge from inside the MIM-plex provides us with one important way forward, insofar as a number of its most emblematic precincts appear to confound the already dubious distinctions between hard and soft power once and for all.

NOTES

- 1 While both Hozic and Der Derian hail from international relations, it is precisely the commendable holism in their work that permits the latter to be read and understood by media scholars as “media research.” As I argue below, their dialogical example warrants the emulation of media studies scholars seeking to expand their own purview. My thanks to Keir Keightley for talking me, over several helpful conversations, through some of the ideas developed in this chapter.
- 2 See Lapid and Kratochwil (1996), Smith, Booth, and Zalewski (1996), Brecher and Harvey (2002).
- 3 After Auslander (1999), I loosely follow Baudrillard’s (1981) deployment of the term “media-tization” insofar as it describes the media “as instrumental in a larger, sociopolitical process of bringing all discourses under the dominance of a single code” (Auslander 1999, p. 5). I do this, again, following Auslander, even as I eschew Baudrillard’s fatalism more generally.
- 4 See Booth (1996), Lapid (1996), Walker (1990), and Lawson (2006). For feminist interventions from inside IR, see Enloe (1996), Zalewski (1996), and Sylvester (2002).
- 5 Also see Stahl (2010), and especially Burstyn (1999), which provides a superb elucidation of the “sport nexus” and of the “sport-media complex”: these work together to promote and maintain a pervasive, hyper-masculine militarism in the US and abroad.
- 6 On which see Pick (1993, p. 11). Also see Hardt and Negri (2004, p. 40).
- 7 Some of what follows derives originally from Burston (2003).
- 8 *America’s Army* provides another famous example. See Nichols (2010) and Huntemann (2010). Various other activities of the ICT similarly suggest a number of ways in which cultural production and the production of global insecurity are indeed rather formidably intertwined. See Burston (2003), Dyer-Witheford and de Peuter (2009), and Huntemann and Payne (2010).
- 9 This, despite a slowly emerging body of research on the ICT (see previous footnote).
- 10 A sampling of these debates is available in Berenskoetter and Williams (2007), where Steven Lukes counts himself among the detractors of the term, declaring it “a blunt instrument” (Lukes, 2007, p. 95). Most of us in media studies ought to be able to come to the same conclusion (though possibly for different reasons).
- 11 And in making this argument I am building on arguments already put forward by constructivist, postpositivist, and feminist scholars in IR and by a number of thinkers in media and cultural studies who are supportive of IR’s “Third Debate” on such matters. For a useful overview of this debate, see the items cited in footnote 4. For a useful recent contribution from media and cultural studies, see Van Zoonen (2005).
- 12 The recent call for “a more synergetic and collaborative approach” to the study of communication “among scholars from different traditions and backgrounds” and to the centrally important task of participating in global policymaking, a call launched by Sarikakis and Shade (2008b, p. 14), commands my vigorous assent.

Television-Set Production in the Era of Digital TV

Mari Castañeda

ABSTRACT

This chapter examines the transcultural political economy of television-set production as the US and other countries made the transition to the digital television platform. The complexity of technical standards for digital television, the proliferation of free-trade policies, and the globalization of production have reconstituted the context of consumer electronics manufacturing and thus have deeply impacted the making and consumption of TV sets. The chapter will focus on the emerging “Silicon Border” along the US–Mexico divide and on the ways in which labor, trade, and new technologies continue to intersect with the material conditions of race, gender, and immigration in the digital era.

This chapter examines the transcultural political economy of television-set production as the US (and other countries) made the transition to a digital television (DTV) platform. There was a time in the US when multiple stakeholders looked to digital-television production both as a problem and as a solution. In 1989 the US Congress began discussing the emergence of advanced television technologies. At stake, according to congressional leaders, were the national security and the gross national product (GNP), and both were at great risk if the US did not take a lead in the emerging era of digital communications (United States Congress, 1989a, 1989b, 1989c).

During the same period there was a scare, especially among over-the-air broadcasters, that the days of television viewing were numbered. Despite the fact that millions of viewers around the globe still rely on television broadcasts for news, entertainment, and information, industry analysts in the late 1980s predicted that television–Internet convergence, Web–video productions, and consumers spending more time online through computers and mobile devices would kill the television industry. Finally, there was a debate among those in the US consumer electronics industry, which at that point was radically reduced by the influx of foreign manufacturers who were producing their technologies abroad and importing them below the market cost. Given the shifting communications landscape, what could be done to ensure that TV sets would not become extinct in the new era of global information and multimedia platforms?

Congress and the electronics industry answered this question through action. They asserted that consumers would still need accessible electronic devices to stay connected to the airwaves and to steer onto the information superhighway. For elected officials on Capitol Hill, advanced television (which later became known as “high definition television” and, eventually, as DTV) was a solution to how the US was going to maintain and expand its role as a global superpower in an age when high technologies were rapidly transforming political, economic, and cultural landscapes (Castañeda Paredes, 2000, p. 4). At a 1989 Senate hearing on the prospects for the development of a US advanced television industry, both policymakers and corporate owners agreed that

electronics is the infrastructure. It is going to underpin and shape the world’s economy, and potentially its political organizations, in the twenty-first century. It is not just an industrial segment; it is our belief, after much study[,] that [advanced] technologies – not just television – will be at the hub of the information age’s infrastructure. (Castañeda Paredes, 2000, p. 27)

These political statements made it clear that digital television was perceived as a powerful tool that needed to be subjected to state policy, in an effort to exert some level of economic and political influence over its production and dissemination.

Additionally, former *New York Times* reporter Joel Brinkley (1997) suggested that the changeover to DTV would permanently change the way the US and the world utilize television and information technologies. If this was true, then the shift would be historically significant, since TV is, without a doubt, the world’s preeminent leisure-time cultural activity. Some 98% of the American population owns television sets, and over 900 million units are in use around the world (Johnson, 1998). In order for viewers to receive the digital-based broadcast programming, audiences have either to buy new digital television sets (which currently cost between \$250 to \$5,000 and range from low-end to high-end) or to buy converter boxes, which cost from \$40 to over \$80 and deliver a lower grade of services. Despite the seemingly low cost for equipment that is now available, the electronics market for digital television is valued at \$76 billion in the US and at \$335 worldwide (Consumer Electronics Association,

2007–2008). The growing sales point indeed to the huge market restructuring that is currently underway within television equipment, programming, and advertising markets. Furthermore, the Trade Expansion Act of 1962, which reduced tariffs by an additional 50%, set the stage for the movement of capital into Mexico's borderlands, where cheaper labor could be utilized as a competitive tool for reducing production costs and for bolstering profit margins, especially for high-tech electronics (United States Congress, 1962).

Nearly 20 years after these initial fears and predictions, we see that the pervasive use of social networking technologies, of wireless handheld devices, and of digital television clearly points to the power of new information technologies. It confirms, as Dan Schiller (1999) points out, a "new epoch of [. . .] digital capitalism" (p. xiv). The electronics infrastructure of the twenty-first century is not merely a system of technological hardware, but a global network of networks, upon which "the social and cultural range of the capitalist economy" is far more reaching through digital media than ever before (Schiller, 1999, p. xiv). Moreover, Schiller (2009) argues that, despite the pervasiveness of the media, "the existing information society is deeply divided [. . .] marked by increasing economic inequality [. . .] [and shaking the] limited but substantial democratic features and practices" of information provision to their core (p. 147). Thus the sector of communications-based consumer electronics is an important entry point into the digital infrastructure of high-speed telecommunications. This sector is increasingly vital for workers' and citizens' participation in the global economy, but it is often available unequally and undemocratically, as Schiller argues. Given the importance of television within the broader landscape of consumer electronics, this chapter will examine how the complexity of technical standards for DTV, the increase of free-trade policies, and the globalization of production have reconstituted television-set manufacturing. It will also focus on the emerging "Silicon Border" along the US–Mexico divide and the ways in which labor, trade, and new technologies continue to intersect with the material conditions of race, gender, and immigration in the digital era. Ultimately, the chapter aims to demonstrate that digital television-set production is not simply about the making and consumption of TV sets, but, more importantly, about the making of a "new, ruthless economy," which threatens to deepen information and social inequalities (Schiller, 1999, p. 207). It is critical to study this area of media production, since it is a microcosm of the tensions that are unfolding within national and global communications.

In an effort to present such a study, the chapter is divided into four sections. The first section discusses how the historical debates over television technical standards affected the technological development of digital television in the United States. More importantly, the section demonstrates how the process of standards setting and property creation is not simply about adopting the best technology, but about bolstering the political and economic interests of key players. This section is followed by a discussion about the role of free-trade policies and globalization in generating digital-television properties and market demand over the concerns and organized resistance of labor. The third section examines the role of the *maquiladora* system along the

US–Mexico border in the manufacture of digital television and its enduring importance as a global trade platform. Finally, the chapter investigates the ramifications of high-tech manufacturing for workers – especially for young Mexican women, who constitute the majority of the labor force in consumer electronics factories located south of the border. Ultimately, the chapter aims to demonstrate how television-set production in the era of DTV entails more than simply producing digitized audiovisual equipment: the manufacturing of high technology requires an intense political and economic effort, which has real implications for people and culture.

Setting the Standard for Digital Television

In 1996, after a decade of congressional hearings and industry analyses, the Federal Communications Commission (FCC) adopted the broadcast Advanced Television System Committee’s “digital television standards” and consequently unleashed a new era of television in the US. The road to broadcast DTV, however, was not easy. In fact it was fraught with competing notions of what the future of high-tech television should be based upon. At the core of the debate was the ideological shift toward expanding market and consumer-driven approaches not only to telecommunication policies, but to social, educational, and healthcare policies as well. The FCC’s decision to adopt a dual scanning mode in the new broadcast standard and thus to do away with analog transmissions set the stage for members of the National Association of Broadcasters and of station affiliates (who preferred the interlaced scanning of traditional TV sets) and for representatives of computer interests (who preferred the progressive scanning of computer monitors) to compete in the marketplace – where consumers, not government, would select the best model for receiving DTV signals.

Such competition, argued high-tech companies like Apple, IBM, and Microsoft, in fact helped create a thriving retail computer industry in the US. This preference for a “market-driven selection” also corresponded with the FCC’s decision to exclude technical stipulations for video-receiver resolution. That is, the market, rather than the Commission, would determine whether high definition, standard definition, or a hybrid TV model would succeed as the dominant format in receiver equipment. Presently, consumer dollars have largely been spent on high-definition PC hybrid widescreen models that include either interlaced or progressive scanning; but, as media reports have noted, there is still much confusion from consumers as to what the extra cash spent on hybridity is really buying (Deame, 2001).

To understand the process for establishing DTV standards in the 1990s, it is important to examine, first, the agenda for setting color-TV standards in the 1950s. Although this earlier battle occurred on the global stage, the two political processes shared the logic by which technical standards should drive the consumer TV market (Crane, 1979, p. 11). At that time three main global competitors were seeking approval from the FCC for their color TV standard: NTSC, PAL, and SECAM.¹ Citing public and

corporate investments, the FCC selected the NTSC standard for color TV, even though engineers regarded that standard as somewhat inferior (Kittross, 1979, p. 265). After some hemming and hawing, the FCC claimed that it wanted to keep the standard within the US framework in order not to disrupt the well-established broadcast television infrastructure (Armstrong, 2007, p. 133). With this decision, color TV materialized. Over time black-and-white television sets were phased out, as the market demand for color-based equipment grew.

In many ways, the same logic was utilized in DTV because it was assumed that market demand would select the best TV electronics. The difference lies in the fact that there were only three global standards to select from in early television, whereas in digital television there were six major technical standards in the US alone. The rise in advanced communication technologies and the venues for accessing convergent information thus shifted the paradigm toward the adoption of multiple standards for digital television. This was an important issue for the various players involved in the development of DTV standards. The tensions regarding the future of broadcast media were evidenced by the background of the invited members of the Advisory Committee on Advanced Television System, the organization responsible for developing what would eventually become the ATSC (Advanced Television Systems Committee) standards for digital television. This committee was dominated by interests in telecommunications, satellite broadcasting, cable television, consumer electronics, and content programming, and it largely included technical experts in multimedia and computers (Wu, Hirakawa, Reimers, & Whitaker, 2006, p. 15).

Ultimately, after years of government hearings, technical studies, and industry debates, concessions were made between broadcast and computer interests. Larry Irving, former assistant secretary of the National Information and Telecommunications Administration, summed it best: at stake here were more than concerns over broadcast television – it was the “future American economy in terms of manufacturing, trade, technological development, job growth and international investment” – fields that were increasingly intertwined with the future of telecommunications and new media (National Telecommunications and Information Administration, 1996, p. 1). In the communications area of consumer electronics, the promotion of a competitive marketplace was therefore viewed as paramount – and viewed so to a higher degree than supporting a limited standardized system for broadcast equipment was, since the former also underpins local, national, and international communications and economic transactions. In some ways, there was a notion that adopting the broadest set of technical standards would allow the state and market to “adapt to the realities of informational power,” which would certainly emerge in the future, although they were unidentifiable at the time (Braman, 2004, p. 161).

The technical DTV broadcast statutes adopted by the FCC were recognized as the starting point for impacting related sectors such as equipment manufacturing, the retail and mass marketing of receiver sets, and the logical commercial development of the new system. The billions of dollars poured into the transition indeed demonstrate that the standards-setting process, with its risks, conflicts, cooperation, and

accommodation, constituted a central component of “wealth creation”; and, as the world achieved greater economic and cultural connectivity, standards have gained greater significance (David & Steinmueller, 1996, p. 820). “Technical standards clearly do not flow ‘neutrally’ from some fountain of best engineering practice, but, rather, they reflect the full range of strategic behaviours that are seen in other economic activities affecting technology and market formation” (ibid., p. 829).

Yet the rise of the computer industry and its looming convergence not only with television equipment but also with television content and business practices made it necessary to adopt DTV standards that would be flexible and adaptable to the shifting political-economic context of new media equipment. As Schiller (1999) noted in *Digital Capitalism: Networking the Global Market System*, “at stake in this unprecedented transition to neoliberal or market-driven telecommunications is nothing less than the production base and the control structure of an emerging digital capitalism” (p. 37). In other words, this historical moment demonstrates an even greater affinity of media policymakers with the unbridled economic approach to global information infrastructure. Yet it is also important to note that the market orientation toward the emerging media technologies is not occurring in a regulatory vacuum, devoid of government intervention. In fact, as in previous media histories, the property creation of new communication industries is rooted in “designing government policy for business that encourages marketplace competition” (Streeter, 1996, p. 167). Some level of state arbitration was necessary in order to provide nominal order toward the property creation of DTV. Permitting a full-fledged, unfettered marketplace of standards would have created too many unknowns and conditions that may have impacted national security and the communications industries negatively.

I have noted in an earlier article (Castañeda, 2007) that the adoption of multiple technical standards greatly stifled the manufacturers’ ability to produce an economy of scale for television receiver sets, since the economies of scope for digital television varied too widely among multiple standards (p. 92). It was not until most recently that the TV manufacturing industry adopted an integrated-standards approach, which allowed consumers to purchase a television set that included both interlaced and progressive scanning with 720 or 1080 pixel lines, rather than separate TV consoles with discrete standards. Hence manufacturers have made peace with the fact the FCC approved multiple standards by reaching a point in the creation of DTV in which television sets simply include all or most of the standards. Despite this shift, there is still much confusion from consumers (and from some retail sales associates) over the availability of multiple DTV formats – which include varieties between plasma, flat screen, and Internet-ready options. This state of things has induced, in consumers, a permanent cautiousness and an unwillingness to purchase a new television set unless it’s absolutely necessary to do so (W. Santos, personal communication, July 15, 2008). The ripple effect caused by the lackluster consumer appetite for DTV equipment as well as by the broadcasters’ protracted installment of new digital, high-definition production technologies has tempered the “initial” excitement over DTV,

thus creating a context in which the official DTV transition deadline has had to be pushed back several times (García Leiva & Starks, 2009). It has taken over a decade for consumers to endorse the switchover to digital television, largely because the complexity and confusion over different standards stifled the ability to build consumer confidence in the new media product (W. Santos, personal communication, July 15, 2008).

The gradual start of DTV demonstrates that the importance of technical standards cannot be underestimated, since they set the technological context through which the manufacturing, distribution, and consumption of equipment can take place. According to Roy Rada (1993), standards are the language of success through which business can communicate with a certain degree of certainty. With a variety of standards, there was concern that it would be difficult to discern which DTV formats would be successful and which would not. As the section above demonstrates, the current era of digital capitalism is not merely the result of technical ingenuity, but also of specific policymaking aimed at media property creation; standards-setting was one area of such policymaking. Free-trade policies constituted another area, which the next section discusses.

Creating the Market for DTV while Taming Production Labor

The emergence of digital (high-definition) television in the mid-1990s was perceived by some US trade officials as an opportunity for the US to regain its position as a global powerhouse in consumer electronics. After nearly 50 years of television set production, the US had lost its dominance as a lead producer. As early as 1966, the Radio Corporation of America (RCA) responded to the competitive threat of foreign consumer electronics companies by moving television production to Mexico, thus taking advantage of the Mexican government's implementation of a border-based manufacturing program the previous year (Cowie, 1999, p. 71). The large labor force readily available in Mexico, the onslaught of foreign television commodities from Asia, and the fomenting anti-union sentiment in the US led to the migration of most American TV manufacturers by the late 1960s and 1970s. Consequently, in the post-Fordist transition, manufacturers relocated all or large parts of their manufacturing to developing countries, in a quest for cheap labor and in an attempt to circumvent the negative effects of "overproduction, price erosion and fierce competition" (Cowie, 1999, p. 148).² Some believed that the emerging DTV market could potentially reverse this downward spiral of off-shore production, which had begun decades earlier. They were wrong.

As shown in the previous section, the ideology of free trade and open markets was an integral part of the discussion about the development and transition to DTV since its beginnings. This new technology embodied a pivotal change, which started

70 years earlier, toward the transnationalization of communications market relations, the expansion of US trade interests, and electronics corporations' growing stake in overseas markets. Information policy expert William J. Drake notes:

Global liberalization over the past decade has radically increased the number and diversity of stakeholders, as new service suppliers, manufacturers, and corporate users vie to interwork a multitude of components and networks into a heterogeneous information fabric that is increasingly geared toward the demands of transnational corporations. (Drake, 1993, p. 271)

Indeed, as noted by former US Secretary of State Warren Christopher during a 1995 hearing with the Senate Foreign Operations Subcommittee, communication systems are critical for regional and international trade, since they create a context for open societies, and thus for open markets and for positive geopolitical relations.

Aside from and prior to this political equation between free trade and open societies, it was the US interest in "open markets" via multilateral trade policies in the 1960s/1970s that was equally responsible for the shrinking market share of US consumer electronics and for the successful implementation of off-shore manufacturing. US tariff laws such as the Trade Expansion Act of 1962 assisted the migration of companies, because they stipulated that products processed or assembled with exported US materials would only be taxed on the value added abroad once the finished products were imported back to the US. This meant that TV manufacturers would be taxed solely for labor costs (the value added), but not for the exported materials that were initially used to build the TV sets. Thus the reduction of tariffs on electronics manufacturing helped create the context that later envisioned digital television as the redeemer of US technology industries.

In the early 1970s electronics unions foresaw the impact that open market regulation would have on employment opportunities and on the potential domination of foreign countries through "product dumping" (Helleiner, 1977, p. 109). As a result, unions aimed to demonstrate the shortsightedness of multilateral free-trade agreements by petitioning against them and by using scare tactics regarding national security. According to an article by Victor Canto (1983/4) in the libertarian *Cato Journal*, the workers' calls for a protectionist policy came in response to the growing fear that US products were losing their international competitiveness in the wake of open markets. Yet such markets were encouraged by government trade officials, who at the time viewed restrictions as potentially "counterproductive, impoverishing domestic and foreign producers and consumers alike" (Canto, 1983/4, p. 683). Ultimately this trade scenario did not take pay heed to workers; but they did not go away quietly.

The 1971 tariff petition filed for instance by the International Union of Electrical Radio and Machine Workers in the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) claims that the RCA plant in Memphis, Tennessee shut down because of "concessions granted" to RCA by the Trade Expansion Act of

1962 – a federal legislative act that promoted reduced tariffs for bi-national and cross-border manufacturing (United States Tariff Commission, 1971a, p. 1). The petitions from former workers at RCA – as well as at Emerson Television and Radio Company in New Jersey, at Zenith Corporation in Illinois, and at Television Manufacturers of America Company in Illinois – to the FCC were attempts to link the expansion of open trade policies with falling rates of employment in US television electronics manufacturing (United States Tariff Commission, 1971b, 1971c, 1971d, 1971e). They charged that the government was not creating policy in the best interest of American workers.

The state sided with business interests. In response to all four petitions, the FCC ruled “no finding” within its final report of November 1971 and maintained that the Trade Expansion Act of 1962 did not “cause, or threaten to cause, the unemployment, or underemployment, of a significant number or proportion of the workers” at television-related plants (United States Tariff Commission, 1971f, p. 3). The American Electronics Associations (AEA) concurred with the FCC, and it also argued that US trade policies were not the problem. According to AEA, the downturn of US consumer electronics was in part the result of Japan’s lack of reciprocity for an “open” television market; this was best illustrated by the government’s high import tariffs, which prohibited non-Japanese consumer electronic corporations from entering Japan’s domestic television equipment market (United States Congress, 1989b). Although this was not entirely explicit, there was also a level of Asian xenophobia that influenced the negatively perceived presence of Japanese products and manufacturers (Hiraoka, 1989; Nelson, 2005).

The 20 years of free-trade policies and legislation that encouraged off-shore manufacturing in consumer electronics produced the landscape in which the US was no longer competitive in high technology manufacturing. According to Jeffery Hart in his book *The Politics of HDTV in the United States*,

[the] relative decline of US competitiveness in world trade [. . .] came as a shock to the United States. The heightened dependence on the imports from Japan of electronic components for both civilian and military production figured in a major debate inside the Department of Defense [by] the mid-1980s and later in the Congress about how to reduce dependence or to counter its possible effects. (Hart, 1992, pp. 1–2)

It was the fear of foreign dependence in an increasingly high-tech world and the prospect of reigniting the US consumer electronics industry that spurred Congress into action to support the development of DTV, despite the fact that the US government had created this difficult situation in the first place.

Nearly two decades after the electronic unions warned the FCC and the Congress against the negative effects that unfettered trade expansion would have on consumer electronics, at a 1989 hearing, the American Electronics Association requested that Congress support and jump-start a program that would foster “the beginnings of a US [advanced television] industry” (United States Congress, p. 46). Democratic Party

senators at the time, such as John Glenn and Albert Gore, Jr., responded to the perceived threat of electronics multinationals from overseas with battle cries for federal-government intervention and for the active conservation of “the nation’s future balance of trade” (ibid., p. 3). In a separate hearing in 1989, Senator Glenn further argued: “This debate is absolutely critical [. . .] I am very concerned about the role of our electronics industry in developing HDTV, which means to me more than just household television sets” (ibid., p. 3). Given the significance of high-volume components in the aggregate-electronics market, the industrial control over the design and manufacture of these underlying technologies became the crux of advanced television-policy agendas around the globe.

The belief in the centrality of communications in the global economy was still evident two decades later, at the May 2009 Consumer Electronics Association (CEA) Washington Forum, where the main focus of the event continued to be the role of free trade and of technology policy in the transition to digital television. Republican US Representative Roy Blunt from Missouri was especially fêted for his impassioned advocacy of digital television and free trade. During the Washington, DC forum, the president of CEA, Gary Shapiro, remarked: “We honor Rep. Blunt for reaching across the aisle to build bi-partisan support for the Columbia Free Trade Agreement and for his leadership on DTV” (Consumer Electronics Association, 2009, p. 1). Fifteen years after the North American Free Trade Agreement (NAFTA) and after FCC’s support of advanced television standards, the CEA still touts all free-trade agreements as key components for the future success of digital consumer electronics. This is not surprising, since the CEA is the US representative to the global consumer electronics industry, and one of the tenets of its mission is to ensure the prominence of US electronics in worldwide trade. At the start of 2009, the CEA noted that its four main foci for the next few years were going to be green technologies, free trade, broadband access, and the changeover to digital television (ibid.). This emphasis is logical, given the convergence between digital electronics, the expansion of the Internet as a site of economic production, and the \$1.4 trillion produced each year by the US consumer electronics industry (Gross, 2008; Park & Roome, 2002). The proliferation of free-trade policies has thus recast DTV: it is not only about television sets, it encompasses the future market expansion of the communications–information sector on a global scale.

Indeed all the mania of living in an information society is impacting the production of electronic equipment that is needed in order for the millions of informational terabytes to be accessible in the digital age. Since technology must be built at a faster rate and lower cost in order to justify the investments made in advanced systems, the production of digital technologies is largely taking place outside the US. Although this is not new, the digitalization of consumer electronics has intensified the globalization of production. Concurrently, the global economic crisis has forced corporations to rethink their off-shore production strategies, and the manufacturing processes available just south of the US border, through the *maquiladora* system, continue to be a prime framework for accessible, low-cost production in a transborder environ-

ment with favorable trade conditions. Similar manufacturing arrangements (production of the *maquila* type) are also emerging across Latin America; but, more importantly, what the *maquiladora* system offers to “US, European and Asian capital [are] the advantages of free entry into several South American countries due to [their] bilateral trade agreements (Gerber & San Diego Dialogue Program, 1999, p. 7). At a moment when markets across the Americas are in need of millions of advanced television sets for the ongoing transition to DTV, the manufacturing of TV equipment along the US–Mexico border provides a cheap and expedient production of electronic goods, as well as trade access. It is important to examine at whose expense and under what conditions the production of digital television sets is taking place. The next section will explore this issue further.

DTV Set Production at the US–Mexico Border

There is a long history of mass media and television-set production at the US–Mexico border (Fox, 1999). Foreign outsourcing proved to be an effective method of countering the onslaught of competition, which was inadvertently brought about by international patent licensing. Sales of television sets made in the US began to decline as intense foreign competition chipped away at market share, which set in motion a historical transformation of the US television industry – from national production to a transnational, border-based export platform model. The *maquiladora* model, used originally for automobile and textile commodities, created a context in which similar transborder manufacturing methods were utilized for communication technologies such as television and radio sets, as well as for silicon-based high-end technologies such as computers.

In explaining how the political economy of set production was unique to Mexico, Nichola Lowe and Martin Kenney (1999) compare their platform model with that of Taiwan, which was also developing in East Asia about the same time. In Taiwan, Japanese investors developed joint manufacturing and communications efforts in the country’s free-trade zones, and, as a result, they improved their “access to the highly protected Taiwanese consumer [and components] market” (Lowe & Kenney 1999, pp. 1428–1429). In Mexico, on the other hand, the *maquiladora* system was simply regarded as an advantageous tool for exploiting lower labor costs, and “foreign investors had little interest in growing consumer base in Mexico. Rather, they were focused on the single goal of surviving in the US market” (ibid., p. 1435). Lowe and Kenney argue that the different approaches and perceptions of foreign investors essentially solidified Mexico’s failure to develop an “indigenous” and self-sustaining consumer electronics industry, while the island of Taiwan experienced a successful “expansion of foreign exchange, employment and development of assembler–supplier relations” (Lowe & Kenney, 2000, p. 49). In the Mexican-border context, trade policies and investor preferences for specific market share created a different

manufacturing industry in Mexico, and by extension in Latin America, from the one they created in Taiwan, and by extension in Asia. The outcome of those differences is more striking today, as Asia recovers more quickly than Latin America from the global economic crisis of 2008–2009.³

As Silicon Valley in Northern California became the epitome of industrial design and of high-tech ingenuity, the Silicon Border became its mirror image for industrial manufacturing. Located just over the US–Mexico border, in Mexicali (which lies opposite Calexico in California), the manufacturing complex known as “Silicon Border, Science Park of the Americas” embodies fast and cheap production in the digital age (Dickerson, 2008). Officially announced in 2004, the “Silicon Border” park was intended to become the premier site for semiconductor production in North America. Since all media and information technologies, large and small, are dependent on silicon chips for their operation, the investors in the 10,000-acre industrial complex believed that the development would produce jobs and less dependence on foreign companies, especially Asian. According to the chairman of Silicon Border D. J. Hill, not only will the industrial park provide 100,000 jobs to Mexicans and US workers located at the Mexicali–Calexico border, but, more importantly, national security will be protected for both countries. Hill stated: “By making a place in North America, we have from a security standpoint an alternative place for manufacturing [. . .] because if Taiwan unifies with China, the advanced manufacturing will be controlled by a communist country” (Pisor, 2005). The mounting concern over dependency and the rising costs of the overseas supply chains instigated the need to rethink the importation of high-tech goods from Asia.

The digitalization of television production has not only led to the demise of traditional TV sets, which used cathode-ray tubes; it has also influenced factory production methods. Although initially consumers were lukewarm toward DTV, the firm 2010 congressional deadline for the digital switchover finally spurred the consumer demand for flat-screen, computer-friendly TV sets. Not surprisingly, the high demand has also caused price wars and a rapid fall in the prices of multi-standard flat-screen panel TV sets (Taub, 2006). This market situation caused manufacturers to rethink their production and inventory strategies. For instance TCL-Thomson Electronics, the world’s largest TV maker, noted that it takes 90 days to manufacture and ship a conventional TV set to the US, but that, in order to remain competitively viable, the company wants to shorten the production time to less than 30 days, and also to shorten the travel time to the US (*Economist*, 2006). Historically, it has taken 20 days for a TV-sized consumer electronic product to cross the Pacific Ocean. A TCL-Thomson Electronics manufacturing plant located at the Silicon Border, however, cuts those production and travel phases in half or less. Sony Electronics Corporation actually employed this model for years, through its design and manufacturing centers in San Diego, Tijuana, and Mexicali (Castañeda Paredes, 2003). Consequently, the current global economic crisis has reinvigorated Mexican high-tech centers like the Silicon Border as economically efficient manufacturing sites, especially for North American markets. The recent adoption of green technology in the industrial

park has also transformed the Silicon Border into a prime site for advanced manufacturing. According to Dickerson (2008), the greening of transborder production offers a number of advantages, such as lower operating costs, tax preferences under NAFTA, and closer proximity to potential customers in the US and in its global trading partners.

It is important to note that Silicon Border is not working in isolation but is part of a larger landscape of industrial parks that exist along the US–Mexico border and the Mexican Gulf Coast, all of which serve the continent’s digital electronics market. Such a vast market also necessitates an extensive labor force. The next section will therefore discuss the issues that arise when racialized labor, uneven trade flows, and new technologies intersect at the point of production in the digital era.

The Ramifications of High-Tech Manufacturing

The current drive for the mass production of high-tech electronics is creating an array of outcomes for workers, the two most important areas where this happens being health and environment. In the last five years, various film and online documentaries have portrayed and given voice to the uneven consequences of environmental and labor practices within the broader field of consumer electronics production and to the emotional toll of the geopolitics between the US and Mexico.⁴ In *Maquilapolis: City of Factories* (2006), filmmakers Vicky Funari and Sergio de la Torre tell the stories of *maquila* workers, particularly Carmen Duran and Lourdes Lujan, two women who work for Sanyo Electric Co., one of the largest television-set producers in the world. The film traces the harsh effects that the *maquiladora* industry has on its workers, as well as these women’s families and communities. The documentary follows Duran and Lujan: they earn between \$6 to \$11 a day, which is higher than the typical \$3–\$5 factory wages, but they are exposed to deplorable working conditions, managerial intimidation, and taxing health problems caused by environmental toxins. The documentary ends with Duran and Lujan winning a legal battle in which Sanyo is forced to pay severance monies to its workers, and Sanyo decides to relocate its Tijuana-based manufacturing unit to East Asia – specifically, to Taiwan.

Just as postcolonial models continue to exist in relation to transborder manufacturing, the material conditions of race, gender, and immigration in the digital era are present. In fact these issues are becoming more important than ever, as women from historically exploited ethnic and class backgrounds continue to constitute an important workforce in the electronics industry not only in Latin America, but in Asia as well.⁵ For instance, in Mexico, women largely between the ages of 18 and 30 constitute more than half of the *maquila* workforce (Comité Fronterizos de Obreros, 2007; Vásquez Ruiz, 2007). This proportion actually represents a drop in the number of female *maquiladora* workers, since the notion of “cheap, docile, and female” is not necessarily a given: more women organize around labor issues (Peña, 1993). Despite

such organizing, and despite the fact that factories were hiring more men in the 1990s, the “maquila-grade female” was still the aspired standard worker (Salzinger, 2004, p. 56). The physical, emotional, and social toll of factory work on these women cannot be underestimated.

In a report to the Comisión Económica para América Latina y el Caribe (CEPAL), Schatan and Castilleja (2005) argued that, because the electronics assembly industry in Mexico was established under vulnerable environmental conditions, both the workers’ and the community’s health were affected by electronics-based *maquiladoras*’ use of toxic substances and by their noncompliance with environmental standards for high-tech manufacturing. The study also demonstrated that the push for unfettered production and trade was deeply impacting the weakest sector of the labor force, which consisted largely of young women. According to journalist Elizabeth Grossman (2006), women and men who work in *maquiladoras* are exposed to a daunting amount of air- and water-borne pollutants, as well as to a plethora of chemicals that can cause severe health issues, such as kidney failure. Lead, for example, is utilized in the production of television and computer screens, yet it is highly toxic for the nervous system and especially dangerous for children. The often substandard working conditions of *maquila* assembly lines fail to protect workers and their families and increase the chances that they will suffer from a slew of health complaints such as chest pain, upper airway irritation, sore throats, excessive mucus, rashes, headaches, dizziness, memory loss, depression, and hair loss. Breast cancer has been on the rise from exposure to and inadequate disposal of hazardous materials. Individuals working on the *maquila* production floors have increased chances that their children will suffer major “birth defects [. . .] ranging from limb deformities to anencephaly” (Kourous, 1998, p. 2). Add to this the outbreaks in food poisoning that workers at both Philips and RCA television *maquila* plants in Tijuana suffered, and one would conclude that *maquiladoras* are not safe environments.

Furthermore, the repetitive work exerts its own tolls. Informatics-based labor produces eye, wrist, and back aches. The work conditions are no different from “swift sewing in garment factories,” in that high-tech surveillance, which is in place in this context, “docks workers for slowness and typos, and pushes them to faster and more punctilious work” (Nathan, 2000). Despite the belief that advanced technologies have the potential to level the playing field, the digital era has not eradicated social inequities, but in fact has exacerbated the negative dynamics that maintain the status quo.

The impact of *maquiladoras* is transnational, a fact that most US consumers rarely consider. The City of Industry in California, for instance, boasts the largest array of *maquiladora* twin-sister plants, located just 150 miles north of the US–Mexico border. These plants are the final processing centers for *maquiladora*-produced electronics and other commodities certified as “made in the USA.” A brief interview-based study of the workers, which I conducted with City of Industry workers from 2005 to 2007, showed that 70% of the workers in my sample were largely Mexican immigrants and

nearly 80% were women. Although the final processing plants were in the US, the treatment of workers was still problematic, even if it was better than in the sister *maquiladora* plants in Mexico. Women workers reported indirect pressures on the job, such as passive-aggressive “jokes” about their employment future, and low-grade health difficulties that they soothed by drinking alcoholic beverages after work.

In fact, Sarah Hill (2001) argues that neoliberal policies have often produced a discursive legitimacy toward the physical hardships experienced by people working in environmentally poor conditions. As Hill notes, “First World anxiety about rainforest depletion has not always worked in the service of the indigenous people who live there” (p. 158). Environmental health effects, nevertheless, are uneven between the producing and the receiving countries. The level of impact of hazardous waste on workers varies according to where they are located on the production divide. Manufacturing countries like Mexico will continue to experience the negative consequences of high-tech manufacturing, by comparison with consuming countries like the US. Digital technologies and Internet access may increasingly be viewed as the great equalizers; but, when one examines the global manufacturing marketplace, it is apparent that long-standing imbalances of structural power continue to exist. In this sense, the digitalization of television is not only changing the rates and kinds of human impacts, but also exacerbating the differences between countries.

Although the film *Maquilaopolis* (*City of Factories*) reaches the conclusion that US *maquilas* will leave Mexico, Sanyo kept a border presence via its corporate partnerships with other telecommunications and electronics producers, which sold approximately one million liquid-crystal display (LCD) TVs in North America alone (Nikkei Weekly, 2008). The cyclical flows of operating expenses – such as rising material, transportation and labor costs in Asia, and the largess of the Americas’ continental market – are critical reasons why corporations like Sanyo did not fully abandon the *maquila* manufacturing system. For instance, Sanyo plans to triple its North American sales of “electronic products,” including digital television sets, by the end of the fiscal year 2011, even if the production of more electronics also generates more electronic waste and toxins (Kane, 2008, p. B6). At the same time, these women may be the source of resistance in the future. According to Betty Robles from the Mexican Maquila Women Workers Network:

We can’t pretend that women and men are the same. It’s the women who get up at 4:00 or 5:00 a.m. to get the food prepared. It’s the women who are forced to show their soiled sanitary pad to prove they aren’t pregnant. It’s the women who have to fight off sexual advances. It’s the women who have to keep the family together and are leading the fight for healthy communities. (Maquiladora Solidarity Network, 1995, “Creating a New Workforce,” para. 1)

This is clearly demonstrated by the increased participation of women in Latin American social movements and in transnational organizations such as the Coalition

for Justice in the Maquiladoras, which aim to support workers' rights and community struggles, but especially to "place special emphasis on defending the rights of women who suffer discrimination, humiliation, and sexual harassment in the workplace" (Coalition for Justice in the Maquiladoras, 2008, para. 1).

Conclusion

Television-set production in the digital era (and consumer electronics more generally) is an elaborate tale of how political, economic, and cultural forces have transformed (albeit unevenly) the communications industry into a prime site for digital capitalism. Although the switch to digital is often discussed as merely existing at the level of policymakers and consumers, it is irresponsible to not understand how the DTV transition will impact television-set production and workers at the forefront of those assembly lines. The movement to digital television and to information technology convergence has only just begun, and it is safe to forecast that the issues discussed in this chapter will not be resolved any time soon. However, as consumers of new technologies and as global citizens interested in social progress, it is imperative that we understand the production origins and the workforce context of the high-tech consumer equipment we consume everyday. Perhaps this will foster the recognition that the United States does not operate in a vacuum and that the anti-Latino immigrant-policy actions (which regard especially those of Mexican descent) are a performance that aims to suppress the reality of the enormous dependence of the US on Latin American and Latino labor, even now in the digital era.

Mayer's (2009, p. 16) analysis of digital television-set manufacturing in Manaus, Brazil, for instance, uncovers another site where global production, communication policy, and flexible labor "will likely accelerate the pre-existing trends that promote inequalities in industrial manufacturing zones, including increased stratification between the upper and lower ends of the social hierarchy as well as the isolation of managerial and technical classes in the zone from other elites." She concludes: "Without a policy process that considers social inequalities in production locales, digital television instead may mean just another technology on the assembly line."

Ironically, the transition to DTV is perplexing and causes anxiety to many consumers because the technology is such a deep financial investment on a personal scale. Yet there is a broader political-economic landscape, which is shaping that investment in ways that consumers, policymakers, or even the TV-set makers themselves cannot even begin to imagine (Galperin, 1999). The re-tooling of audiovisual industries already underway has made many aspects of the production process unpredictable, and yet the location of these processes in Latin America, and in Mexico in particular, seems certain to continue (Galperin, 2006). The global production of television sets and of consumer electronics has been characterized by intensified scales and by geographic dispersals, particularly to China and other Asian countries. While China

may now be the leading producer of manufactured goods, and Asia as a whole may be the economists' "bright star" on the road to recovery from the recent 2008–2009 recession, the North American continent continues to look to Latin America for low-cost labor in order to satisfy its consumer markets (Burgess, 2010; National Intelligence Council, 2007).⁶ According to the US National Intelligence Council (2007), low labor costs, especially along the manufacturing zones at the border, sustain a context that, for all practical purposes, has integrated the northern states of Mexico into the US economy. In other words Mexico, and Latin America more generally, will remain strategic partners in the US and media industries' future economic growth. This chapter's historical analysis of the policy, economic, and employment practices of television manufacturing at the US–Mexico border demonstrates that the regional logic of *maquiladoras* will continue to be relevant in the new era of digital media, because *maquiladoras* provide the nuts and bolts of cheap labor, accessible transborder pathways, and a trade regime that benefits foreign investors. How exactly this future will be reconciled with the other ongoing border problems, such as unhealthy and exploitative labor conditions, political corruption, immigration flows, and narcotics-related violence, remains to be seen.

NOTES

- 1 NTSC (National Television System Committee) is used in North America and Japan. PAL (Phase Alternation by Line) is used in Western Europe. SECAM (Séquentiel couleur à mémoire) is used in France, Eastern Europe, and the Middle East (Crane, 1979, p. 11).
- 2 Jefferson Cowie's (1999) study of RCA's (Radio Corporation of America) manufacturing relocations from Camden, New Jersey to Bloomington, Indiana, then to Memphis, Tennessee, and ultimately to Tijuana, Baja California, Mexico makes evident that the sad state of consumer electronics in the US was the result of a 70-year quest to escalate profits while lowering production costs – at all costs.
- 3 The global economic crisis of 2008–2009 is described by Cao et al. (2010) as the period in which the near collapse of the global financial systems is the largest economic shock to occur in 80 years (p. 12).
- 4 Border Film Project (2010) and Ojeda (2006) are two noteworthy examples of how activists utilize media outlets to show the inequities of the global manufacturing marketplace.
- 5 Safa (1981) and Sassen-Koob (1984) were some of the first to critically examine the links, especially in developing countries, between transnational production, labor, and women and to historicize the use of female workers as cheap labor. Since then, feminist scholarship has continued to investigate those links (see Fernández-Kelly, 2008; Fussell, 2000; McLaughlin & Johnson, 2007; Ong, 1991; Rios, 1990).
- 6 At last tally, Mexico continues to have the lowest hourly compensation costs at \$3.91 an hour, compared to Canada's and United States' average of over \$30 an hour (Manning & Butera, 2000, p. 194).

Citizenship and Media Ownership

John McMurria

ABSTRACT

For the practice and study of media production, ownership matters. This chapter considers three orientations to media ownership in the US, with attention to how each invokes particular rationales for citizenship. The first orientation considers the critique of media conglomeration that emerged in the 1980s and the anti-corporate populist expressions of citizenship that have informed recent campaigns to reduce corporate media power. The second considers positions that perceive a potential for new interactive digital technologies to free individuals from corporate and government power. The third assesses the movement, since the 1970s, to increase minority ownership of media. Here access to media ownership is framed within conceptions of citizenship informed by past and present conditions of racial discrimination. In each of these orientations, consideration is given to how ideas about the transformative power of media in democratic societies engage with political and cultural struggles over rationales of citizenship.

A common concern in the vast literature on media ownership is whether media facilitate democratic deliberation and promote diverse viewpoints and cultural expressions (Rice, 2008). Some have argued that the growth of large media conglomerates has decreased competition and delimited diversity, while others have suggested that this is not the case, because a proliferation of new media outlets through cable

television and the Internet has decentralized distribution. Often democratic deliberation is understood as a normative goal, and positions on ownership differ according to how diversity is defined and measured.¹ Recent critical work on media and cultural citizenship understands ideas about democratic deliberation to be dynamic and constituted through broader economic, social, and cultural relations.² From this latter perspective, the study of media ownership is not restricted to measuring the impact of media ownership on content diversity. Rather, deliberations on media ownership are considered as sites of contestation over the contours of citizenship more broadly.

This essay assesses three orientations to media ownership in the US with attention to how each invokes particular rationales for citizenship. The first orientation is the critique of media conglomeration that emerged in the 1980s and the anti-corporate populist expressions of citizenship that have informed recent campaigns to reduce the power of corporate media. The second is toward perceptions that new interactive digital technologies have the potential to free individuals from corporate and government power. Though varied and ranging from libertarian to “commons” approaches, these Internet-centered perspectives share expressions of citizenship focused on eighteenth-century concepts of individual liberty. Lastly I consider the movement, since the 1970s, to increase minority ownership of media. Here access to media ownership is framed within conceptions of citizenship informed by past and present conditions of racial discrimination. In each of these orientations consideration is given to how ideas about the transformative power of media in democratic societies engage with political and cultural struggles over rationales for citizenship.

The concept of citizenship has gained renewed interest as a contested terrain for defining boundaries of inclusion and exclusion across the social and cultural registers of class, gender, sexuality, race, and nation (Miller, 1998; Singh, 2004; Lister, 2003). Citizenship specifies the rights and obligations that formally define a person’s legal status as member of a democratic community (Turner, 2001). The parameters of rights have been understood as ranging from eighteenth-century conceptions of “civil rights” that prioritize individual liberty from state power, including the rights to speech, thought, faith, property, and due process, to the more expansive “social rights” of the twentieth-century social welfare state, which include the rights to economic security, health, education, and cultural recognition. Eighteenth-century concepts of civil rights are founded on classical liberal ideas of the individual as autonomous and self-actualizing, and they define freedom in negative terms, as the individual’s freedom from government interference or coercion. Twentieth-century concepts of social rights derive from understandings that economic, social, and cultural relations create unequal conditions for full democratic participation, conditions that require positive action through the redistributive authority of the state (Marshall, 1950).

Citizen rights are tied to certain obligations, which define particular moral and cultural rationales for proper conduct (Lister, 2003, pp. 13–42). Critical approaches to these rationales for conduct consider the ways in which they discriminate or exclude across registers of cultural difference (Miller, 1993). Recent historical

transformations have given the concept of citizenship exigency. A neoliberal political movement has narrowed the scope of social rights since the 1970s by promoting free-market ideologies, dismantling the social welfare state, and promoting personal responsibility and volunteerism in order to solve social problems (Duggan, 2003; Harvey, 2005). Also, an increasing transnational integration of national economies and of frequent movements of peoples across borders has prompted contestations over citizenship and new cultural parameters for belonging and exclusion (Benhabib, 2004; Lister, 2003, pp. 1–3).

In considering the three orientations to media ownership in the US, attention is placed on how conceptions of citizenship in each orientation articulate with the neoliberal movement and with the politics of recognizing cultural difference. Regarding anti-corporate populist critiques of media conglomeration, I consider the writings of Ben Bagdikian and Robert McChesney as political protests against the ideologies of neoliberal policies, which they consider to have widened social and economic disparities. But, in their populist expressions, they subordinate the cultural politics of difference to a broader critique of corporate power and, in McChesney's case, they obfuscate our understandings of how cultural politics has informed past and present media reform movements. In the case of Internet-centered approaches to media ownership, I consider how commitments to eighteenth-century notions of individual liberty have animated sentiments to protect an open Internet from government and corporate power. Yet these concepts of individual liberty invoke a narrow range of rights, which diminish the redistributive scope of government – which has, historically, secured social rights – even as “commons” approaches have constructed collective conceptions of intellectual property and have challenged corporate power. Further, Internet-centered articulations of citizenship as individual liberty emphasize a classical liberal conception of the individual that elides the cultural politics of difference across social formations of class, race, gender, and nation. Conversely, advocates of minority media ownership invoke broader social rights in tying a cultural politics of difference to economic opportunity. Lastly, I assess the commonalities and differences of the three orientations to media ownership in conflicts that emerged over the issue of network neutrality. The chapter concludes with thoughts on how conceptions of media ownership articulate with the broader prevailing discourses of neoliberal citizenship.

Anti-Corporate Populism and Media Ownership

As media deregulations in the 1970s accelerated corporate mergers and the growth of media conglomerates, the issue of “media monopoly” or “corporate media power” became a focus for media ownership critiques. The two most prominent critics of “big media” are Ben Bagdikian, who from 1983 to 2000 published six editions of his widely read *The Media Monopoly* and in 2004 an extensively revised and

augmented edition, titled *The New Media Monopoly*; and Robert McChesney, who since the first publication of his *Rich Media, Poor Democracy* in 1999 (McChesney, 2000) has written several books and dozens of newspaper articles critiquing corporate media. Bagdikian offers a perspective from his experience as a journalist, *Washington Post* editor, and professor of journalism and dean at the University of California, Berkeley (Bagdikian 1995). McChesney found himself alienated in a mass communication discipline oriented toward quantitative and qualitative social sciences and turned toward Marxism, the critical political economy of Herbert Schiller and Noam Chomsky, and the public-oriented writing style of Bagdikian (McChesney, 2007, pp. 92–97).

Bagdikian's central thesis is that "[m]odern technology and American economics have quietly created a new kind of central authority over information – the national and multinational corporation" (1983, p. xv). This authority was evident in 1981, when "forty-six corporations controlled most of the business in daily newspapers, magazines, television, books, and motion pictures" – a power that had extended to just six corporations by 2000 (2000, pp. x, 21). For Bagdikian, corporate media power reduced investigative journalism, prompted journalists to avoid stories that are critical of their commercial employers, and proliferated lifestyle and celebrity material. McChesney concurs with him on these points and writes that corporate media have increased "public ignorance and apathy about the political system" while "inequality has mushroomed" (2004, p. 125). McChesney adds that advertising and profit motives promote a "hyper-commercialism" that has "carpet-bombed every corner of the nation" through content that supports advertising pitches, targets affluent consumers, incorporates product placements, and pitches junk food to children (pp. 138–173).

Such expressions of corporate power over a defenseless public can be understood as anti-corporate populism. Albertazzi and McDonnell define populism as "an ideology which pits a virtuous and homogeneous people against a set of elites and dangerous 'others' who are together depicted as depriving (or attempting to deprive) the sovereign people of their rights, values, prosperity, identity and voice" (2008, p. 3). Bagdikian and McChesney each depict the corporate media as the dangerous other to a broadly defined and victimized people, referred to as the "body politic," "the audience," or "the population." Bagdikian exemplifies this populist language by stating:

The news media – diluted of real meaning by apolitical and sterile context, homogenized with the growth of monopoly, overwhelmingly more of a service to merchants than to the audience and filled with frivolous material – are a threat to their own future but also to the body politic. (Bagdikian, 1983, p. 208)

Because the corporate media do not relate "political and social events to real forces in society," the people are helpless to challenge this corporate power: "[a] population unable to select alternative patterns of power sustains the status quo" (ibid.). Similarly, McChesney argues the corporate media produce "content that will not be difficult for audiences to grasp, will not be too expensive to produce, yet will capture people's

attention" (2004, p. 195). The "people," for McChesney, are mostly passive and do not necessarily know what they really want, but they require a different media system to "cultivate" their interests. In reference to the decline of foreign-language films in theaters, of classical music in radio, and of documentary film on television, McChesney argues that "there is little incentive over the long term for commercial media to cultivate tastes or develop interests in new material" (pp. 201–202).

In his study of populist movements, Taggart found that "populism is concerned with returning people to their natural and spontaneous condition to which they belonged before having been subject to some sort of spiritual collapse" (2000, 16). This is evident in Bagdikian's work, when he laments that "modern technology and social organization have intensified the problems of centralized control of information" because they have replaced small-town life, where "citizen talked to citizen about public policies that affected them" (1983, p. xv). With reference to Disney, Bagdikian states that "power is so concentrated, ubiquitous, and artful that, to a degree unmatched in former mixtures of entertainment, it dilutes influences from family, schooling, and other sources that are grounded in real-life experience, weakening their ability to guide growing generations" (2000, xx). McChesney (1993), too, exemplifies this tendency to reference a past less dominated by corporate power by probing historical moments when radical critiques of commercial media, as he argues, had the potential to create noncommercial alternatives.

According to Taggart, these references to better times, which precede the emergence of an overwhelming power, are linked to "fundamental dilemmas that make [populism] self-limiting" – including a general hostility to the institutions of representative government (2000, p. 2). Bagdikian and McChesney exemplify this deep pessimism by viewing the institutions of representative government as hopelessly corrupted by corporate power. Though Bagdikian proposes policy reforms such as banning multiple broadcast station ownership, taxing advertising, and subsidizing postal rates for newspapers, he remains doubtful that the corporate media would allow a full debate over such policies, because "nothing truly significant will change while there is a fundamental imbalance of power in society at large" (1983, pp. 229–237). For McChesney, the current regulatory structures have been "corrupted" by commercial interests, and alternatives must come from grassroots campaigns that support noncommercial and public-funded alternatives (2004, p. 11).

Concerned about structural inequalities in society, and in particular about class inequalities, this anti-corporate populism promotes a concept of citizenship that is concerned with the diminishing of social rights under neoliberalism. However, by representing the "people" as an undifferentiated whole and by championing noncommercial or public-funded media as the only real alternative to the fundamental dilemma of commercial media power, the populist orientation of Bagdikian and McChesney obfuscates issues that pertain to the cultural politics of difference. In their analysis, considerations of race and gender are subordinated to the broader critique of commercialism, and value judgments that seek to elevate tastes elide the class hierarchies that inform such judgments (Bourdieu, 1984). Work in critical cul-

tural studies has engaged these issues, but McChesney has found these perspectives soft on capitalism, heavy in jargon, and less interested in media policy reform (McChesney, 2007, pp. 58–60). One way to bridge these differences is to assess McChesney's use of the concept of *critical junctures*, which he adapts from the Italian Marxist Antonio Gramsci – a seminal figure for work focused on political economy and on cultural studies.

McChesney understands critical junctures as historical moments when “important new media technologies emerge, when the existing media system enters a crisis, or when the political climate changes sufficiently to call accepted policies into question or to demand new ones” (2004, p. 24). McChesney considers the broadcast reform movement of the 1930s to be an example of a critical juncture, when anti-commercial activism mounted a radical critique of advertising-sponsored radio and advocated non-profit or publicly funded alternatives. However, McChesney's anti-commercial fundamentalism on the media is at odds with Gramsci's framework for understanding class, ideology, and historical transformation. By revising classical Marxism, which invested the ruling class with an authority to assert understandings of the world that solidified their power, Gramsci theorized a more complex notion of relation of forces, one that saw them diffused across a range of class strata. The displacement of a hegemonic order required the emergence of an aligned block of class interests that could win the consent of a broad societal base through the institutions of civil society, including the media (Bennett, Mercer, & Woollacott, 1986, pp. xv–xvi). But the broadcast reform movement of the 1930s did not constitute an aligned block of class interests that won broad societal support. Rather it was limited mostly to Protestant reform-minded educators and to a professional class of critics whose cultural preferences were at some distance from those represented through popular commercial broadcasting.

McChesney argues that, between the 1927 Radio Act and the 1934 Communications Act, a “feisty broadcast reform movement composed of displaced educational broadcasters, religious groups, organized labor, farmers, women's groups, journalists, and civil libertarians like the ACLU” thought advertising-sponsored broadcasting constituted a form of “private censorship” and produced “seemingly trivial and silly programs” (1993, p. 240). The movement ultimately failed, McChesney explains, because commercial broadcasters launched an “elaborate public relations campaign to promote commercial broadcasting as an inherently democratic and American system” (pp. 40–41). Often the reformers expressed a cultural distaste for commercial radio, calling it a “moronic drivel and oral garbage” that catered to “the vulgar horde, who lack good taste and intelligence and ambition for culture. . .” (pp. 94–96). Although recognizing the cultural elitism of such language, McChesney downplays its relevance. But these cultural sensibilities are not just moments of expressed elitism among a principally anti-commercial, pro-democracy movement; they are rather structurally linked to particular class formations that emerged in the transition to advanced capitalism in the early twentieth century. Barbara and John Ehrenreich (1979) argue that, in the wake of anti-corporate populist unrest and against the

growing power of Gilded-Age profiteers in the late nineteenth century, there emerged a growing class of professionally trained managers and experts who played a mediating role between labor and capital, as administrators of increasingly complex economic structures of monopoly capitalism. Facilitated by the rapid expansion of higher education and funded by the industrialists' surplus capital, these professionals ran institutions of public health, charity, and education that "represented a politically motivated penetration of working-class community life: Schools imparted industrial discipline and 'American' values; charity agencies and domestic scientists imposed their ideas of 'right living'; public health officials literally policed immigrant ghettos, etc." (1979, p. 15).

These professional-class sensibilities were closely linked to what historians have called a "Protestant hegemony" in media reform at the time (Jowett, Jarvie, & Fuller, 1996). When jazz recordings led the record sales in the early 1920s, the General Federation of Women's Clubs, whose predominantly White Protestant members shared anti-pluralist Victorian values (Lichtman, 2008, p. 22), organized so as to "annihilate" this new music, which they believed was created by "barbaric people to stimulate brutality and sensuality" (Hilmes, 1997, p. 47). Protestant reformers thought that popular amusements lured working-class immigrants, many of whom were Jews and Catholics, away from an ethic of austere work and moral rectitude (Nasaw, 1993, pp. 174–185). Protestant reformers funded extensive social-science research projects to study the effects of popular commercial culture – including the Payne Fund, established in 1927 by Standard Oil heiress Frances Payne Bolton, which was primarily designed to find empirical proof that the movies encouraged immoral behavior (Jowett et al., 1996, pp. 1–122).

The Payne Fund awarded broadcast reformers a \$250,000 contribution, without which, according to McChesney, "there would not have been much of a broadcast reform movement, if there would have been one at all" (1993, p. 62). In praising the Fund for making the reform movement possible, McChesney is inattentive to the elitist cultural politics of the Fund and of the reformers it supported. For example, McChesney considers the efforts of the National Committee on Education by Radio to represent a defense of "the foundations of a democratic society" (1993, pp. 48–49). But the Committee was less interested in giving voice to those who lacked access to commercial radio than in inviting educators to use "radio as a cultural agency" in order to combat the negative effects of popular commercial radio, including the prevalence of "jazz of a debased sort with 'crooning'" (Tyler, 1934, p. 99; Ouellette, 2002, p. 71). The reformers' opposition to jazz and their disregard for its popularity were revealing of race and class privilege more than establishing a precedent for democratic media reform (Smulyan, 1994, pp. 93–111). Since Gramsci considered critical junctures of historical transformation to work through proximities to popular lived experience, the broadcast reform movement of 1930s was hardly a critical juncture.³

Understanding such proximities to popular cultural currents is equally relevant to considering media citizenship in recent times. The more fundamental anti-

commercialism of McChesney's critiques misses the ways in which oppositional politics and popular commercial culture have converged, for instance through the 2010 political marches on Washington convened by commercial media icons Glen Beck, Jon Stewart, and Stephen Colbert.⁴ And the anti-corporate populist tendency to subordinate the politics of cultural difference to championing the cause of "the people" fails to engage critical citizenship struggles over racial exclusion (Alexander, 2010) and immigration (Chavez, 2008).

Though subordinating issues of gender and racial exclusion to a populist class politics, anti-corporate populist-oriented media reform has created a rallying ground for a range of constituencies to voice dissatisfaction with corporate media, be they constituencies of professional journalists frustrated at working within profit-oriented news organizations, of religious conservatives offended by indecent programs, or of the thousands who petitioned the Federal Communications Commission (FCC) to tighten media ownership rules in 2002 (Blevins & Brown, 2006). To harbor these anti-corporate sentiments, in 2002 McChesney co-founded the media reform organization Free Press, to hold media reform conferences and to lobby government agencies and lawmakers (2007, pp. 153–221). The organization's increasing prominence in media policy circles is testament to the political valiancy of anti-corporate populist sentiments.

The Internet and Citizenship as Individual Liberty

While anti-corporate populist orientations to media ownership target media corporations for restricting democratic deliberation and for accentuating economic inequalities, another orientation to media ownership perceives the Internet as centrally transformative of social relations in spite of corporate power. This orientation traverses a range of positions, from libertarian to "commons" approaches, which advocate conceptions of citizenship anchored in the eighteenth-century ideals of individual liberty.

An early advocate of a libertarian approach to media ownership, Ithiel de Sola Pool published *Technologies of Freedom: On Free Speech in an Electronic Age* (1983) in the same year in which Bagdikian released his first edition of *The Media Monopoly*. Founder of the Massachusetts Institute of Technology (MIT) Department of Political Science and participant in Cold War psychological warfare research at the Center for International Studies, de Sola Pool was not concerned with commercial power but with government encroachments on individual liberty. His influential work argued for "reduc[ing] the public control" of broadcast, cable, and telecommunications media through an extension of the First Amendment freedoms of the printed press to all media in the "electronic era." He found the existing "regulations on cross-ownership of electronic media" among newspapers, broadcasters, and cablecasters to be "striking testimony to the extraordinary pervasiveness of government regulation"

(1983, pp. 8, 52–53). Sola Pool, however, was not guided by a long-term ideological commitment to such libertarianism. In 1959 he argued that “real free enterprise is impossible” in broadcasting and that “it is a proper responsibility of government vigorously to assure that this facility is used for the public good,” including for the “raising of public knowledge and taste” (Sola Pool, 1960, pp. 19–20). Two decades later, Sola Pool believed that the potential for the “convergence” of print and electronic media would negate such need for government intervention. But the potential for technological convergence prompted Sola Pool to achieve more than just an adjustment to technological developments: it made him revise his position on broadcast regulations since the 1920s. In libertarian fashion, his new position was that the government should never have been allotted such regulatory authority over broadcasting (1983, pp. 23–54, 138–139).

Whereas Cold War ideologies and enthusiasm for media convergence prompted Sola Pool to support a libertarian position on media ownership, Fred Turner (2006) traces the way in which a digital utopianism sprang from the New Communalist Movement of the late 1960s, which fused communitarian and libertarian values. Unlike some counterculturalists who protested the Vietnam War and racism in the 1960s, the New Communalists rejected urban-centered political activism and fled instead to “frontier” rural areas, to find psychic wholeness through self-sufficient communal living. Inspired by the cybernetics vision of Norbert Wiener, Stuart Brand created in 1968 the *Whole Earth Catalog*, which fused practical tips for communal living with the technocentric theories of Marshall McLuhan and others. As the communes waned, Brand and the New Communalists found interest in the nascent networked computer developments in Silicon Valley, which envisioned the potential for a new “electronic frontier” (Turner, 2006, p. 6). The New Communalists’ aspirations for a decentralized and egalitarian society fused with free-market and libertarian evangelism in the pages of *Wired* magazine, begun in 1993 by former *Whole Earth Catalog* editor Kevin Kelly. Here digital technology visionaries such as Esther Dyson, John Perry Barlow, and George Gilder joined high-tech stock analysts and right-wing politicians who sought individual liberty from government control through the promotion of free markets as the best means to realize the promise of the so-called “digital revolution.” But the New Communalists’ vision of a libertarian model of citizenship and media ownership that could create psychic well-being and nonhierarchical harmony by dismantling bureaucratic government and corporate structures was, in practice, highly exclusionary. The patriarchal back-to-the-land communes were almost exclusively White and relegated women to subservient roles. The early electronic networks, including the Whole Earth ’Lectronic Link and the Global Business Network, existed as exclusive clubs of White men, mostly affluent, in an immaterial “cyberspace” (pp. 100–101, 255–261).

A more recent articulation of individual liberty as a citizenship priority in media ownership is found in the work of Lawrence Lessig (1999), professor of constitutional law. Lessig was skeptical of the libertarian fundamentalism of many digital utopians, but he shared their priority to preserve individual liberty in cyberspace. Lessig

expressed concern about the increasing role of government and commercial regulations over the Internet in the 1990s. These regulations included laws that expanded telephone wiretapping, criminalized copyright-circumventing software, and allowed television content-filtering technologies (1999, pp. 30–60). They also included commercial Internet providers restricting chat-room sizes, implanting “cookies” on computers to trace user activities, and requiring authenticating mechanisms for e-commerce (pp. 66–71). For Lessig, these new modes of encroachment on personal liberties were made possible by a new form of regulation, which he calls “code” (the software that runs the Internet), and which operates “more pervasively over time than any other regulator in our life” – even in our “social and political lives,” or in our “ordinary lives” (p. 233). Lessig argued that we need to think about regulating software in the same ways in which the eighteenth-century founding fathers thought about placing limits on government, namely through constitutional checks and balances and through protections of free speech, privacy, and due process. These constitutional values, applied to the Internet, require free or open software, because “the lack of ownership, the absence of property, the inability to direct how ideas will be used – in a word, the presence of a commons – is key to limiting, or checking, certain forms of governmental control” (p. 7).

In his subsequent work, Lessig (2001) extended this advocacy for a software commons to a commons approach for the physical infrastructures of telephone and wireless communication. He embraced the universal interconnection legacy of telephone regulation and opposed the government licensing requirements for broadcasting, citing a few postwar economists who argued that a more efficient use of the broadcast spectrum rendered government licensing unnecessary. For Lessig, a commons in spectrum would be better realized through free markets, with the stipulation the spectrum be used efficiently (2001, pp. 74–77). Also, Lessig advocated the creation of a commons in media content by promoting less restrictive copyright laws to facilitate the right of the public to appropriate creative works. Lessig (2004) has promoted a Creative Commons copyright license that allows creators to choose from a variety of protections, less restrictive than those in existence under current copyright laws – including no restrictions on copying with simple attribution to the original author.

Lessig’s arguments for a commons approach to media ownership have informed recent campaigns to limit corporate control over copyright and to preserve the principle of network neutrality, in order to ensure that content sent over the Internet is treated uniformly. Unlike the digital utopians, who preach a free-market fundamentalism, Lessig promotes a role for federal regulations in ensuring that forms of communications software and hardware are treated as resources held in common. Yet, by elevating the significance of open Internet software, hardware, and content as instruments central to the promotion of eighteenth-century concepts of individual liberty over any other regulatory issues in our “social or political lives,” this Internet-centric articulation of citizenship either assumes that an open Internet will diminish the need for state redistributive functions to address social rights (equal access to education,

health, and a living wage), or it subordinates concern for social rights to the goal of freedom through an open Internet. Unlike anti-corporate populism, which seeks to address the inequities of a capitalist society through media ownership reform, Lessig's Internet commons approach is explicitly not a critique of capitalist forces. Revelatory in this respect is Lessig's response to the bi-partisan coalition that opposed the FCC's loosening of broadcast-ownership restrictions in 2002. Though pleasantly surprised about the scope of this opposition, Lessig wrote that "the movement misses an important piece of the puzzle," because "freedom is not threatened just because some become very rich, or because there are only a handful of big players." Rather, it is the corporations' ability to enclose the domain of intellectual property laws, and therefore to restrict how others might remake commercial culture, that makes them "bad" (Lessig, 2004, p. 269). Also, Lessig's reliance on eighteenth-century conceptions of freedom as individual liberty, conceived of universally, in spite of the historical legacies of race, class, and gender exclusion, renders insignificant the cultural politics of difference in his advocacy for a commons-centered framework for citizenship.

Legal scholar Yochai Benkler also has found the legal enclosures that threaten an open Internet to be seminal to media ownership concerns. While Lessig's position is more narrowly focused on attaining a commons in information property, with the implied notion that this commons is essential in enabling individual liberty and prosperity in all life, Benkler has offered a more comprehensive, idealized vision of society – one based on the revolutionary promises of a "networked information economy" (Benkler, 2006, p. 2). According to Benkler, if unconstrained by big government and corporate power, the networked information economy "holds great practical promise: as a dimension of individual freedom; as a platform for better democratic participation; as a medium to foster a more critical and self-reflective culture; and, in an increasingly information-dependent global economy, as a mechanism to achieve improvements in human development everywhere" (ibid.). Benkler believes that government regulations during the "industrial information economy" preserved the power of Hollywood, of the recording industry, and of broadcasters to shape opinion and to "program toward the inane and soothing, rather than that which will be politically engaging" (p. 11). While this articulates with the cultural sensibilities of anti-corporate populists who dismiss the existence of political negotiations in popular commercial culture, Benkler does not call for more government regulations of corporate media. Rather, government regulations in the "networked information economy" should be minimized, to allow "non-market" and private voluntary modes of "social production" to bloom – for example the 50,000 volunteers who monitor the collaboratively authored Wikipedia (pp. 16–28, 70–74). Further, "because the outputs of the networked information economy are usually nonproprietary, it provides free access to a set of basic instrumentalities of economic opportunity and the basic outputs of the information economy" (p. 13). But can voluntary modes of participation through the Internet really provide "a set of basic instrumentalities of economic opportunity?"

Ellen Seiter (2008) has questioned these assumptions in Benkler's theories through reference to Pierre Bourdieu's work on how the interrelations between social, cultural, and economic capital create impediments to realizing opportunities in the information

economy. For Bourdieu (1984), social capital comprises the set of resources that are available to an individual or group by way of their affiliation with particular social, familial, and institutional relationships and networks. In her work on digital education, Seiter found that a “lack of social capital screens out working-class youth from employment in the highest income and most challenging jobs in the digital realm,” and that “good jobs in new media are jobs for the young, the well connected, and those with enough family capital to float them through lengthy education, and long periods of employment-seeking in expensive housing markets” (Seiter, 2008, pp. 40–42). Technocentric conceptions of citizenship such as Benkler’s subordinate these dynamics of social and economic capital to the emancipating promises of networked computing. In doing so Benkler offers a more libertarian conception of citizenship, which places individual autonomy and volunteer social production above consideration for social rights and for the redistributive functions of the state in addressing unequal access to education, housing, and work. By evoking classical liberal notions of individual autonomy, Benkler’s conception of citizenship, much like Lessig’s, eclipses consideration for the cultural politics of difference (*ibid.*, pp. 133–175).

To sum up, the Internet-centered orientations to media ownership considered above include Sola Pool’s advocacy for extending print standards of free speech to electronic media, a New Communalist-inspired digital utopianism, Lessig’s commons approach, and Benkler’s network information economy. Each case favors a form of citizenship that, in turn, prioritizes eighteenth-century conceptions of individual liberty from government and from corporate authority. For Sola Pool and the digital utopians, freedom is the lack of government encroachment. For Lessig, an information commons creates the freedom to innovate and create without surveillance. For Benkler, the information economy promises all of these and has the potential for a more equitable distribution of resources and economic opportunities worldwide. In prioritizing individual liberty over an open Internet as the foundational means to achieve equality of opportunity in society, each of these Internet-centered approaches articulates a concept of citizenship that no longer requires the redistributive authority of the state to secure social rights. Built as it is upon a foundation of an eighteenth-century liberal conception of the universal, autonomous, liberal individual, each of these Internet-centered conceptions of citizenship and media ownership fails to recognize class, gender, race, or national privilege as impediments to liberty, to democratic participation, or to equal opportunity. Such dismissals of our need for the state to redistribute economic and cultural resources are challenged by those who are concerned with racial minorities’ lack of opportunities to own media.

Minority Media Ownership and the Cultural Politics of Social Citizenship

In 1973 the US Court of Appeals for the District of Columbia required the FCC to consider race as a factor in granting broadcast licenses. The ruling involved a case in

which the FCC awarded a television license to a business organization comprised of people who were all white and residents of the station's service area over a business organization comprised of African Americans who were not all local residents. The FCC assumed that the "Communications Act, like the Constitution, is color blind" and that "service to the public in programming" was the sole criterion for consideration – "not the race, color or creed of an applicant" (*TV 9, Inc. v. FCC*, 1973, p. 936).⁵ Disregarding race as a factor, the FCC followed its long-stated goals to facilitate localism in broadcasting and prioritized the applicant with station owners who were all local residents.⁶ The appellate court faulted this color-blind logic and argued that the "public interest" is "a broad concept, to be given realistic content," which cannot be interpreted through constitutional law alone. Further, the court argued that, "when minority ownership is likely to increase diversity of content, especially of opinion and viewpoint, merit should be awarded" (*ibid.*, pp. 936, 938).

The court's decision prompted civil rights leaders to organize media advocacy groups in order to expand minority media ownership and enforce the Equal Employment Opportunity (EEO) laws that Congress adopted in 1968. However, these efforts were frustrated by a recalcitrant FCC. The National Black Media Coalition (NBMC) submitted 61 minority ownership and EEO proposals to the FCC, but all were rejected. The first African American FCC commissioner, Benjamin Hooks, dissented on 30 of these rejected proposals (Honig, 1984). The FCC crafted vague and variable guidelines and worked within a "zone of reasonableness" that largely evaded enforcement, even though minorities owned just one half of 1% of all broadcast licenses (Fife, 1987, p. 494). Continued advocacy prompted the FCC in 1978 to adopt two proposals: a Tax Certificate Policy, which gave tax relief to broadcasters who sold their properties to minorities; and the Distress Sale Policy, which allowed broadcasters whose licenses were threatened with revocation to sell to minority buyers at 75% or less of fair market value. However, between 1976 and 1984 the FCC held no hearings on EEO violations, despite receiving hundreds of complaints (Honig, 1984).

In the 1990s Congress and the courts became more resistant to government provisions to assist minority media ownership. In 1995, in a partisan political maneuver, the Republican-controlled Congress repealed the Tax Certificate Policy (Ofori and Lloyd, 1999). That same year the Supreme Court revised the minority-ownership reasoning of the 1973 appellate court decision by requiring a higher level of evidence for identifying and addressing racial discrimination. This meant that the Supreme Court was less likely to recognize the constitutionality of government programs tailored to assisting minority media ownership than it would race-neutral remedies such as aid to small businesses (Horwitz, 2005; Williams, 1995). In 2007 the FCC adapted 12 new rules to assist small media businesses that had some benefit for small minority-owned media businesses. Civil rights organizations lobbied to include provisions for "socially and economically disadvantaged business," to no avail (Honig, 2007).

Though Congress, the courts and federal administrators have moved away from recognizing a causal relationship between minority-owned media and the expression

of cultural difference as a compelling government interest, research on minority-owned media has demonstrated such a relationship. In a 1999 study, researchers conducted interviews with staff at Black-owned commercial radio and television stations and found that minority-owned broadcasters delivered “a wider variety of news and public affairs programming and more ethnic and racial diversity in on-air talent” than stations not owned by minorities (Bachen, Hammond, Mason, & Craft, 1999). Another study found that, in mid-2009, 73% of the 815 minority-owned radio stations aired “minority-oriented formats” – including “Spanish, Urban, Urban News, Asian, Ethnic and Minority-oriented Religious formats such as Gospel and Spanish-Christian” (Sandoval, 2009, pp. 19–20). In her study of the Black-owned Chicago commercial talk radio station WVON and its listening audience, Squires found that Black station-owners and staff produced programming that addressed race-conscious issues and frameworks that created a space for challenging racial discrimination through forms of political action and organization. Listeners felt strongly about supporting Black-owned media because they felt that “White-owned and mainstream media sources continue to misconstrue the Black community” (Squires, 2000, p. 83). Of course, correlations between diverse ownership and diverse content are complex within particular commercial dynamics. The Black-owned station group Radio One changed the format of its Louisville, Kentucky station from urban to country in 2004, and that of its Augusta, Georgia station from blues to modern rock in 2003, though most of its stations air gospel, urban and jazz music formats (Reed-Huff, 2006). Even so, these examples offer evidence for a compelling relationship between minority ownership and expressions of cultural difference, and how these expressions have facilitated dialogue and action to address past and present forms of discrimination.

Campaigns designed to promote minority media ownership share anti-corporate populist orientations in their general impetus to challenge the leveraged power of media conglomerates and to support more decentralized media ownership. But anti-corporate populist critiques make no reference to the specificities of racial discrimination in relation to media ownership, implying that a broader normative critique of commercial economic structures and advocacy for nonprofit or noncommercial media will address racial discrimination. This position ignores historical struggles against racial discrimination that recognize the relationships between racial and economic disparities. For example, Singh traces how the civil rights movement from the 1930s through to the 1960s articulated a form of social-democratic citizenship that never reduced racial inequity to the inequities of capitalism but also insisted that racial discrimination demanded affirmative measures for addressing structures of economic inequality. As he put it, “the symbolic struggles for black rights and recognition within the nation-state could not be separated from the material struggles over distribution” (Singh, 2004, p. 214). Advocates of minority media ownership have made such connections in prioritizing economic access to a communication industry invested with representational authority.

The anti-corporate populist language of decentralization or “localism” also fails to address racial discrimination. As the above FCC case regarding television allocation

and race reveals, the FCC used the concept of localism to validate “color-blind” reasoning in assessing public interests. Cautioning against “mindlessly jumping on the anti-consolidation pro-localism bandwagon,” legal scholar La Vonda Reed-Huff (2006, p. 103) argues that racial discrimination requires more than access to local expressive outlets. Rather it requires deliberation on a national scale, for instance through the widely syndicated radio talk shows of Tom Joyner and Tavis Smiley, who have faced racial barriers in seeking nation-wide syndication (pp. 131–134). Also, anti-corporate populist scholars who assert that commercial media and democracy are incompatible ignore the historical precedents for how Black commercial media have helped to constitute a national Black identity and culture. For example, Adam Green traces how African American participation in commercial music in Chicago in the 1940s and early 1950s promoted a national “sense of racial distinction” where “[t]he market played a catalyzing, rather than diluting or compromising role in these arts’ developments” (2007, pp. 13–14).

Recent ownership debates regarding the Internet have revealed conflicting priorities across the three approaches to media ownership considered here. Anti-corporate populist and Internet commons approaches to Internet ownership have prioritized maintaining the network neutrality principle, which prevents Internet access providers from discriminating against users regarding the flow of content, applications, and services over the Internet. Lessig and McChesney (2006) co-authored an opinion editorial in the *Washington Post* that combined anti-corporate populist and market libertarian sensibilities:

Most of the great innovators in the history of the Internet started out in their garages with great ideas and little capital. This is no accident. Network neutrality protections minimized control by the network owners, maximized competition and invited outsiders in to innovate. Net neutrality guaranteed a free and competitive market for Internet content. (Lessig & McChesney, 2006, n.p.)

In contrast, the Minority Media & Telecommunications Council (MMTC), representing dozens of civil rights organizations and minority media advocates, has not made network neutrality an Internet policy priority. Rather, MMTC’s broadband Internet advocacy has focused on extending user access to “low-income, minority and multicultural communities” by way of subsidies, literacy programs, teacher training and provisions to aid minority business owners in bidding for spectrum (Honig, Lazarre, Miller, & James, 2009, p. iii). The MMTC’s policy on network neutrality supported the concept of an open Internet, but it also expressed concern about how network neutrality rules might inadvertently raise user rates, particularly on wireless broadband, which African Americans and Latinos use more than White Americans. Also, the MMTC was concerned that network neutrality could restrict broadband service providers from charging heavy corporate users more and from using these additional revenues to keep consumer rates low, to invest in extending service, or to facilitate minority participation. To ensure that such additional profits would get

channeled to low-income and minority businesses, the MMTC recommended a program modeled on the Community Reinvestment Act. This law was based on the concept that lending institutions have an affirmative obligation to meet the credit needs of local communities. The MMTC proposed to extend such affirmative efforts to broadband Internet providers; and this, in turn, might include extending services to low-income areas, funding digital literacy programs, or providing technology support for new business entrants. The MMTC also recommended considering extending network neutrality discussions to Internet platforms and search engines to ensure that Google and other dominant providers do not unfairly favor established brands or businesses in ordering search results, a concept that would likely disturb libertarian proponents of network neutrality (Honig & Lancaster, 2010).

The reluctance to fully support network neutrality in the civil rights community ignited consternation among some supporters of network neutrality legislation. Sixteen civil rights organizations, including the National Black Caucus of State Legislators and the League of United Latin American Citizens, officially supported the MMTC's position on network neutrality. Eighteen members of the congressional Black caucus signed a letter of caution regarding the potential negative consequences of network neutrality for communities of color. The National Association for the Advancement of Colored Peoples (NAACP) was neutral on the issue. When a spokesperson for the advocacy group Public Knowledge insinuated that "minority groups" opposed net neutrality because of their financial ties to telecommunications companies or because of their ignorance of the issue, the NAACP and the Hispanic Technology and Telecommunications Partnership found these charges "astoundingly offensive" (Aguilera, 2009, n.p.). But other minority interest groups supported network neutrality; these included the National Hispanic Media Coalition and the Center for Media Justice, as well as online journalism sites focused on issues of importance to African Americans, for example colorofchange.org and [Black Agenda Report](http://BlackAgendaReport.com). Ensuing debates within African American communities were inflected with intergenerational conflicts when younger activists faulted veteran civil rights organizations for their ties to big corporations and for their ignorance of the potential benefits of an open Internet (Dixon, 2010, n.p.).

Despite having different priorities for network neutrality, these communities of color reconciled their priorities by recognizing that network neutrality alone would not broaden access and opportunities for low-income and minority communities. Addressing broader structural barriers to opportunity, as Center for Media Justice Executive Director Malkia Cyril put it, requires taking on

the choke-hold influence of corporate investment in communities of color and poor communities that has led to the massive privatization of all public infrastructure – including our hospitals, our schools, and now, with the recent Supreme Court decision to lift limits on corporate political spending – our government. (Cyril, 2010, n.p.)

This insistence on coupling network neutrality with broader structural reforms was absent in Lessig, and McChesney's claiming network neutrality created "free and competitive market for Internet content" that required little capital for new entrants. Similarly, the anti-corporate populist-oriented Free Press characterized network neutrality as creating a "level playing field" for all, using an image of an African American boy to illustrate its universal benefits (Perlman, 2010, n.p.). Anti-corporate populist and commons orientations to network neutrality ultimately subordinated issues of structural racism by severing the relationship between economic opportunity and structures of racial discrimination. As discourses of citizenship, these positions invoked the neoliberal promise that market competition over an open Internet would create equality to a seemingly full range of life opportunities, regardless of one's social, economic, or cultural location in society. Such Internet-centric orientations to economic opportunity diminish the scope of social rights that, otherwise, call for redistributive programs to address structural forces of inequality – from the race-conscious broadband initiatives promoted by MMTC to the broader defense of social rights such as affordable healthcare, quality education, economic security, and cultural recognition.

Conclusion

Media ownership debates and research have focused on whether or not commercial media ownership structures facilitate diverse viewpoints for democratic deliberation, and on how to measure media content diversity accurately enough to assess this. Rather, this chapter draws from critical work in media and cultural citizenship, in order to consider media ownership debates as sites for constituting and contesting conceptions of citizenship that have significance beyond debates over media ownership regulation. To do so, it has considered the articulations of citizenship that informed three orientations to media ownership: anti-corporate populist, Internet-centric, and minority ownership. Emphasis was placed on the historical contexts of each orientation's emergence, on the rights and values that each prioritized, and on their broader significance to the status of social rights and cultural politics in neoliberal times.

Anti-corporate populist critics of media ownership defended a victimized "people" against the commercial power of ever-expanding media conglomerates. According to this view, these profit-oriented media conglomerates fed apolitical information and frivolous culture to a mass audience, creating ignorance and apathy in the body politic. Only when this corporate media stronghold is broken can a more democratic challenge to moneyed interests take place. Anti-corporate populism has resonated as a common framework for media ownership reform, including support for public-funded media alternatives. However, in championing the cause of "the people" as a homogeneous whole, anti-corporate populism obfuscates the ways in which

economic disenfranchisement has been interrelated with race and gender exclusion. Also, anti-corporate populism's tendency to equate commercial media culture with corporate domination loses sight of how oppositional struggles have worked through popular, lived experience via popular commercial culture, and how noncommercial media movements have been bound to class, race, and gender privilege.

Internet-centered orientations to media ownership, from those of digital utopians to commons approaches, emerged out of perceptions that networked computing has fundamentally restructured the economic, social, and cultural conditions for democratic society. While anti-corporate populism promotes the redistributive authority of the state in order to secure social rights, a political goal that is impeded by corporate media control, Internet-centric approaches call upon the state only minimally, to secure a commons in intellectual property and an open Internet. According to this perspective, with the democratizing power of an open Internet to spur innovation, creativity, and citizen participation, corporate power throughout society will dissipate, as well as the need for the state to redistribute economic and cultural resources. Rather than articulate citizenship through twentieth-century conceptions of social rights and of the welfare state, Internet-centric approaches draw from eighteenth-century conceptions of citizenship that prioritized individual liberty from state power. While the twentieth-century movements to expand social rights recognized class, gender, and race privilege as barriers to equal opportunity and freedom, eighteenth-century expressions of citizenship emerged from a more abstract, universal conception of the individual in society, which subordinated consideration of class, race, and gender privilege. Inspired by this universal ideal of individual liberty, Internet-centered conceptions of citizenship and media ownership consider the liberating potential of an open Internet to transcend class, gender, race, or national privilege.

For civil rights organizations and minority media advocates, conceptions of citizenship have been less media-centric, reduced neither to populist critiques of media conglomerates nor to the sole opportunity-creating power of an open Internet. For disempowered communities of color, gaining access to media ownership was but one among broader ongoing struggles to gain access and opportunity across all societal institutions. Addressing these broader forms of racial exclusion in society required the redistributive authority of the state, including provisions to increase minority media ownership. For minority media advocates, media ownership was both an avenue for economic opportunity and a means to engage in the symbolic struggle over cultural recognition. In conceptualizing the interrelationship between economic opportunity and the cultural politics of cultural recognition, civil rights organizations and other advocates for minority media ownership clashed with anti-corporate populist and Internet-centric orientations to media ownership over the issue of network neutrality. Rather than claiming that network neutrality was a means to level the playing field of economic opportunity for everyone, as did those from anti-corporate populist and Internet-centric positions, minority media advocates insisted on connecting support for network neutrality with advocacy for broader

structural reforms to address racial inequality, including affirmative obligations by state and market actors to make economic and cultural resources available to disenfranchised groups.

While the three orientations to media ownership share the goal of expanding viewpoint diversity in media and find that corporate power would impede this goal, the conceptions of citizenship invoked through anti-corporate populist and Internet-centric approaches to media ownership reform inhibit their capacity to consider the ways in which race and gender privilege operates within corporate media and throughout society at large. If widening economic and cultural opportunities is a goal of these media ownership reform movements, it seems imperative to consider the rationales for citizenship that emerge in minority media ownership debates not only for addressing complex issues of media ownership, but also for conceiving of a more inclusive and expansive notion of citizenship more broadly.

Music in the New Capitalism

Timothy D. Taylor

ABSTRACT

This chapter attempts to reinstate capitalism as the transcendent category of analysis for music production. This new capitalism is marked by the ascendancy of the new petite bourgeoisie. This class promulgates an ideology of the hip and the cool and has an outsized role in the production of culture, since most musicians today are forced to permit their music to be used in commercials. The new class is comprised of new kinds of cultural workers, who can deploy their taste as music supervisors, choosing music for film and broadcasting in an era when more music is more easily available. Another aspect of the new capitalism is that workers can be compensated less, or not at all. In the realm of advertising composition is increasingly outsourced, as it simple to upload video to servers around the world. Users enter data on songs in online databases and their search habits are recorded and used to sell more products, all without compensation.

Introduction

Much of my work has been concerned with attempting to apprehend the present moment – a moment that has been characterized in many ways in the couple of decades to which I paid attention: postmodern, late capitalist, a network society, an

information age, an era of globalization, neoliberalism – and many more things. It has long seemed to me, however, that the primary category ought to have something to do with capitalism, not in a vulgar Marxist sense of the economic base “determining” a (cultural) “superstructure,” but in the sense of capitalism as a social form that profoundly shapes people’s relationships to each other.

I am thus advocating that we attend both to capitalism and to culture and that we see how one inflects and influences the other. This is by now a rather familiar combination of Marxist and Weberian perspectives; but it is, unfortunately, remarkable that neither component has had much impact on the study of music, which remains overly wedded to positivistic, and thus ahistorical and acultural, modes of analysis. There are, however, some exceptions – for instance the work of Steven Feld, Charles Keil, and Anthony Seeger, all of whom, I should note, were not trained as ethnomusicologists but as anthropologists (for some of the few explicitly Marxist books in music studies, see Keil & Feld, 1994; Qureshi, 2002; Seeger, 2004).

What I want to do in this chapter is to attempt to bring together some of the themes I have been exploring for many years, but under the rubric of the study of capitalism: new capitalism, which was facilitated by neoliberal ideologies and by new communications technologies, and which has a global effect. Undue focus on these (or other) elements as aspects of the new capitalism has tended to obscure the long-term workings of capitalism as a historical economic system and as a social form.

Thus it is my goal here to attempt to reinstate capitalism as a transcendent category of analysis; and I propose to do this by way of understanding what was going on in the recent past (and carried over into the present) as part of long-term processes, which are rooted in the economic and in the social and are not unique either to the present or to the recent past, as so many studies seem to assume. What follows is, in part, a rehearsal of some of the issues I have written about in the past, but also an attempt to bring them together under this broader framework, which was not always present in some of my earlier publications.

The New Capitalism

I borrow the phrase “new capitalism” from Richard Sennett, who has analyzed the social and cultural effects of this phenomenon in a couple of recent books (Sennett, 1998, 2006). Sennett is concerned with the cultural effects of the new capitalism, but I will begin here with a discussion of historical, economic, and political factors.

While there has generally been a dearth of writings focusing on capitalism in recent years, it must be acknowledged that scholars writing from Marxian perspectives have continued to study it. Probably the first major salvo in attempting to understand the new capitalism was Ernest Mandel’s often cited (though, I suspect, little read) book from 1972, *Late Capitalism* (Mandel, 1978). For many readers, this book was brought to attention by Fredric Jameson in his influential “Postmodernism,

or, the Cultural Logic of Late Capitalism” (Jameson, 1984). References to Mandel were few, but Jameson’s endorsement mattered. Nonetheless Mandel’s writing, given its technical nature and its engagement with a long history of Marxist arguments about capitalism, was ultimately less influential than Jameson’s article.

Yet there are aspects of Mandel’s book that continue to be useful. Such is his periodization of capitalism into three historical phases: “competitive capitalism,” from the onset of the Industrial Revolution until about 1880; “imperialism,” which lasted until the end of World War II; and what he called “late capitalism.” This current phase is marked by the declining importance of the state; the monopolistic and oligopolistic pursuit of massive profits and its global growth; the increased concentration of capital in huge corporations; the defeat or decline of labor and other kinds of oppositional movements; the globalization of financial capital; the rise of new, transformative technologies such as the personal computer; an economy increasingly dependent on the defense industry; the growth of debt; new forms of colonialism; an increasing polarization of wealth; heightened consumption – and still more, at least according to some scholars.

But Mandel’s book proved to be less influential than it might have been without the author’s engagement with sometimes arcane aspects of Marxist theory. Other books appeared in the 1980s and early 1990s that continued to wrestle with what was widely perceived as the changing nature of Western capitalism, in particular those of Scott Lash and John Urry (1994) and of David Harvey (1989). Lash and Urry noted the rise of global corporations with an international division of labor; the separation of finance from industry; the growth of industry in small communities and rural areas; the transmission of information and knowledge electronically rather than through print; in the social sphere, a movement out of the cities and toward the suburbs; the pursuit of increasingly narrowly defined interests; and new kinds of social groups, such as the new bourgeoisie (see also Bourdieu, 1984). Harvey, for his part, made much of the “flexible accumulation” – a post-Fordist type of industrial production, of which he says that it is “marked by a direct confrontation with the rigidities of Fordism,” resting as it does on “flexibility with respect to labour processes, labour markets, products, and patterns of consumption” (Harvey, 1989, p. 147).

Some authors have argued that new capitalism relies heavily on the production of culture. Lash and Urry, early articulators of this position, noted in 1994 how “economic and symbolic processes are more than ever interlaced and interarticulated; that is, that the economy is increasingly culturally inflected and that culture is more and more economically inflected” (Lash & Urry, 1994, p. 64). Subsequent authors have pursued much the same line (e.g., Scott, 2008). Additionally, as the production of culture has changed, so has the culture of production (see Boltanski & Chiapello, 2005). The production of culture is driven also by an ideology of the hip and the cool, as I will discuss below. This ideology is related to the facts captured by Richard Sennett when he argues that the new capitalism is marked by pervasive ageism, which is driven by more than economic factors: younger workers might already have technical knowledge that older workers would acquire only if they were

retrained; younger workers cost less; and so on. Sennett also discusses the increased importance of the notion of “talent” (or, as my own research has revealed, “creativity”: Taylor, 2012).

I think that part of the reason why capitalism fell off the radar screen is the increasing “humanitization” of the softer social sciences, which came in with the cultural studies boom of the 1980s. It was striking to see how Jameson’s influence was filtered into subsequent publications, with all the Mandel-derived thinking excised from it and with postmodernism reduced to a list of traits or characteristics such as “depthlessness,” “waning of affect,” or “pastiche.” The predictable effect was a seemingly ever-expanding number of lists with an equally expanding number of terms, as I have written elsewhere (Taylor, 2002). Postmodern culture registered the effects of late capitalism, which was largely ignored by many scholars, unanalyzed.

Writings that did place capitalism at the center of their analyses have slowed to a trickle in the last couple of decades. Many recent books have been concerned much more with other phenomena of the present or of the recent past – such as the advent of new digital technologies, which made people increasingly interconnected, in a “network society” (as Manuel Castells, 1996 calls it); or, as we have seen, globalization and neoliberalism. But in these writings capitalism tended to take a backseat to the new technologies or to their effects: capitalism was simply assumed to be, or interpreted as, an effect more than a cause. In what follows I will address the questions of globalization, networks, and neoliberalism not as singular developments, but as salient characteristics of the new capitalism.

Music in a Neoliberal World

Let me start with the question of neoliberalism. Neoliberal policies predate what we have come to think of as “globalization” and the interconnected world, though this world couldn’t begin to be as fully realized as it has been recently until the rise of new communications technologies, which I will consider in the next section.

Even though “in a general way,” as Pierre Bourdieu writes (1998, p. 34), “neoliberalism is a very smart and very modern repackaging of the oldest ideas of the oldest capitalists,” it is important to remember that one cannot understand capitalism simply in terms of the “economic logic of capital and its accumulation” (Foucault, 2008, p. 164). Capitalism must instead be understood by examining specific economic–institutional formations, which vary historically and geographically. Neoliberalism is a particular economic–institutional formation of the so-called developed countries, and its US form is particularly virulent (see Klein, 2008).

By “neoliberalism” I mean to refer to the body of ideologies that originated in the 1950s and really gained traction in the 1980s, being facilitated by the rise of new communications technologies.¹ These ideologies advocated deregulation, privatization, the withdrawal of the state from many of its former responsibilities to its

citizens, and, in general, “the insertion of the ideologies of enterprise and competition into all aspects of economic and social management” (Flew, 2009, p. 6). Neoliberalism advocates the working of the private sector over the public and relies on the wisdom of the markets; it emphasizes a kind of hyperindividualism by wielding ideologies of consumer choice and by fostering what has become known as the “care of the self.”

Foucault observes that neoliberalism in the US is not “just an economic and political choice formed and formulated by those who govern and within the governmental milieu” (Foucault, 2008, p. 218). It is, rather, “a whole way of being and thinking. It is a type of relation between the governors and the governed much more than a technique of governors with regard to the governed” (*ibid.*).

Neoliberal policies and practices have dramatically altered the landscape of the production of music in the US. Record labels and other entities that produce music, such as advertising agencies and music production companies, were bought and sold at unprecedented rates; the legendary adman Bill Backer told me that advertising agencies became “pawns in a Wall Street game of mergers and acquisitions” (Backer, 2004). Many of the people I interviewed for my project on music and advertising (Taylor, *in press*) spoke negatively of the changes that came to their industry in the 1980s, when budgets were reduced, music was increasingly tested on focus groups, and the bottom line became all important.

The increased interest in profit has meant that the music industry – and the culture industries more generally – have sought to find the next blockbuster rather than nurturing a number of artists or projects, in the hopes that one or two might become successful, and using that success to subsidize the other artists or projects. With the rise of new technologies that increased the cost of production, it became much more efficient to produce one blockbuster than a series of recordings by various musicians, in the hopes that one might make it big.

Newer technologies have also made it possible for musicians to produce high-quality recordings of their own music in their own studios. The difficult part for them has come to be not so much the production of their own music or its distribution, which can be easily accomplished online now, but getting the word out, marketing. The major record labels have become increasingly more marketing than recording companies, since this is the one remaining function that is beyond the capabilities of musicians. A band can erect a website, but this is not the same thing as spending thousands – or millions, in the case of major releases and of many films today – on marketing (see Lash & Urry, 1994).

Probably the most significant policy shift in the last couple of decades has been the passage of the Communications Act of 1996, which allowed a single entity to own more than one radio station in the same city and in the same market. The result has been an utterly predictable trend toward monopolization. Only a decade after the passage of the law, the top four radio station owners broadcast to almost a half of all listeners, and the top ten owners broadcast to almost two thirds of the listeners (DiCola, 2006). As a result, playlists have been streamlined, since it is cheaper and

more efficient to play the same songs repeatedly at every station owned by a single company than to attempt to locate a broader spectrum of songs to air, or to permit disc jockeys (DJs) to select them.

One profound effect of this situation has been to break down – remarkably quickly – many musicians’ resistance to permitting their music to be used in commercials. For decades, musicians desiring to preserve the appearance of independence from commercial processes refused to allow commercial uses of their music; but this position began to weaken, especially for younger musicians, when it became increasingly difficult to achieve radio airplay.

And, as the culture industries (in which I include not just the traditional industries of film, television, music, and so on, but also advertising and marketing) increasingly target youth and increasingly seek to discover – or create – what is the hippest, coolest product around (until the next one, tomorrow or the day after), these industries have become increasingly ageist, as many have written (see Nixon, 2003; Sennett, 1998), signaling a more general destabilization for many workers more generally. Barbara Ehrenreich’s “fear of falling” (Ehrenreich, 1989) – the fear of losing middle-class status – is increasingly becoming the fear of falling and never rising again, or even of never rising at all, as the polarization of wealth that began in the 1980s escalates. Douglas Coupland has coined a new phrase to describe this phenomenon: “blank-collar workers,” “formerly middle-class workers who will never be middle class again and who will never come to terms with that” (Coupland, 2010, §A, p. 29).

Another aspect of the world of neoliberal capitalism is that labor has become cheaper or, in some cases, free; cheaper in the sense that, in some areas of the culture industries, people have been terminated and rehired on a freelance basis, which means that they receive no benefits. (In a country such as the US, which is increasingly changing into a Third World state with a massive gap between rich and poor and in which social programs lag far behind those in Europe, the absence of a good healthcare plan or retirement plan is an extremely serious issue.)

Free labor is made possible by companies’ reliance on the World Wide Web to gather information on consumers’ tastes and purchasing habits. Many years ago, Dallas Smythe wrote a provocative article about what constituted the commodity in broadcasting and concluded that it was the audience (Smythe, 1977). This article received some attention at the time of its publication, but it hasn’t been much considered since (see, however, Newman, 2004; Taylor, *in press*). Yet Smythe’s main point is still worthy of consideration. Advertisers and advertising agencies guarantee the attention of a certain demographic group of viewers at certain times and in certain places, to advertisers who seek to purchase that attention. Therefore, Smythe concluded, the commodity in broadcasting is not the program, nor the goods advertised on it, but the audience itself.

This seems straightforward enough, and most US viewers know it already: a favorite program could be cancelled, since the viewership wasn’t large enough to permit charging sufficient fees to make airing the program profitable. But if we fast-

forward to the present and to the World Wide Web, we find the surfers' time being harnessed in new ways, and not simply by being spent on websites that are supported by advertisements. If one patronizes a commercial website such as amazon.com, which garners information about consumer tastes in order to target these consumers and others with similar tastes more efficiently, then can we not consider these consumers' time to be uncompensated labor?

Or take another example: websites such as Netflix collect viewers' film-rental habits in order to make recommendations to future patrons. Uncompensated labor, too.

Or, if one purchases a new compact disc (CD) – a dwindling number of people, admittedly – and one happens to be the first to play that disc in iTunes, one can enter information on the compact disc that will then be made available, via a central database, to anyone who inserts the same recording. More unpaid labor. In fact, it seems to be a point of pride for some that they were the first to enter the information for a particular recording.

Perhaps this is all a form of generalized exchange à la Lévi-Strauss (1969), since any individual user can benefit from another's labor. But this is generalized exchange with strangers on a massive, global scale, strangers in separate commodity cultures networked around the world. Relying on informationalized and databased consumer tastes is one thing. With the rise of new communications and other technologies that made the proliferation of musics from around the world common – or perhaps I should say musics from around the world more common in the West, since the West's musics had been recorded and distributed almost since the beginning of recording in the late nineteenth century – new positions emerged that helped viewers, listeners, and others navigate their way through this plenitude of music.

Awareness of the necessity of such guides emerged with the massive success of the film *The Big Chill* in 1983 and its accompanying soundtrack. People in the music industry realized not only that marketing with music to baby boomers could be lucrative, but that the people who choose music for such albums – music supervisors – could be treated as important advisors. In broadcasting and advertising, the rise of the music supervisor has been an important recent development.

The music supervisor is a kind of cultural intermediary who has emerged in this economy: the person who is good at sniffing things out. It is the music supervisor's job to seek pre-recorded music for use in film and in broadcasting. This practice has become so common now that many US television programs conclude with a few minutes of a song, without dialogue. Television-program websites list songs played for curious listeners; CD compilations of songs from television programs can (or could) sell hundreds of thousands of copies. Music supervisors have largely replaced radio DJs as the humans choosing the music they hear (to the extent that radio stations with DJs who choose their own music tout the fact that the station plays "hand-picked music," as a local station here in Los Angeles claims).

According to one music supervisor,

What will work for me and my film will also work for those artists in their careers. Obtaining a film placement or a television placement is a very valuable and positive step in a live musician's career. It's kind of like what getting on the radio meant in 1955. [. . .]

[A] lot of [television] shows are music driven. A huge percentage of the people who are of record-buying age buy their music based on what they've seen on television. The people who are selecting music for television shows are trusted; their taste is trusted by the watchers of those shows. So in a weird twist of fate, I am able to function in much the same way that, say, Wolfman Jack did back in 1970 – by finding songs and helping people discover new music. (Levine, 2007, p. 80; see Taylor, 2012)

Workers in the advertising industry perform similar roles today. Their constant seeking of the hip and the cool in popular music in order to employ it in commercials has made them in some sense even more important than music supervisors, since advertising drives broadcasting in the US.

These new cultural intermediaries are part of what Pierre Bourdieu (1984) called the new petite bourgeoisie: people with generally high cultural and/or educational capital from relatively privileged backgrounds, but who have opted out of the professions in order to work in the culture industries (see also Featherstone, 2007). I have not interviewed music supervisors to see if they fit this profile, but those in the advertising industry whom I have interviewed generally do (see Taylor, 2012). While Bourdieu's new petite bourgeoisie mediated between high culture and the masses, in today's world the ideology of the hip and the cool has become so dominant that it is coming to displace the role of high art (or what Bourdieu called "legitimate culture"); so what is mediated is no longer high culture as much as it is the hip and the cool (see Taylor, 2009). The hip and the cool is closely linked to youth culture, and I would thus link its importance to the ideology that values youth over age and experience, discussed by Sennett (1998).

The ideology of the hip and the cool, to which the advertising industry is particularly sensitive, has allowed this industry to become extremely influential in the production of culture – so influential that, as I concluded (Taylor, 2012), to make a distinction between "advertising music" and "music" is today essentially meaningless.

Music in a Networked World

Most readers over the age of 30 probably have a memory of how Things Had Really Become Different with the advent of digital technologies, but perhaps especially of the Internet. For me, the year was 1996. I was in the throes of writing my book *Global Pop* (Taylor, 1997) when a magazine chronicling the life and culture of the Himalayas arrived in the mail. There was an article about a popular song that had taken Pakistan and other parts of South Asia by storm. I was quickly able to hear it thanks to a tinny

RealAudio link. That was striking enough. Then I went to my local Indian music store, where I heard the music coming over the shop's speakers as I walked in – cassettes had just arrived. The song – “Billo De Ghar,” by Abrar-ul-Haq – was originally released in 1995. An exceptionally catchy tune, even for listeners who don't understand Punjabi and Urdu, it eventually went on to sell over 16 million copies.

It was, of course, new technologies that made music from around the world so easily available to Western musicians. It was thus no accident that the rise of the category of “world music” (to be discussed in the next section) occurred around the same time as the development of digital technologies and the compact disc. Digitization of music made it extremely simple for musicians not only to hear musics from other places, but also to incorporate recorded sounds of non-Western music into their own. Computer software was developed that made the incorporation of previously recorded music into one's own a simple matter, as easy as cutting and pasting in a word-processing application. A musician could sit at her computer and simply pop in a CD and extract what sounds she wanted, or, with a synthesizer, create “any sound you can imagine” (Théberge, 1997).

Sampling (this cutting and pasting of pre-existing music) has become so ubiquitous in the production of virtually all popular musics in the 1990s that libraries of sampled recordings began to emerge that would allow musicians to access vast collections of music to plug into their own if they wanted to give a sense of local color or some other signifier of the exotic. Whereas popular musicians once grappled with questions of genre or style, or with this sound or that, today's musicians increasingly think in extremely specific terms-digitized, atomized, cut-and-paste terms. For example, one electronic popular musician said that he stockpiles recordings to use as potential samples, “and when I'm working on a tune if I need a male Arabic vocal to fit a section I'll see if I have anything which would be suitable” (Marks, n.d.).²

But sampling is only one aspect of the massive and drastic changes that digitization has wrought into the production of music. Live musicians are increasingly unemployed, as digitized recordings or synthesizers replace them. Nowhere is this clearer than in the realm of the production of commercial music, which I have been studying extensively for over a decade. It is clear that, before the rise of digital technologies in the 1980s, musicians' roles in the commercial music realm were fairly confined, and therefore stable: one was a film music composer, a television music composer, a commercial composer (in a descending order of prestige that exists to this day), or an instrumentalist or singer, who could traverse these boundaries a little more freely. Most of these musicians would have had some classical training, or at least could read and write music and play an acoustic instrument. But the introduction of digital music technologies in the 1980s changed all that, for it was young musicians in popular music who were quickest to learn these new technologies and who were able to gain a foothold in the production of popular musics. Steve Karmen, one of the most successful commercial music composers in the 1970s and 1980s, writes of how a client inquired about the synthesizer he used, then told him that his 12-year-old son used the same machine. “When a twelve-year-old kid can produce the same

sounds as a twenty-five year pro,” Karmen writes, “it’s a sign” (2005, p. 178). Karmen left the business soon afterwards. Those who remain in the music industry have become much more flexible, in contrast to their immediate pre-digital forbears: they might play in a band, produce albums, engineer albums, make music for commercials, and more.

Many of the people I interviewed (for Taylor, 2012) said that what they missed most about the old days of advertising were the live recording sessions with musicians, most of whom are gone now, as so much can be accomplished by a single musician with digital equipment; and the same is true of the production of popular musics more generally. The sociability and synergy that composers, arrangers, and other musicians once encountered in recording sessions is absent. Nick Di Minno, someone long in the industry, recounted to me with some poignancy his attendance at a musician’s funeral and seeing other musicians with whom he once had daily contact in the studio, but whom hadn’t seen for years (Di Minno, 2009). Many musicians I spoke to said much the same thing, usually with palpable regret and nostalgia.

Musicians whom I interviewed also noted that a kind of sameness has crept into the sound. Some, like Tom McFaul, an important advertising composer, attribute this in part to the decline of live recording sessions – a decline that made the kind of synergy among live musicians impossible.

Using samples and synths also brought about a kind of sameness to the sound of ad music as it has done to pop music. With live dates, the exciting thing was that the personalities of the great players available always made the work distinctive. If our work was not about art, it was at least about craft and musicianship. (McFaul, 2009)

Yet another repercussion concerned, as always, money. Using synthesizers could be cheaper than live musicians. Spencer Michlin, a leading advertising composer in the 1980s, explains it very clearly:

Technology had made it possible for individuals to compete by recording music on synthesizers in their homes. This gave these writers a built-in economic advantage. Let’s say that a jingle needed a rhythm section and horns (piano, bass, drums, percussion, two guitars, three trumpets, and two trombones). Add in the union-mandated double scale for leader, plus a contractor and arranger at double scale and a copyist at scale, and that’s 18 units on the AFM [American Federation of Musicians] contract [. . .] Unless the composer was a complete pig [. . .] he or she could leverage that advantage by charging the equivalent of, say, nine units and cut the musicians’ budget in half money while keeping more of it. (Michlin, 2009)

Also, Michlin said that younger musicians probably weren’t union members (*ibid.*).

The digital music technologies, and the Internet too, as many people told me, made it possible for people outside of the major metropolitan centers to compete, and also made it possible for music production companies in New York and elsewhere

to hire musicians at a distance. Outsourcing, what some have described as an important aspect of the new capitalism, is affecting the culture industries as well.

Music in a Globalized World: The Rise of “World Music”

Let me now address the question of globalization in the new capitalism, paying particular attention to the rise of what has come to be known as “world music.” While many of the musics included in the “world music” category have been around for as long as people have made music, the emergence of this label in the late 1980s registered the increasing globalization and interconnectedness of cultures and economies around the world. Since the seventeenth century, the world had been interconnected (Wallerstein, 1974) through colonialism, trade, and other means, and, due to the widespread domination of much of the world by the West, many kinds of music from the West traveled around the world far more frequently than non-Western musics traveled to Western metropolises. But this began to change in the 1980s, as more and more countries around the world developed recording industries (Wallis & Malm, 1984), and as digital technologies made the dissemination of music much faster and easier. Record stores in Europe and the US were increasingly receiving shipments of recordings of music from beyond their borders; but it wasn’t the familiar traditional music that retailers had become accustomed to. It was music that sounded like Euro-American popular music but was different: different languages, different sounds.

Shelving this music – from Africa, India, South America, and elsewhere – in the old section labeled “International,” which was populated mainly by recordings of German polkas and ethnographic field recordings of African drumming or Javanese gamelan, made no sense to these retailers. So, in the summer of 1988, a group of English retailers and journalists gathered to debate a new term for labeling this music, and they settled on “world music” (see Denselow, 2004; Taylor, 1997). For a time, the more rock- and pop-oriented music was referred to as “world beat,” but this description proved to be less durable than the more general “world music,” which persists to this day.

Just as ideologies of the new capitalism infiltrated the world of cultural production, with the new importance of “creativity,” the hip and the cool, ageism, and more, new ideas about consumption also emerged. In a world suffused with goods, as Jean Baudrillard writes, ideologies of authenticity become more prevalent (Baudrillard, 1988, p. 170). In the early days of world music there was a good deal of discussion, in the critical press and among fans, about what was considered to be “authentic,” even though all or much of the music placed in this category was recognizably popular music of some form, which non-Western musicians had been hearing for decades through imports of recordings, cassette copies of them, and radio broadcasts.

Nonetheless, early on, the critical response to world music was to celebrate whatever was thought to be authentic and to condemn music thought to be overly influenced by Euro-American popular music.

In Taylor (1997) I identified three forms of authenticity that were common in the marketing and representation of world music of that era: authenticities of positionality, of emotionality, and of primality. These were interrelated ideologies that colored how Western listeners tended to hear music. The first was an ideology that expected non-Western musicians to be truly from the Brazilian *favela* or Indian slum or Australian outback or African bush; musicians with more than a modicum of educational and financial capital were seen to be not authentic enough in various ways, to the exasperation of many a musician. As the Beninoise singer Angélique Kidjo said:

There is a kind of cultural racism going on where people think that African musicians have to make a certain kind of music. No one asks Paul Simon, 'Why did you use black African musicians? Why don't you use Americans? Why don't you make your music?' What is the music that Paul Simon is supposed to do?' (Burr, 1994, §H, p. 28)

Elsewhere she said:

I won't do my music different to please some people who want to see something very traditional. The music I write is me. It's how I feel. If you want to see traditional music and exoticism, take a plane to Africa. They play that music on the streets. I'm not going to play traditional drums and dress like bush people. I'm not going to show my ass for any fucking white man. If they want to see it, they can go outside. I'm not here for that. I don't ask Americans to play country music. (Wentz, 1993, p. 43)³

The second type, what I called "authenticity of emotionality," refers to the kind of unfettered emotions that non-Western musicians are supposed to possess and to articulate in their music, as opposed to the overproduced and commercial orientation of music that is characteristic of Western popular music.

Lastly, authenticity of primality refers to expectations that non-Western musicians are closer to nature, to the earth, than Westerners – an ideology that goes back at least to the "discovery" of the New World. This belief was registered in the names of many an independent record label that sprung up in the 1980s and 1990s to offer world music such as EarthBeat!, Earthworks, GlobeStyle, Original Music, Real World, Redwood Cultural Work, Roots Records, Soundings of the Planet, and, in German, Erdenklang ("Earthsound").

These authenticities – or, more appropriately, these ideologies – are not confined to the realm of world music but circulate in Western culture more generally, though they found a particular valence in the realm of world music. Take the authenticity of positionality, for example: many readers will recognize how this particular ideology has surfaced with respect to the marketing and representation of hip hop musicians, whose street credibility is frequently part of their image; or concerns at

the height of Bruce Springsteen's fame about whether or not he was truly of the working class.

Interestingly, however, these concerns about authenticity didn't last long, and critics soon began celebrating the clever stylistic hybrid, often characterizing a non-Western/pop hybrid as "authentic" in much the same terms that had once been reserved for describing music thought to be truly authentic (Taylor, 2007). This is perhaps because ethnographic recordings proved to be not so popular with listeners, and also because aesthetic distinctions came to be more important: was the music good or not?

A striking example of the shift in the authenticity discourse of primality combining with ideologies of the hybrid remains *Welenga*, a 1997 collaborative album between Wes Madiko (a Cameroonian who goes by his first name only) and Michel Sanchez, one of the two musicians behind the highly successful "band" Deep Forest. This album is accompanied by extravagant prose that contains some of the long-standing underlying ideologies about non-Western musicians:

Having written his first traditional album (which only appeared in the USA), Wes was wary of facile and over-artificial associations, a form of white-gloved slavery that is at the heart of too many fashionable cross-cultural projects. He was, however, reassured by the sincere passion of Michel Sanchez, who for three years gave Wes his time and his know-how. The combination of the two spirits, the irrational Wes and the virtuoso Michel, was a fusion of fire and water, the meeting of a wild but fertile root and the gifted loving caretaker of a musical garden where Wes could flourish. (Liner notes to *Welenga*, 1997)⁴

The use of language that sounds politically correct, juxtaposed with old and familiar colonialist tropes – of African people represented as "irrational" and "wild," as well as of the largesse of the European musician – is striking here (for more on this, see Taylor, 2007, pp. 141–143).

Popularization of world music was aided immeasurably by the popular and critical success of Paul Simon's *Graceland* from 1986, which won a Grammy award for Best Album in 1987. Simon's work with Ladysmith Black Mambazo (a male chorus from the township of Soweto that had already garnered significant international attention), as well as with other African musicians, helped introduce non-Western popular musics to mainstream audiences, and it also helped Ladysmith Black Mambazo achieve the international audience it had been seeking.

Simon's rhetoric and practices around this recording were, and remain, emblematic of the kinds of maneuvers that famous Euro-American musicians have employed to justify their work with other musicians. Their discourses frequently employ a mixture of tropes of discovery and connoisseurship, statements of affection for the music, an aesthetics in the spirit of "art for art's sake," assumptions that non-Western music needed to be refined in some way, the importance of finding a local guide, and, sometimes, discourses of artistic rejuvenation.

Simon's many statements on the genesis of the album and its reception touch on most of these themes, forming almost a Rosetta Stone of the ideologies surrounding the perception of world music. In a documentary entitled *Paul Simon: Born at the Right Time*, Simon relates how he became interested in this music when he was at a low point, both in his public and in his private life.

When you have a career crisis and when you have a personal crisis, you can get thrown into a tailspin. And that's what happened then. And I began to come out of it when I began to get interested in South African music. I had this tape called *Gumboots: Accordion Jive Hits* which I was playing in my car for months.⁵ It's just an instrumental album. Then I noticed that I was singing whenever the album was playing. I was singing over it. (*Paul Simon: Born at the Right Time*, 1992)

Simon says that to be at a low ebb in his career was liberating, for it allowed him to do whatever he wanted. So he decided to go to South Africa to look for the music he had been listening to. He was forthright about his desire to jump-start his career: "People said 'Oh, he went to revitalize his career by using African rhythms.' I mean, nobody thought that was a good idea" (ibid.). After about a week into his first trip to South Africa in 1985, Simon met Ray Phiri, leader of the band Stimela, and says: "He was the key. Because he could lead me where I wanted to go. *Graceland* never could have been done without Ray" (ibid.). Referring to South African musics, Simon also says: "Culture flows like water. It isn't something that can just be cut off" (quoted by Herbstein, 1987, p. 35). Later, when speaking of the album that followed *Graceland* – his *The Rhythm of the Saints* – Simon says: "The act of discovery becomes what the work is about" (*Paul Simon: Born at the Right Time*, 1992).⁶

While Simon's discourses about *Graceland* and *The Rhythm of the Saints* provide particularly rich sites for unearthing underlying ideologies surrounding the appropriation of world music by Euro-American musicians, many musicians employed these tropes in various ways. Album art would include photos of intrepid musicians "discovering" world music (a verbal trope employed by Simon), or "primitive" musicians juxtaposed with pieces of Western technology such as headphones or microphones; or they would depict these musicians in recording studios. Some construed local musicians as "guides," as did Paul Simon vis-à-vis Ray Phiri. And non-Western musics were always naturalized, as in Simon's comment about culture flowing like water.

Once world music became a recognized part of the market (however small – it doesn't rate separate sales figures in the annual tally by the Recording Industry Association of America, which keeps track of such things), a process began – as it must under capitalism – of defining, delimiting, and demarcating it. In today's consumer culture there are tremendous pressures for standardization. Everyone is familiar with this when the product is an automobile or a fast food burger; but in the realm of cultural production the question becomes more complicated. Even though new genres of music always seem to proliferate – demonstrating a seeming fecundity

of production – the music industry is constantly seeking ways to clarify and simplify: it is always necessary to know where to shelve the recording, when to program what music on the radio and on what kind of station, where to organize the music online, and the like. Genericization occurred not as the result of racism or xenophobia, and not even of ignorance, but because the Western music industry sought to turn this vast collection of the world’s musics – from Indian ragas through Persian songs to the most recent popular music from Africa or India – into a manageable “genre,” within which certain “styles” could be codified.

Another reason for this genericization was the rise of the music supervisor in the 1980s, discussed above: this was part of the growing use of preexisting music in film and broadcasting. Various tools sprung up to help music supervisors and others in the music industry to find music suitable for such usages. One such tool was Sonymusicfinder, which allowed users to search for music by genre, style, and mood (mood being an all-important feature of music in film and broadcasting, as it underlies the story and images; see Taylor, 2012). World music was listed as a “genre”; the list of “styles” that appears in the pulldown menu contained, first, geographical regions (excluding North America), and then “styles” (see Table 6.1).

Many of these more obscure (or unusual) “styles” had few recordings associated with them. For example, searching for “Avant-Garde” without inputting a mood resulted in only Tan Dun’s homage to Peking opera: *Bitter Love* (1998). Searching in a similar way for the “style” called “classical” resulted only in *A Nordic Festival* (1991),

Table 6.1 List of world music styles from Sonymusicfinder.com

Central Asia	Country-Rock	Orchestral Pop
Eastern Europe	Dance-Pop	Progressive Bluegrass
Far East	Ethnic Fusion	Qawwali
Mediterranean	Euro-pop	Rock & Roll
South Asia	Flamenco	Rock en Español
Western Europe	Folk Songs	Salsa
Worldbeat	Foreign Language Rock	Samba
Afro-Cuban	French Pop	Tango
Andean Folk	Hip-Hop	Tejano
Avant-Garde	Indian Pop	Tex-Mex
Bachata	Italian Folk	Third Wave Ska Revival
Big Band	Klezmer	Traditional Chinese
Bolero	Latin Folk	Tropical
CCM (Contemporary Christian Music)	Latin Jazz	Vocal Pop
Cha-Cha	Latin Pop	World Fusion
Charanga	Mariachi	Worldbeat
Christmas	Merengue	Zouk
Classical	Norteño	
Country-Pop	Opera

with Esa-Pekka Salonen conducting the Swedish Radio Symphony Orchestra as it performed compositions by well-known and not so well-known Scandinavian composers. “Country Pop” resulted in a handful of songs sung by singers such as Willie Nelson, George Jones, and others – hardly world music; “Country Rock” yielded a single album, *Poco* (1970), by Poco (this discussion is from Taylor, 2007, pp. 191–194). Interestingly, however, these sorts of tools were underused; professionals in music and broadcasting prefer to hire music supervisors than to search for music themselves, and music supervisors usually use iTunes and YouTube to find music.

With the rise and subsequent genericization of world music, people with new skill sets have sprung up. The demands, in the 1980s and early 1990s, for “authenticity” in world music have given way to a market that rewards the individual singer who can mimic any sound – that is simply cheaper and more efficient than finding an actual practitioner of a particular musical tradition. I have talked to singers who specialize in singing vocal parts in films, in television shows, and in commercials, who speak of the importance of knowing how to sound like whatever the producer wants. One told me that, when she is emulating an African American singer, she is frequently directed to sound “a little more white”; when she imitates a singer, she might be told to sound “three years older” (Steingold, 2009). When representing a non-Western style, she could be told to sound “less ethnic.” Another singer told me he has a vast personal library of recordings that he references when he is asked to sing in an unfamiliar style (Crenshaw, 2009).

One of the things that the rise of world music made clear is that old assumptions about the nature of the middle class and its tastes began to shift. World music is associated with a certain portion of the middle class: Bourdieu’s (1984) “dominated dominant” group – in other words, people with high amounts of educational and cultural capital but not with financial capital. Demographic data compiled by record labels revealed that world music customers were highly educated and probably multilingual (see Taylor, 2007). This is perhaps not surprising. Surprising is the realization, in the last couple of decades, that dominant groups’ tastes in music have shifted, in part because of the looming presence of baby boomers in the overall population – a demographic that has tended to remain faithful to the music of its youth rather than ageing away from it (thanks in part to advertisers’ relentless targeting of this demographic group; see Peterson, 1992, 1997; Peterson & Kern, 1996; Peterson & Simkus, 1992; Taylor, 2009).

Unlike some (e.g., Sklair, 2001), I have been reluctant to argue that there is a new social class in the new capitalism. I remain enough of a Marxist to think that capitalism produces its forms of dominant and subordinate groups, in a structure that has proved to be quite durable – it is rather the nature of these groups that has changed over time, changing also with the new capitalism. And, as we learned from Bourdieu (1984), with changes in the social structure, peoples’ tastes change. Particularly in this capitalism, which is more culturalized than in earlier moments of its history, the makers and shapers of culture – in this case, the new petite bourgeoisie – can promote their tastes

over the culture, through broadcasting and filmmaking, thus influencing consumption. Indeed the oversized role that the advertising industry plays in cultural production today, and its long infatuation with youth, the hip, and the cool (see Frank, 1997), have meant that long-standing cultural hierarchies are shifting. Cultural capital in Bourdieu's sense accrues less and less to those with knowledge of the fine arts and increasingly to those with knowledge of the hip and the cool (Taylor, 2009).

Conclusions

Writing about the present time and the recent past, as I have done in most of my work, makes it difficult to resist thinking about the future. It is not easy to be optimistic. The plethora of musics available means that finding a way through them will continue to be important, both for consumers (including music supervisors and advertising agency workers) and, of course, for musicians. But the predictions implicit in the early songs of praise about the Internet and its implications for musicians have, by and large, not come to pass. It is true that musicians can more easily distribute their music than they could in the past – but distribute it to whom? Identifying and exploiting markets is, increasingly, the main enterprise of the music business, or what remains of it. In any event, it is still out of the reach of virtually all the musicians who simply want to make a living by making music.

And, as great as my debt to Marxian studies of capitalism is, and as helpful as periodizations of capitalism are in attempting to come to grips with its multifarious and ever-adaptable nature, it is difficult today to imagine writing of its final phase, its obituary. Anthony Giddens once wrote of modernity as a juggernaut (Giddens, 1990), but it is capitalism that is in the driver's seat. All we can do is hang on and hope to find some good tunes on the radio along the way.

NOTES

- 1 For an overview, see Harvey (1985); for trenchant critiques, see Ferguson (2002) and Klein (2008).
- 2 For more on this ideology of sampling, see Taylor (2001).
- 3 At the same time, as Louise Meintjes (2003) has shown, some non-Western musicians such as those South Africans she studied increasingly make music aimed at an international audience.
- 4 I would like to thank Harriet Whitehead for introducing me to this album.
- 5 Ray Phiri, one of the main South African musicians on the album, said that Simon's copy was a bootleg version from London and that Simon had no idea about what the music was or where it was from, and he solicited the aid of his record company, Warner Bros., to track down the source (Mgxashe, 1987, pp. 31).

- 6 Despite the recording's popularity and critical acclaim, the album was nonetheless controversial, for Simon violated a United Nations boycott against South Africa and, in addition, many listeners both in and out of South Africa heard the album as yet another instance of White appropriation of Black music, or of European/American exploitation of Africa. Simon's statements on this controversy continue the rhetoric he had employed throughout the project: that he was helping the musicians get their music known, that the South African music is nothing but good tunes, and that musicians themselves do not employ criticisms based on politics (see Moerer, 1991).

Whither the Professional Book Publisher in an Era of Distribution on Demand

Laura J. Miller

ABSTRACT

This chapter examines changing organizational, economic, and cultural practices of book production by analyzing the breakdown of several once firm distinctions in the book industry: between production and distribution; between professional publishing and self-publishing; and between amateur and commercial authorship. The development of online storefronts that sell physical books, electronic devices that make it possible to read digital books, and a focus on content as intellectual property that can be detached from form have made it easier than in the past to bypass professional publishers and their traditional roles as gatekeepers, editors, and coordinators of the book production process. The result has been a huge increase in self-publishing, a phenomenon facilitated by for-profit companies that provide a mechanism for distributing these books. The argument is made that the growth of self-publishing reinforces a shift in power relations within the book industry, from publishers to distributors, and helps to make authorship into a recreational choice that can be purchased.

Prophesying the end of the book, a perennial pastime ever since the advent of television, has intensified in recent years. For decades, observers had warned that young people do not choose to read, being too distracted by other, primarily electronic, diversions that eat into what little unscheduled time they have left. But now we are hearing that adults, too, are giving up on books, at least of the print variety (Birkerts, 1994; National Endowment for the Arts, 2004, 2007, 2009; Scholastic & Harrison Group, 2010). Along with the continued demise of bookstores, the explosion of devices that allow book-related content to be read in digital form, from dedicated e-readers to smart phone apps, seems to signal that the nearly six-century reign of the printed book form as a dominant medium of communication is coming to a rapid end (Gomez, 2008; Siegler, 2010; Weeks, 2000).

Despite some very real changes in book-consumption habits, pronouncements about the death of the printed book are highly overdrawn. After all, by the middle of 2011, only approximately 14% of books sold in the United States were electronic books (Milliot, 2011). And, as is frequently noted, the printed book, as a piece of technology, has many advantages. It does not need electricity. You can drop it or dirty it without impairing its functionality. Entry costs are low. One can flip back and forth rapidly between pages. And, once purchased, it is fungible in ways that most e-books presently are not. But, more than simply being a piece of hyperbole, attention to the health of print diverts us from equally (if not more) important changes taking place in the world of books. Instead of a single-minded focus on technological form, we should also be looking at what is happening to the process of production. That is, in what ways are the organizational, economic, and cultural practices associated with book production changing? We may not be seeing the end of the book, but are we witnessing the death of the publisher?

This chapter approaches the two questions formulated above by examining the breakdown of several once firm distinctions in the book industry: between production and distribution, between professional publishing and self-publishing, and between amateur and commercial authorship. From the nineteenth century right up until the early twenty-first century, the typical structure in the book industry included a division of labor whereby the publisher acted as the master coordinator, acquiring manuscripts from authors, arranging for them to be manufactured by printers, and determining availability to booksellers, who then sold books to the public. As such, publishers not only acted as gatekeepers who decided what works would get published and what would remain locked away in a would-be author's drawer, but publishers were also responsible for editing, design, publicity, and pricing. The costs of such basic tasks as typesetting and warehousing books, and the sheer complexity involved in navigating a system where, by the middle of the twentieth century, hundreds of thousands of unique titles competed for the attention of geographically scattered book retailers and the reading public, meant that professional publishers were best equipped to oversee and finance the publication process, though not without a considerable degree of inefficiency.

However, the development of different mechanisms for producing, distributing, and receiving books has destabilized this publisher-centered system. Many of these

developments are not entirely new. Desktop publishing, which arrived in the 1980s (Henry, 2009), allowed anyone with a computer and widely available software programs to do attractive book design, and it helped to fuel a vibrant small press movement. Starting in the 1960s, the growth of major bookstore chains and bookselling mass merchandisers created powerful retailers, who came to exercise considerable influence over their publisher suppliers (Miller, 2006). And, for decades, freelancers made available a wide variety of editorial, marketing, and production services, especially useful for small publishing outfits that could not afford to keep a full complement of specialists in the house (Dessauer, 1974, p. 166; Mogel, 1996, pp. 21–23). But, more recently, online storefronts that sell physical books and electronic devices that make it possible to read digital books have made it easier than in the past to bypass traditional publishers altogether. One result has been a huge increase in self-publishing, which is no longer denigrated as vanity publishing – a phenomenon facilitated by for-profit companies that provide a mechanism for distributing these books.

These developments call into question the role that publishers play: they appear to be rearranging the power dynamics in the book industry. In a rapidly expanding marketplace – where, in 2009, 288,355 new titles and editions from traditional publishers were released in the United States, while over twice as many came from non-traditional sources (primarily print on demand and self-publishing) (“Big Gains for New Players,” 2010) – there are fewer cues for distinguishing the edited from the unedited book, the anointed from the self-appointed. While some see all this as a populist triumph whereby any writer can transition to the status of published author without the permission of established publisher authorities, I want to argue that other for-profit players – some new, some veteran – are consolidating their positions of influence in the competition for readers’ attention and dollars. For, at the same time as we see a lessening of regard for what professional publishers do and heightened cultural approbation for the status of the amateur author, those authors are becoming dependent on professional distributors who act behind the scenes to make works available in an increasingly crowded book arena. Book authorship comes to look similar to book readership, in that both are recreational choices that one can purchase from commercial entrepreneurs. The weakened position of professional publishing may thus transform the way in which the public thinks about books as much as technological developments do.

Publisher Organizations and Responsibilities: Twentieth-Century Shifts

At least until the twenty-first century, the would-be author who produced a manuscript faced a daunting task in getting his book into print. Already established authors whose futures appeared promising might well receive advance payments on little more than an idea pitched to an editor. For the unknown writer, on the other hand, not only were fat advances unlikely, but so was the very possibility of being published.

In 1981 it was estimated that the odds against the publication of novels submitted unsolicited or without the benefit of an agent were 29,998 to 2 (Coser, Kadushin, & Powell, 1985, 132). In their classic study of the American publishing industry, on the basis of research conducted in the 1970s, Coser and his team found that an individual editor received between 1,000 and 5,000 unsolicited submissions each year (p. 129). When measured against the amount of labor it took to go through the “slush pile,” the likelihood of finding something worthwhile was considered so low that most unsolicited manuscripts were never even looked at (Dystel, 1985, p. 335). This still remains the case today.

Instead, during the second half of the twentieth century, the editor came increasingly to rely on literary agents to screen writers for her and to bring to her attention books that fit her press’ profile. Today the majority of published books first come to an editor’s attention via an agent, though securing an agent’s services does not guarantee publication. Augmenting their more obvious duties as dealmakers, agents also gradually took on functions that were once the editor’s exclusive prerogative: advising an author on book ideas and writing style, on the kind of audience to target, and on the progression of a writer’s career. In part, the agent engages in these activities because writers cannot necessarily count on an editor’s long-term guidance. Editors change jobs with great frequency, so that an author not uncommonly finds that an editor who enthusiastically accepted his manuscript for publication does not stay long enough at the publishing house to see the project through to its completion. With such great uncertainty clouding the author–editor relationship, the agent often becomes a welcome and stable mentor. On the flip side, the author–publisher relationship became more formal and contractual over the twentieth century (Berman, 1983; Squires, 2007, pp. 34–35).

In addition to the ways in which editors interact with their authors, there have been other changes to the organization of publishing that undermined the centrality of the editorial function. A key development was the transformation, during the second half of the twentieth century, of the largest publishers from family-owned firms to investor-controlled corporations, which were usually public and often part of diversified conglomerates. Several waves of merger and acquisition activity produced over time a handful of companies that were based primarily in Europe and North America and controlled hundreds of the best known publisher imprints (Greco, Rodríguez, & Wharton, 2007; Luey, 2009; Miller, 2006, 2011; see Table 7.1 for examples of different permutations in publisher ownership). Complaints about commercialization in the book world have been a staple as long as the modern book industry has existed, but they took on an intensified tone in reaction to corporatization. Critics charged that publisher consolidation was leading to an aversion to risk-taking and to a homogenization of book output. Additionally, critics said, publishers overemphasized the promotion of popular blockbusters, with the result that most other books were set up for market failure (Miller, 1997; Schiffrin, 1995; Solotaroff, 1984). For many who worked in publishing, the introduction of more rationalized techniques for managing the business turned what was once a quirky and inefficient

but fulfilling line of work into something more modern, but also less enjoyable (Howard, 1989; Schiffin, 2000).

The 1980s in particular were marked by tremendous discussion and concern about the increased importance, in publishing houses, of marketing and subsidiary rights, some of this debate being prompted by the publication of Thomas Whiteside's *The Blockbuster Complex* in 1981 (Donaldson, 1981; Whiteside, 1981; Woodcock, 1981).¹ Pushed by their corporate parents to pay more systematic attention to revenue streams, publishers appeared to be elevating once secondary departments to equal status with that of editorial divisions. Along with their obvious responsibilities of selling, promotion, and publicity, sales and marketing members of staff are now often consulted on the sales prospects for a book, even when an editor is deciding whether or not to acquire a manuscript. Marketing considerations are also critical in determining the number of copies to be printed, the choice of a title for the book, the quality of art-work to be commissioned, the jacket design, the scheduling of a book's publication, and the setting of the book's price. Thus marketing matters are intimately connected to editorial and production decisions at almost every stage in the book's development. For critics, this has meant that those books and authors with media appeal or with an obvious promotional hook are favored over books that are not so easily marketed. While there is considerable truth to this claim, it does not really address the thornier question of just how publishers should make decisions about the amount of marketing to put into any single title. In a bookselling landscape where there are now over three million books in print in the US alone (R. R. Bowker, LLC, 2011, p. viii), marketing is both essential to helping a book find its audience and self-defeating – in that the cacophony of promotional messages soon overwhelms even the most receptive reader.

Similar concerns about how publishers evaluate and treat manuscripts differentially have been associated with the issue of subsidiary rights. For much of the twentieth century, the typical model in publishing was for manuscripts to be published first in hardcover form. The right to transform the book into another form is considered a subsidiary right and is usually licensed by the original publisher to a different organization. Paperback reprint, book club, foreign and territorial, translation, magazine serialization, film, television, and stage adaptation, audio, and electronic rights have been among the most common kinds of rights. As the value of these rights grew over time, publishers increasingly considered a book's prospects for rights-generated income when doing the original hardcover publication. This not only prompted critics to claim that books without much potential for subsidiary rights were being unpublished or left to languish with no promotional attention, but it also led to a dismantling of the traditional sequence of events, whereby hardcover books are published first, and any other form is subsequent or subsidiary. As it became clear that a paperback original did not need the cachet of a hardcover preceding it, or that a successful children's book series could be created out of a television series, the once automatic association between a book and a standalone hardcover was being dissolved. Content was becoming detached from form.

These various changes were, if not altogether caused, at least facilitated by the connections between publishing and major media conglomerates. However, what is often glossed over in accounts of publisher consolidation is that the various waves of publisher acquisitions were interspersed with periods of divestment, as corporations whose primary purpose was not in book products realized that book publishing both was a low-profit endeavor and operated according to very different traditions from those of their core activities. Indeed, the era of book publishers as subsidiaries of massive media conglomerates seemed to come to an end in the 2000s: Vivendi Universal sold Houghton Mifflin to an investment group consortium in 2002, Time Warner sold the Time Warner Book Group to Groupe Lagadère Media in 2006, and Viacom split off CBS (initially, Columbia Broadcasting System, owner of Simon & Schuster Book Group) also in 2006 (Miller, 2011). These signs of disenchantment with publishing properties were perhaps a foreshadowing of the general value that the market could come to place on traditional publishing.

The Rise of Self-Publishing

Whereas the publishing industry appeared to be in a perpetual state of turmoil in the twentieth century, it has faced new challenges in the current century. Most recent studies have framed their analyses of the future of publishing and reading in terms of the digital age and its features, which include the competition and opportunities presented by electronic information and entertainment delivery systems (Cope & Phillips, 2006; Darnton, 2009; Epstein, 2001; Kovač, 2008; Striphās, 2009; Thompson, 2005). I wish to examine these challenges, not by ignoring new technologies – which, as I will discuss, definitely affect all stages, from production to reception – but by considering them alongside two other tendencies: the focus on content as intellectual property that can be detached from form; and the rise of a number of powerful distributors. These tendencies are not unique to the book industry. Fluid interrelationships between technology, distribution, and intellectual property have affected all communication industries, from recorded music to television to film to newspapers (Croteau & Hoynes, 2006; Gillespie, 2007; Hesmondhalgh, 2002). But, because of different cultural traditions in the production and reception of these various media, the ways in which they have been impacted by recent developments are not uniform.

The specific case I use to discuss these developments is the extraordinary growth and cultural legitimization of self-publishing. Not so long ago, self-publishing was generally called vanity publishing: a telling name, in that the notion of paying for one's writings to be published, regardless of their merit, was seen as an act of pure vanity. In recognition of the social stigma that accompanied vanity publishing, most firms that made it possible operated with discretion, giving a book all the trappings of having been acquired by what was considered truly legitimate publishers. Of course, well before the current era, the line between legitimate and vanity publishing was

never perfectly clear. For instance, the not uncommon practice of scholarly publishers favoring a subvention – a subsidy that an author, or an author’s institution, brings to defray the costs of production – has meant that those authors with access to such funds could have an edge in getting published, though books still have to go through the usual channels of evaluation before a contract is offered (Horowitz, 1991, p. 170; Powell, 1985, pp. 185, 230). Similarly, many a small press has successfully begun with a publisher–author’s own book as the centerpiece of the new list. In other cases religious, political, and voluntary bodies simply found it easier to self-publish works that were primarily meant for their own constituents’ consumption than to find a separate press, which was willing to work with them on their terms. All such cases cast doubt on the somewhat sanctimonious ideal of an objective publisher, who dispassionately evaluates the merits of a manuscript and who profits only when an independent book-buying audience endorses his or her judgment about a book’s worthiness. Nonetheless, despite the dubious proposition that regular publishing was synonymous with a meritocracy, those other publishers who accepted any and all comers for a price and those authors who availed themselves of this opportunity were recognized by both the book industry and the reading public as different and as subject to disdain.

What kept this distinction between regular publishing and self-publishing vital was a combination of two things. First there were ideas about the legitimacy of cultural authorities in the form of professional publishers, who were granted the exclusive right to make determinations about the quality (in terms of both literary and commercial values) of manuscripts. And second there was a considerable consensus about the indicators of being a certified published author. This not only entailed the physical properties of a properly printed and bound book, but it also included the ability for readers to purchase the book. And, for that, it was almost essential to engage with a professional publisher, someone who knew how to “announce” the book, for instance by securing an International Standard Book Number (ISBN) or by sending catalogs to key intermediaries who could publicize a title to the book-buying public. It was the professional publisher who could convince booksellers – whose limited bookshelf space required them to exclude most available books – to carry a given title.

Today, however, these conventions regarding the designation of a published book are breaking down, as the options for manufacturing, publicizing, and distributing books have grown more numerous. Such conventions have been loosened in a number of ways. The physical form of a book is no longer synonymous with a printed and bound codex of a standard length. Content that was created for other purposes – for instance a blog, a wiki, the back story of a video game – can now be readily transferred into book form. Moreover, individuals and organizations other than traditional publishers may control and coordinate those steps taken to make a book available to the public. An important catalyst for undermining consensus on what constitutes a published book has been a number of new technologies that affect each stage in the process of getting a book from author to reader.

Among the more significant changes in manufacturing is print on demand (POD), developed in the 1990s, which replaces offset printing with digital printing technolo-

gies. In offset lithography, printing is done from plates, which hold the image that is to be printed onto sheets of paper. This process produces consistently high-quality printing, but it is also expensive to prepare and make the plates. For that reason, the higher the print run, the more units there are across which costs can be distributed (Henry, 2009). Very small print runs are simply not cost efficient. But when one prints directly from a digital file, as POD does, it is feasible to print even a single copy – hence the phrase *print on demand*. Printing only when a copy is requested by a buyer can also save producers money, because there is no excess stock to be housed in expensive warehouse space for years on end. As the quality of digital printing has improved dramatically, book readers are less likely as much as to notice its difference from offset printing.

While POD can be used for short-run jobs of traditionally published new books, in practice it has primarily been used in three ways. First, publishers will reprint a small number of an out-of-stock book for which they do not anticipate sufficient demand to justify a full reprinting. The second use is to publish inexpensively small runs of books in the public domain – a way for POD companies to sell directly to consumers without becoming full-fledged publishers who acquire and edit new material. And, third, POD is a boon to self-publishing, as authors do not have to pay for an extremely expensive printing job to produce books that may be distributed no further than one's small circle of friends and family.

With each of these uses, the impact of POD has also been to make traditional publishers less central to the publication process. Some of the earliest ventures to commercialize POD services were started by the major wholesalers in the book industry, Baker & Taylor and Ingram. Unlike publishers of the time, these wholesalers invested in the equipment that produces POD books and that could convert older titles to a digital format (“Update on Printing-on-Demand,” 1998). The advantage, for both publishers and booksellers, of working with Ingram or with Baker & Taylor was that these already had in place systems for ordering delivery of books from the wholesalers. POD services became even more decentralized with various “book machines” – the name given to POD devices that can print, bind, and trim books and that, theoretically, can be set up anywhere. While at one time there was speculation that these devices could become as mundane as a vending machine, the expense of purchase and the difficulty of maintaining them in working order have limited their spread. Nonetheless, some bookstores have acquired one such machine, which makes it possible for a bookstore to be a center of book production as well as of book consumption. Booksellers have found that much of the customer demand for these machines comes from writers who print their own manuscripts (Mayersohn, 2011; Rosen, 2006).

While some bookstores have experimented with this kind of book manufacturing, the very definition of bookselling has been complicated in other ways by digital distributors. In the mid-1990s, entrepreneurs, some with no previous bookselling experience, began selling books online. The major player, of course, was Amazon.com, which became a significant presence in bookselling markets around the globe.

However, anyone with a website, packing materials, and access to books to sell can set oneself up as an online bookseller, utilizing the postal service or a private delivery company to get physical books into the hands of readers who purchase them. Although there is indeed a multitude of very small operators trying to sell books – especially used ones – out of their own homes, more developed online businesses rely heavily on wholesalers to warehouse books and fill orders. Amazon is an exception to this; because of the volume of its sales, it maintains its own set of warehouses.

The effects of online bookselling in the field have been multifaceted, but a few in particular bear mentioning here. To begin with, the growth of Amazon contributed to the decline of independent bookstores and to the concentration of clout around a small number of businesses involved in bookselling. In addition to Amazon, this group included Barnes & Noble, Borders (which went out of business in 2011), and Wal-Mart in the US; Waterstone's, Tesco, and Asda in the UK; DBH and Thalia in Germany; and Fnac in France and elsewhere in Europe. Because they are responsible for such a large portion of book sales, these retailers have been able to wield considerable influence over publishers, which is manifest in everything – from the terms according to which publishers sell books to them to marketing plans for a given title. Even when publishers feel taken advantage of, they can rarely afford to alienate their biggest customers. Thus publishers' relative power in the industry has diminished as that of the major retailers and distributors have grown.

Second, online bookselling makes it theoretically possible to sell an unlimited number of titles, since what browsing customers see is a listing of books, not the actual books themselves. It should not be forgotten that the capability to purchase any book in print was available before the Internet came on the scene, as booksellers kept copies of the reference works that listed all books in print available in the store for their own and their customers' use. Many bookshops would order for a customer any book that they do not already carry (most still do this). However, consumers have not always been aware of this service, and the ability to instantly call up titles on one's home computer screen, without a human bookseller acting as an intermediary, contributes to the sense of plenitude that online bookselling brings. It can make the physical limitations of bookstores seem like an unnecessary impediment to consumer choice.

Finally, and connected to this, without the scarcity issue presented by the simple impossibility of a physical bookstore housing all the available titles, self-published books that formerly would never have had a chance of being displayed in a bookshop can easily be included in an online bookseller's database. This makes it at least possible for such books to reach a wide audience. But doing away with limitations on the number of titles that an online bookseller "carries" does not do away with limitations on consumers' patience for sorting through the massive quantity of books vying for their attention. Nor does online shopping do away with the fact that Internet booksellers with large databases still make choices about which titles will feature in prominent ways on their web pages and which titles will come to a reader's

attention only if she conducts the exact right search (Miller, 1999). As a consequence, booksellers like Amazon have realized that there are revenue streams to be tapped by allowing publishers to purchase advantageous placements on the website.

Along with changing manufacturing and retailing, digital technology has also provided new options for book reception. The first attempt to find a mass audience for electronic books emerged in the late 1990s, when several dedicated e-book reading devices started to come on the market, and numerous new companies and subsidiaries of existing companies tried to provide a means for making content available. However, while greatly hyped in the early days, most of these ventures did not last for long. Readers showed little interest – not only in paying for e-books, but in reading them at all. This was underscored by one of the most highly publicized early efforts to encourage e-book reading: the exclusive electronic publication, in 2000, of popular horror writer Stephen King's novella *Riding the Bullet*. Hundreds of thousands of people did download it, but there was quite an incentive to do so, since the e-book was initially available free of charge (Scott, 2000). On the other hand, it was estimated that only 20% of the downloaders actually read the book ("E-Books: Not Ready for Prime Time?" 2000). King ended up discontinuing his second experiment with e-books, *The Plant*, which bypassed regular publishers and was instead released in serialized installments on King's own website. By the fifth installment, downloads were down to one third of the number of the first installment, and fewer than half of those readers were making the voluntary one-dollar payment that King had requested for each download (Kirkpatrick, 2000; Reid, 2000). The aborted experiment suggested that even the most popular authors needed the marketing assistance of professional publishers, and that authors used to being paid handsomely for their work were not going to sit by passively and watch downloaders become freeloaders.

By 2001 e-books looked to be on their way out. In response to poor sales, e-book companies shut down, publishers discontinued e-book imprints, and booksellers stopped selling them (Milliot & Reid, 2002; Reid & Holt, 2003). As digitization was proceeding in other parts of the book business, though, research on electronic reader technology continued as well. By 2005 there were signs of an e-book revival, though its future still appeared tentative until 2007; that year Amazon introduced the Kindle, which provided a reading experience much improved over that of the previous generation of e-book devices. Other companies soon followed with their own e-book readers, and Sony, Barnes & Noble, and Apple joined Amazon as market leaders. At the same time, e-books that could be read on a regular computer or on a smart phone were also being made available. The result was a confusing landscape of businesses, some selling e-books in various formats, some selling e-book readers, and some selling both, while publishers who held the rights to previously published content that could be digitized needed to make individual deals with each company that used a proprietary e-book format. As it appeared that e-books would finally enter the mainstream, publishers also found themselves in disputes with authors and authors' agents about control over electronic rights.

Thus e-books hold out the promise of new sources of revenue to publishers, but they also threaten publishers' standing in the book industry. A major problem that publishers face has to do with the pricing of books. Amazon originally discounted its e-books to a price below the cost of acquiring them from publishers, as it was willing to take a loss in the hopes of convincing more readers to purchase a Kindle and of gaining market share; customers quickly came to see the discounted price as the "real" cost of a book. For consumers, the almost magical ease of digital reproduction contributes to the notion that "information wants to be free" – a phrase originally uttered by Stewart Brand when he described the paradoxical situation whereby information can be expensive because it is so valuable, but also cheap because the costs of dissemination keep declining (Turner, 2006, p. 136). The consequence of focusing solely on the lowered (though hardly absent) costs of distribution is that the costs of production are largely overlooked. Book publishers are now faced with a consuming public suspicious about the price of print and electronic books alike, and less confident that publishers actually do much to justify the prices they charge, especially for hardcover books. The e-book phenomenon, on the other hand, has benefited self-publishing. Not only can self-published authors avoid the costs of printing and shipping physical books, but the efforts of professional publishers look increasingly superfluous to writers and readers alike.

Professional Facilitators of Amateur Publishers

The development of digital technologies, the ease with which content can travel across various forms, and the decentering of professional publishers in the industry have all therefore aided the growth of self-publishing. But authors are not truly getting books out all by themselves. A number of companies that offer self-publishing services have been established to facilitate this process. The world's largest such company is Author Solutions, which owns AuthorHouse, iUniverse, Xlibris, Trafford Publishing, and Wordclay. Other major players include Lulu and Amazon's CreateSpace. As well as offering an Internet storefront for selling books, these companies present authors with a smorgasbord of services, from line editing, formatting, cover design, and illustration selection, to marketing campaigns and book-signing assistance, to ghostwriting. Authors can choose between electronic and print formats for publication. The mix-and-match nature of these services means that authors can spend as little or as much as they like. In 1982, fees for vanity press publishing in the US ranged between \$3,000 and \$20,000 (McDowell, 1982). In 2010, authors were paying self-publishing companies much less: an average of \$1,000 to \$5,000 (Byle, 2010, p. S8) – though more expensive packages were available. Indeed, it was possible to spend as little as \$100 if an author needed just a single service. Some Internet sites even allowed authors to upload an already prepared e-book for no charge, and then they would simply take a large share of the revenues if copies were sold. As this

indicates, it is possible for authors to do much or all of the production work themselves. But where authors are still in a position of dependence is in the area of distribution and sales.

Of course, the ease with which one can now publish a book does not mean that such books will sell. In 2009, Author Solutions estimated that its published titles sold on average 150 copies (Rich, 2009). For many authors, achieving significant sales is not the point of their endeavors. They may want to make copies available just to friends, family, or business associates, or they may want nothing more than the tangible product of their writing labors that publishing brings. But, for other authors, the hope is that their works will indeed find a larger audience and make the author some money in the process. Recognizing this market of ambitious self-publishers, established booksellers have begun to sell opportunities for exposure, as well as some services similar to those that the self-publishing companies offer. For instance, in 2009, retailer Barnes & Noble acquired Tikatok, an Internet site that, for a price, assists parents and children in publishing their own books ("College Stores, E-Commerce Boost B&N," 2009). The following year Barnes & Noble launched PubIt!, which allows self-published e-books to be sold through Barnes & Noble's Internet store ("B&N to Launch PubIt!" 2010). The program makes one of the largest online booksellers in the world accessible to authors who previously could never have hoped to sell their books there. The catch was that Barnes & Noble would retain 35–60% of the listed price of books sold. This ensured that Barnes & Noble, while doing almost none of the work involved in publishing a book, would profit from those few authors who made real money from their books. Similarly, both Borders and Amazon created programs that offered self-publishing services, marketing support for self-published works, or simply a place on their websites where self-published books could be sold. In this way these booksellers allow for distribution on demand.

The proliferation of commercial services for self-publishing has been accompanied by a remarkably rapid change in the social status of such books. Relatively few of those books are actually being read by people outside of the author's circle of acquaintances. Whether publication is a private affair or something done in the hope of achieving commercial success, self-publishing is more likely to be applauded as a legitimate act of self-expression and less likely to be denigrated as a foolish act of hubris than it was in the past. Signs of changing attitudes can be found even in more traditional sectors of the book industry. Agents are now looking for self-published works that can be transitioned to the professionally published market. Booksellers are changing their policies too. Previously, physical bookstores would rarely consider carrying self-published works, both because of the time and extra labor involved in handling non-traditional publishers and because such works had not been vetted according to traditional standards. But in 2007 Colorado's Boulder Book Store began charging self-published authors a \$25 handling fee to stock a book, and additional fees for other promotional opportunities. The program was considered successful both for the store and for authors, and other independent bookstores began to imitate

it (Rosen, 2010). This represented not only a change in regard for self-published books, but a greater willingness to sell display space in stores to publishers, an issue that has long been a source of debate in the industry.

Even *Publishers Weekly*, the venerable American trade journal of the book industry, has changed its stance towards self-publishing. In 2010 the magazine announced that it would begin issuing a quarterly supplement of self-published titles. Authors could pay a \$149 processing fee to have their titles listed in the supplement. The magazine also said it would review at least 25 of the listed titles in each supplement, promising the chosen authors the kind of exposure that might possibly lift them out of obscurity. On the one hand, this meant a new revenue source (and maybe even new readership) for *Publishers Weekly*. But it also signalled an acknowledgement on the part of the industry establishment that self-published books could actually deserve such exposure.

The book world and the cultural tendencies that support it have come a long way from the time when the amateur seemed ominous rather than admirable. The mass culture tradition of social criticism, with its concerns about centralized authority and the standardization of thought, has frequently resonated with those in the book industry and affiliated institutions.² In some strands of this tradition, the triumph of the amateur adds to the cultural crisis of modern society. José Ortega y Gasset (1993), writing in 1930, claimed that the mass no longer recognizes that it takes people with qualifications, and who feel a duty to a higher calling, to participate in intellectual and artistic affairs. The mass now believes instead that anyone can participate in these areas, and that all the ideas, all the opinions, all the efforts are equally valid. For Ortega y Gasset, the result is that mass man becomes smug about his own power; he looks to his own self for answers and thinks it unnecessary to submit to anyone else for judgment (p. 97). But, without standards, Ortega y Gasset says, anything goes; there is no real culture, and barbarism becomes conceivable.

Without adopting Ortega y Gasset's confidence in the superiority of a cultural elite and its standards, one can nevertheless consider critically the social changes that have furthered the sense that professional gatekeepers, who employ their own criteria for selection and in doing so promote an artificial scarcity of creative works, are impeding cultural innovation. In the American book industry, ambivalence about acting as a cultural authority has been present since the middle of the twentieth century; and it was reinforced by a variety of factors, including the influence of corporations interested in vanquishing an image of stuffy elitism, and the entry into the industry of a generation genuinely enthusiastic about popular culture (Miller, 2006, pp. 59–66). The book industry has also been affected by more general cultural forces, which celebrate a democratic access to political power, economic opportunities, and communication media.

However, what we are seeing in the media sector is not the end of an elite, but rather the substitution of the technical expert for the cultural authority. On the one hand, the "information society" is understood to require a technocracy that has the high-level skills not only to produce advances in information technology and in its

applications, but also to assist the rest of the population, which is rendered helpless when machines or systems malfunction. On the other hand, this dependence on a technocracy is accompanied by a reverence for the plucky amateur, who utilizes this technology, sometimes in illicit ways, as a means to practice creativity and mastery. This attitude includes admiration for hackers, who crack the computer codes that professionals created in order to keep unauthorized users out, as well as for self-taught video-makers, who load their creations on YouTube. Henry Jenkins (2008, pp. 2–3) has argued that we are seeing a convergence culture, where content flows across different media platforms, which helps give rise to a participatory culture where media consumers, far from being passive spectators, actively participate in the convergence process (see also Deuze, 2007). Others speak of the “prosumer,” someone who produces new media content through consuming existing material and the tools made available by digital technologies (Collins, 2010). In each of these models, the lines between producer and consumer, and between different forms of media, are blurred.

The field of self-publishing can certainly be seen as an example of this joining together of production and consumption, and of print and digital media. But the growth of self-publishing is about more than just providing a creative outlet for writers. In contrast to how things are in film, television, or even music, the technical requirements for producing a few copies of a manuscript that could be easily read, even if they did not look very elegant, have been within reach of amateurs for decades. In contrast, the self-publishing *industry* is premised on the desire of the amateur to reach a potentially large audience and to profit through one’s writings. In this way it differs from, for instance, the DIY (do-it-yourself) philosophy of punk, which is about the celebration of an amateur aesthetics and of a principled lack of interest in reaching a mass audience (e.g., Green & Taormino, 1997). Whereas DIY turns on its head the usual hierarchy of professional over amateur, the self-publishing industry collapses the professional–amateur distinction, on the promise that one no longer needs the insider knowledge and skills of the professional to be a commercial success. Of course, aside from a tiny fraction of writers, the only ones making any profit in this arena are the commercial services themselves.

The Persisting Professional Publisher

The self-publishing phenomenon raises questions about whether the tasks performed by professional publishers are economically sustainable, or even necessary. Writers and readers bewildered by the length of the time it takes for a manuscript to go through the regular publishing process, and angered by the rising prices of such books, harbor doubts about the value of professional publishers. It is not only the burgeoning self-publishing movement that has caused this loss of esteem for publishers. The spate of scandals involving author deceptions – from James Frey’s not-so-true

life memoir to Kaavya Viswanathan's inclusion in her novel of passages from other authors' works, to Charles Pellegrino's use of erroneous facts in his nonfiction, to Greg Mortenson's misrepresentation of his life and charitable works – have undermined the public's faith that publishers provide a crucial mediating role.³ All of these deceptive authors were heavily promoted by major publishing houses. If such publishers cannot fact-check, recognize plagiarism, or investigate an author's suspicious identity claims, then readers wonder what exactly they are doing.

In actuality, publishers do engage in at least some fact-checking and flag possible problems in an author's work. Publishing houses still work with authors to craft a book so that it meets prevailing literary standards, though these standards may vary depending on what audience an author and her editor have in mind. As one publisher notes:

Wherever ideas originate, they are often simply the starting point on the long road to a finished book, which typically includes extended conversations and conceptual discussions between author and editor about how the material might best be structured, the project's ideal parameters (knowing what to leave out is often an editor's key contribution), how much background is necessary for lay readers to grasp an argument, and so forth. Manuscripts that arrived in "finished" form typically require at least a line edit and a copy edit to maximize the impact of the underlying ideas, to make them coherent and a pleasure to read. (Wachtell, 2010, p. B11)

In other words, professional publishers help authors to communicate. They act as the "support personnel" that belie the image of an individual artist who creates and communicates in isolation (Becker, 1982, 77).

As an alternative to professional publishing, self-publishing is indeed a cheap and widely accessible way for authors to produce books. But it generally comes at the cost of minimal editing and proofreading, the absence of an index and guide to sources, and probably no fact-checking at all. For some readers, this may not matter. But, for others, in a society where so many sources of information and entertainment vie with books for people's time, such qualities may matter more than ever. Moreover, self-publishing does not do away with support personnel altogether. At a minimum, it involves the assistance of skilled distributors.

Indeed, pushing aside professional publishers as gatekeepers does not eliminate the gates themselves. There are millions of potential books available, and readers, by necessity, have to find some way of figuring out which ones to pay attention to. That task is not so straightforward when the gates that determine which manuscripts have a chance of reaching an audience are more inclusive than ever. For instance, readers have been confounded by organizations such as VDM Publishing Group (originally, Verlag Dr. Müller) and its Alphascript, Betascript, and Fastbook imprints. This group has published tens of thousands of books, many of which are simply brief reproductions of Wikipedia material, sold at hefty prices on Amazon and other sites offering self-published books. Internet discussion lists have been filled with stories of dismayed buyers (including at least one university library) who discovered

that the book that had such an impressive title was little more than a snapshot of a web page. As this shows, the ability to simply present a title in an authoritative way can attract buyers. Readers do employ other criteria when selecting books. Word of mouth matters considerably. And there are many industrious volunteers who read everything they can, and then post reviews and recommendations; some of these amateur reviewers gain a real following. But it is still those authors who pay for the assistance of professional marketers and distributors who get the best results. In this way self-publishing does not look that different from vanity publishing.

What has also not changed is that reading is still an activity regularly practiced by a relatively small number of people. As Griswold (2008) notes, a large reading class flourished for only a brief period of time in parts of Europe, North America, and Japan. She argues that, while we are not likely to return to a situation where the majority of a population reads extensively for pleasure, a small elite will continue to do so and will retain a disproportionate cultural influence. Self-publishing does not change this; it is not the case that the existence of more reading options automatically leads to more reading. Rather, time-use studies suggest that reading in general, and especially reading by men, has not increased in recent years (Eurostat, 2004; Sweden Statistics, 2010; US Bureau of Labor Statistics, annual).

In answer to my original question, professional publishers are not going away, despite their fading dominance in the book world. Instead, what we may be seeing is the emergence of a two-tiered system in which the truly popular books and the authors committed to traditional standards go with professionals, and large numbers of amateur publishers see their books produced but not widely read. As an industry journalist noted: "Self-publishing is not considered a particularly attractive option for bestselling authors used to large advances and the marketing, promotion, and distribution provided by publishers" (Deahl, 2010, p. 7). Nor is it so appealing to authors who rely on the editorial assistance and stamp of approval of professionals in order to gain critical recognition. In many ways self-publishing is a positive development, as writers who do not have the savvy or the audience appeal to attract a professional publisher can now maybe reach those readers who are actually interested in what they have to say. But self-publishing also makes a readership largely irrelevant. One can produce a published book whether or not anyone cares about its contents. In this way our understanding of what a book is all about – of its very purpose, and not just of its technological form – becomes something up for grabs.

NOTES

- 1 Thomas Whiteside's *The Blockbuster Complex: Conglomerates, Show Business, and Book Publishing*, which originally appeared in 1980 as a series of articles in *The New Yorker*, castigated the trend toward bigness in the book industry. Whiteside argued that, since the 1960s, corporate consolidations produced ever larger publishing houses that focused on creating mega-selling blockbusters, on giving huge advances to star authors, and on

promoting books through movie and television tie-ins. *The Blockbuster Complex* was widely reviewed, both in the trade and in the popular press.

- 2 The mass culture perspective is related to mass society theory (e.g., Arendt, 1973), which posits a set of social transformations that occurs when people no longer live in traditional communities, but instead become part of an undifferentiated mass with no meaningful common interests and with no obligations or commitment toward any particular group. In mass society people become vulnerable to manipulation by authoritarian leaders and impersonal institutions. The mass culture perspective has been associated with a range of thinkers, including F. R. Leavis (1930), Dwight Macdonald (1960), and members of the Frankfurt School such as Max Horkheimer and Theodor Adorno (1989) or Leo Lowenthal (1961). In this view, culture is increasingly produced and disseminated by rationalized businesses, which are out primarily to make a profit. Despite surface differences, mass culture is seen as essentially standardized and formulaic; it lacks authenticity, depth, or originality; it affirms the existing organization of society and social relations; and it acts like a narcotic that saps the sense of autonomy in the audience, together with any capacity for serious thinking. In the end mass culture absorbs and diffuses resistance in society.
- 3 In 2003 James Frey published *A Million Little Pieces*, which was, supposedly, an account of his often harrowing experiences with addiction. The book, initially published by Doubleday, was a tremendous bestseller and had a notable endorsement by Oprah Winfrey. In 2006 it was exposed as having a considerable number of fabricated incidents. In that same year Kaavya Viswanathan published *How Opal Mehta Got Kissed, Got Wild, and Got a Life*, a novel she had penned while still in high school. Viswanathan had worked with the book packager, Alloy Entertainment, which began as a marketing company, helping advertisers reach youth. The novel received great attention, partly because of Viswanathan's age and status as a Harvard University student. After publication, the book was found to have multiple plagiarized passages from a number of different writers, including Megan McCafferty. Charles Pellegrino published a number of books of history from the 1980s through to the 2000s. After publication, sales of his 2010 book *The Last Train from Hiroshima* were halted by his publisher, Henry Holt, after it was found that the book contained numerous errors and that Pellegrino had relied on a fraudulent source for key claims. In 2006 Viking published Greg Mortenson's *Three Cups of Tea*, a bestselling account of how he was inspired to build numerous schools in Pakistan and Afghanistan. In 2011 the television program *60 Minutes* charged Mortenson with misrepresenting his personal story and accomplishments and raised the possibility of financial irregularities in his charitable work.

“This Is What I Need, This Is What Will Travel”

Television Programs in the Era of Transition

Shawn Shimpach

ABSTRACT

Until recently, broadcast television in the US was premised on profits arising from expanding space (national distribution, national and international syndication) and from limiting time (the imposed scarcity of access). Technological and regulatory changes have meant that television producers have had (reluctantly) to acquiesce in basic changes to this formula. This chapter looks at four ways these changes have affected the production of television programming. Specifically, program producers are compelled to create programs designed to *travel* over borders and through time, to *translate* to different cultures as well as to media, to *tether* to new viewing and new sponsorship practices, and, throughout all these conditions, to continue to *tantalize* viewers, attracting and holding the attention of industry and audience alike, at all these different sites.

Although long referred to in casual industry parlance as “development” or “property,” television programs have recently seen a subtle but significant shift in the way the industry perceives and values them. This new value on individual programs is emerging during a period of rapid institutional and technological change, characterized by the fragmentation and dispersal of what was once imagined to be a mass audience for television. As this audience disperses through space and time and across multiple media, television programs that are produced with specific characteristics designed

The International Encyclopedia of Media Studies, First Edition.

in essence to pursue this dispersing audience are growing in value. This value, moreover, is different from the way television programs have been valued in the past. It used to be the case that a program's value was strictly a function of the eyeballs it attracted to the channel and/or network on which it aired, and for which it therefore dictated advertising rates. Recently, however, the value of programs has begun to shift perceptibly, as they become increasingly understood to be properties in and of themselves, with their own value to be marketed and developed by their owners – as distinct from the particular channels or networks that might show them. This transformation can be traced in large part to an institutional environment characterized by uncertainty, which arises from a series of recent regulatory, institutional, and technological changes that have altered the dynamics of television. Thus, even as ownership and institutional relations are changing, the space and time of the viewing experience of television is changing as well. This chapter is therefore about an approach toward new production considerations and imperatives amidst these tidal changes rather than about the specific individuals behind the production of the programming. These production imperatives are intended to accommodate, even capitalize upon, these changing spatial and temporal relations and the transforming televisual economy.

As products of a robust and professional culture industry, television programs result from particular conditions and specific (if perhaps overdetermined) decisions. Such a statement is not, however, an argument for a simple reflectionism, where the meaning of a program invariably mirrors the conditions (and much less the specific practices) of its production, but it does suggest the theoretical impoverishment of watching or “reading” media texts such as television programs without attempting to account in some ways for their conditions of reception, circulation, and production. The study of production, no less than other analyses of media and media institutions, stands to benefit from an integration of methodological approaches too often kept apart. If one is accounting for both the institutional conditions and the textual characteristics of media production, media such as television programs can be understood (1) for the way in which institutional policy and global economics impact the circulation and meaning of these texts, even as (2) they circulate as culturally significant sites of (multiple, contested) meanings and identification (including dis- and counter-identification). Such an approach to the peculiar biography of a television program involves apprehending the television text precisely at the point where economics and meaning encounter each other, tracking significant moments in the lives (and afterlives) of distinct television programs, and treating the commodity sign of the television program – its spatial and temporal travel as well as its common significations – through a conjunctural practice of analysis, allying socioeconomic with narrative and representational approaches (Miller, 2006, 2008; Murdoch, 1995). From Raymond Williams' early articulation of “flow” right through to John Caldwell's concept of “televisuality,” the televisual form has been demonstrated to be inextricable from the industrial infrastructure of media production and distribution. This chapter focuses mostly on US television as an example in considering the stakes for the study of production when the arbitrary critical divides between

production, distribution, and viewing are instead blended, the program being ultimately the object that all three share in common. The concerns and imperatives of television production – during certain transitional moments such as this – can be particularly revealing of the priorities of institutional relations as well as of the significance of textual markers.

Television Program and Changing Value

Through aggressive policy lobbying and a large and comparatively wealthy domestic market, the US television industry makes for a fascinating and dominant force in global television production and distribution. Moreover, because of its relatively unique arrangements for financing big-budget individual television productions – deficit financing, in which initial license fees fall short of production costs – the mergers of production companies with distribution companies (like networks) have dramatically remapped the interests of intellectual property holders. In the US the financial interest and syndication (Fin-Syn) regulations, which severely restricted the ownership and prohibited the syndication interests that a broadcast network could have in the programming it aired, relaxed in the early 1990s, until the 1996 Telecommunications Act repealed the rules altogether. Repeal meant that television broadcast networks could now also be television producers and intellectual property owners. A series of corporate mergers immediately followed, which saw independent television production companies being bought up by larger media corporations and Hollywood studios being merged with national television networks. Soon ABC American Broadcasting Company and Disney were part of the same company, as were CBS (formerly Columbia Broadcasting System) and Paramount Studios for a time, and then NBC (National Broadcasting Company), Telemundo, Universal Studios, and, later, Comcast, all joining Fox and 20th Century Fox.¹ During the early years of this deregulation, so significant was the integration of production and network distribution that Time-Warner launched the WB, to pair it with Warner Bros. Television, and Paramount helped launch UPN (United Paramount Network) for Paramount Television; thus two new national networks were created. The move was largely undertaken with the intent to avoid having television productions leveraged into shared ownership by other companies, which had merged with already existing national networks² (Shimpach, 2010, pp. 21–2). Now production studios, television networks, and cable channels (even cable system operators) were all together, in vertically integrated corporations that controlled production, distribution, and delivery. Moreover, these corporations were part of larger, horizontally integrated media conglomerates that also included print publishers (magazines, newspapers, comics, books), video game companies, movie studios, and other media companies. The initial showing of a program on television – whether on broadcast network or cable – has been, ever since, only the first part of its usefulness as a piece

of property to be leveraged across corporate divisions, potentially for years to come. As media corporations have merged into vertically (production, distribution, exhibition) and horizontally (multiple media) integrated conglomerates, network, station, and even cable programming feature only as a part of much larger corporate agendas. A new value has been placed on individual programs as properties that can travel and transcend corporate divisions, making their ownership a significant factor in broadcasting and distribution decisions.

This means that television programs are looked at differently now. They are increasingly valued as *properties* in themselves, not simply there to win an audience for a station or a network, but to be sold and resold, as distinct commodity productions. This new significance is not only a function of corporate conglomeration (the prospect of syndication rights has loomed for years, after all), but, in combination with new ownership structures, it is also a result of distribution and consumer technologies that have allowed the traditionally imagined television mass audience to disperse across time, place, and multiple media. For much of the history of television, programming strategies have sought to attract viewers to a particular channel and to encourage them to “flow through” from one show to another, spending extended time tuned to that channel. While individual episodes were temporally limited, requiring viewers to tune in at a certain time for a specific duration or to miss the ephemeral airing, such episodes were part of a continuous and non-stop sequence of programming content, constantly airing without a break. From a programmer’s perspective, this was the best strategy for keeping a national mass audience tuned to a single channel for as long as possible; offering a steady, uninterrupted diet of what former NBC executive Paul Klein famously called “least objectionable programming.” If there was no particularly compelling reason to change the channel, it was thought that viewers would surrender to inertia and simply keep watching the programming on offer, flowing through one program after another, rather than making the effort to change channels (Schiesel, 1998). From the viewer’s perspective, this onslaught of programming content – constantly interrupted by commercials, promos, announcements, and newsbreaks, but never pausing or relenting – could also be experienced, in Raymond Williams’ (1990) canonical term, as “flow”: one long, continuous, objectively incoherent televisual text.

To a large extent, programming practices premised on this model continue, and it is still possible to simply “watch TV,” allowing whatever is being shown to appear on screen when and for how long the station decrees. However, as both space- and time-shifting consumer technologies proliferate, the experience of programming flow has become only one option for the television viewer. Individual television programs are increasingly more likely to be available in more places, effectively *expanding the possible time and space* available for viewing a single episode (or an entire season) of a program. Not so long ago you either saw an episode when it “aired,” or perhaps you happened upon the rerun months later or encountered it in syndication, years after that. Today that same episode might be shown one night, “repurposed” on cable later that same week, made “streamable” on network and other

websites the next day, offered on demand by a cable provider later that week, downloadable from iTunes the next week, purchasable and rentable on digital versatile disc (DVD) later in the year, and then available in syndication after that. At the same time, viewers were offered rapidly proliferating means to access individual programs for themselves, outside of the scheduled programming flow. A series of consumer electronic devices and services have encouraged the practice of "time-shifting" the program-viewing experience. Starting with the video cassette recorder (VCR), which extended to the personal video recorder (PVR) or to the digital video recorder (DVR) and was joined by services like downloadable compressed video sites, streaming video sites, and peer-to-peer file-sharing protocols (like BitTorrent), as well as by cable services such as pay per view and video on demand, consumers and viewers have been able to extract individual programs from the television programming flow and to watch them at a time of their own choosing. Consumer devices such as portable video game players, portable DVD players, and portable media players (like the iPad) as well as applications that allow an individual to encode and stream television broadcasts (such as Slingbox) have complemented consumer time-shifting with the additional ability to space- or place-shift the viewing experience as well.

One result of these changes has been that television programs are increasingly designed and produced to attract viewer attention and investment amidst these multiple and growing options. This process began with producers' and programmers' growing self-consciousness about the look of television, producing what John Caldwell (1995) has termed "televisuality," a "stylistic exhibitionism" in which programs elicit interest through an emphasis on the visual aesthetics of individual television programs. Whether aping the lush, saturated look of cinematic production values or flittering the "videographic" look of live newsfeed, the actual look of television programs began to grow in significance as a production consideration. As programs developed distinct looks and styles in order to attract attention amidst so many viewer alternatives, they began to alter the kind of value they offered to networks. If the ascension of stylistic exhibitionism signaled a new focus on the individual program amidst the growing clutter of television programming's relentless flow and was encouraged by changing viewing practices, then the outcomes of subsequent technological and regulatory transformations have placed even greater pressure on the integrity – while increasing the value – of individual programs as distinct from programming flows. As the growth of competing technologies has developed, production practices have exceeded mere stylistic enhancements and new strategies have developed to adapt the television program to digital technologies across various media platforms. The autonomous television program, viewed on a television channel, is likely to be part of a larger possible experience, which may also include multiple related websites, short tangential episodes for internet and mobile device viewing, associated publications of periodicals, books, and documentaries and DVD "extras," not to mention the growing opportunities for social engagement with the program, from blogs and Twitter feeds to fan fiction and video sites, to discussion rooms and social media sites (e.g., Facebook, MySpace, Google+).

While franchising and merchandising have long been important ancillary practices for media industries (Johnson, 2009), including television, this kind of cross-media expansion differs from what happened in earlier eras. First, it involves more programming, and much sooner. Even before audiences have seen a program, cross-media proliferation begins, as part of the launch strategy of wooing target audiences, of generating anticipation for the program, or of beginning to develop fans of the franchise. Cross-media expansion targets the young, affluent market that is so desired by advertisers and yet is migrating from television to other media forms as their primary entertainment medium. Second, as Brooker (2001), Jenkins (2006), and others have detailed, cross-media expansion frequently involves the elaboration of an increasingly expansive, elaborately interrelated narrative world in which various media pieces might function autonomously, but almost certainly they contribute to a larger understanding of the narrative. Third, more often and more explicitly (if not exactly intentionally) it involves unscripted viewer production and investment in creative, time-intensive, often social engagement with the program franchise.

These trends have been broadly described in a process that Jenkins has termed “transmedia storytelling.” As he explains, “a transmedia story unfolds across multiple media platforms, with each new text making a distinctive and valuable contribution to the whole” (2006, pp. 95–96). Each contribution tends to be self-contained, so that consumers can make sense of it without necessary reference to another contribution, but each should also contribute something unique to the overall transmedia experience. As Jenkins observes, from an institutional vantage, “reading across the media sustains a depth of experience that motivates more consumption.” This, of course, serves the interests of intellectual property holders much more than television channels or stations, and it does so by “offering new levels of insight and experience[, which] refreshes the franchise and sustains consumer loyalty” to a particular program rather than to a channel’s overall flow (p. 96).

Such a strategy not only acknowledges and leverages the dispersion of television audiences across multiple media, but it does so in ways that utilize the horizontal integration of media conglomerates, encouraging audiences to flow now in-between television channels, internet portals, paper publications, and video game franchises, each one often owned or sponsored by the same corporate entity and ostensibly produced in complex coordination with the others. It also heightens the significance of individual programs, even above and beyond the particular network or channel on which they might be first encountered, so that a program can act as the connective tissue binding these various media sites, providing a kind of continuity for the audience experience of different media. Beyond these scrupulously scripted encounters, opportunities abound for less predictable and more social, intersubjective considerations of the program, ranging from snarky plot summaries (e.g., televisionwithoutpity.com) to deeply affectionate fan-produced fiction and websites, to re-edited footage on video-sharing sites, and to the latest individual micro-blog feed.

Producers and networks, however, hardly ignore these institutionally unscripted elaborations of their programs. Showrunners (or their staff) lurk on fan-produced

digital media sites, using them as free, instant focus groups to gauge responses to plot and character developments (Shimpach, 2005, pp. 352–353). Beyond treating the Internet as uncompensated market research, networks have attempted to lure viewers to their programs through various efforts at digital media integration. The Fox network, for example, began airing “tweet-peat” episodes of its programs *Fringe* (2008 to the present) and *Glee* (2009 to the present) in the fall of 2009, allowing viewers who watched certain episodes on television simultaneously to follow a running commentary by cast and crew members through the micro-blogger service Twitter (Kohn, 2009). The ABC network tried a similar strategy with its struggling new program *No Ordinary Family* (2010–2011) in the next year. Other shows, meanwhile, are now designed to encourage YouTube-able moments, promoting themselves through “viral” videos circulated by interested viewers to friends, co-workers, and online contacts. Such moments strive for the global popularity of clips such as that of surprising, erstwhile lay crooner Susan Boyle performing *Les Misérables’* song “I Dreamed a Dream” from a 2009 episode of the television program *Britain’s Got Talent* (2007 to the present). It was several years earlier, after all, that NBC’s senior vice-president for alternative programming (i.e. “reality” shows) noted of *Talent’s* creator and on-screen judge, Simon Cowell: “He cracked that nut in how to do a variety show with a YouTube feel” (quoted in Schneider, 2006). These reproduced and redistributed Internet moments range from humiliating auditions for apparently (but, alas, not singularly) talent-less *American Idol* wannabes (2002 to the present) to memorable skits from *Saturday Night Live* (1975 to the present) and bits from *The Daily Show* (1996 to the present), to David Letterman admitting backstage affairs (Carter & Stelter, 2009), and to *faux* music videos introduced within the diegesis of sitcoms, like *Modern Family* (2009 to the present) and *How I Met Your Mother* (2005 to the present)³ – all almost immediately available for complete and repeated viewing online.

All of this has led to changes – both subtle and significant – in what eventually reaches viewers’ screens, whether these screens remain in the living room, on computers, or in the viewer’s pocket. If, after years of supposedly watching television together, as a mass, audiences are now dispersing to multiple channels and multiple media, new and extra value will accrue to those television programs designed and produced to *pursue* the audience. The value of a television program, therefore, is increasingly a function of its ability to appear to audiences everywhere, all the time. Thus, as NBC Universal’s chief digital officer announced recently, signaling the new strategies of television programming: “We believe in ubiquity distribution” (Littleton, 2007).

This context suggests, above all, two things. First, individual programs now function as – and are, probably increasingly, best understood to be – semi-autonomous properties with their own unique biographies and circulation, for which individual agendas may be developed. As Michael Curtin has summarized:

In this environment, media producers find that the branding of products is often more important than futile attempts to control the mode of distribution. Unlike the network era when the control of a few national channels was the key to profitability, neo-network television firms focus on marketing, promotion, and the control of intellectual property. (Curtin, 2004, p. 281)

As a result, programming has changed, so that individual programs can draw attention from within a crowded environment, sustaining interest over time and across media and traveling across temporal, technological, and national borders. Second, despite being semi-autonomous, these programs are properties of vertically and horizontally integrated media corporations with complex and not always efficient agendas for expanding markets and growing revenue.

In order to fully understand how this era of transition has impacted the production expectations and ultimately the programming generated, it is necessary to approach the television program both in its materiality and in its immaterial value. The television program is a product of the context of production conditions, which are situated within changing institutional imperatives, while at the same time it produces its own cultural value as a ubiquitous property to be mobilized across space and time. The economy of scarcity that gave value to a program sold to advertisers is being replaced by an economy of abundance in which a wide range of industries, their producers and consumers, capitalize upon the program's value as a property.

A Taxonomy of Imperatives

What this means on the ground is that program producers are now compelled to create programs specifically designed as individual properties with extensive lives and afterlives that travel across geographic, technological, and temporal borders. The task of the media scholar becomes one of understanding these developments, as they function together to change both the economic value and the semiotic value of the television program. This task might be achieved by considering the production imperatives that guide and drive television today. We might usefully group these imperatives together into the four Ts of TV. Given this new economy of television production, program producers are now compelled to create programs specifically designed to *travel* over borders and through time, *translate* to different cultures as well as to media, *tether* to new viewing and new sponsorship practices, and, throughout all these conditions, continue to *tantalize* viewers, attracting and holding attention of industry and audience alike at all these different sites.

Travel

We can sit down together and say, "This is what I need, this is what will travel."

Roma Khanna⁴

Programming is now designed to travel, both spatially and temporally, as never before. US-produced television programming has always circulated internationally. However, where once a program would establish itself and gain popularity on a US

network, become profitable in US syndication sales, and then be offered abroad at inexpensive (but by now nonetheless profitable) rates, now international distribution figures as part of the initial program pitch, the program's global circulation being a production consideration from the start.

Thus now even modest programs with short-lived or failed production and network runs find international distribution. For example, the sitcom about a small-town family, which, through a misunderstanding, takes in a Muslim exchange student from Pakistan, *Aliens in America* (2007–2008), aired for only one season in the US, having produced just 18 episodes for the CW Television Network. Yet this program sold in more than 20 other national markets, from Turkey to India, from South Africa to Israel (albeit in non-prime-time timeslots). This travel to screens around the world, moreover, was only the latest leg in this program's global voyage. The US-based production, for example, was filmed in British Columbia, Canada and featured 24-year-old Adhir Kalyan, a South African actor, in the role of Pakistani teenage high school exchange student Raja Musharaff.⁵ Similarly, the science-fiction mystery drama *FlashForward* (2009–2010) sold in more than 100 worldwide markets in 2009, including in Africa via M-Net, in the Middle East via Orbit Showtime, and in markets in Sweden, Russia, and Japan. This was done months before a single episode had shown anywhere (Hopewell & Keslassy, 2009). Signaling the thinking behind this approach to television programming, *FlashForward*'s global distributor, Disney–ABC Worldwide Television's president of global distribution, Ben Pyne, announced that "we believe this type of release helps to spread the buzz around the world" (quoted in Hopewell & Keslassy, 2009, p. 7). This effort to generate a global "buzz" about the program has to do with more than piracy concerns and signals a corporate imperative that exceeds simple market expansion.

It is not news that US television programs are played globally; this has been the case since the earliest days of television, when program copyright holders discovered how lucrative a syndication market exceeding the US borders could be. For years, however, this model of distribution still relied on a successful US network run to produce a market for the program over the three to four years it took to produce the nearly 100 or so episodes needed for an off-network syndication market to "strip" the show across a weekday schedule. With the advent of Fin-Syn in the 1970s, the syndication market became crucial to independent television producers, who were increasingly forced to deficit finance their network productions and could only recoup costs on programs that were successful in the syndication market. International syndication, as a next step, then added to the profit margin of these successful programs, while implicitly helping to pay for those that failed to reach syndication.

What these recent examples demonstrate is that (1) a global market is now regularly being considered as part of a program's initial run; and (2) the purpose of this initial run is, at least in part, to create "buzz" about the particular program. Buzz in this sense suggests an informal familiarity with aspects of the program that might build it into a "brand" that can be sold and leveraged in the future. Branding is corporate jargon for a process of adding commercial, "iconic" value to intellectual

property above and beyond any single iteration of that property (Blumenthal & Goodenough, 2006, p. 160). Brand equity is a corporate phrase used to describe the current and future value of the commercial and cultural aura of a property being “buzzed” about (Moran & Malbon, 2006, p. 108). Thus the simultaneous international distribution of television programming is not only about accessing global markets, though studios do want their programs to reach markets before pirated copies are available. Studios also want to build future value for an individual program globally, through practices of ubiquitous distribution. This practice demonstrates the extent to which it is increasingly believed that the value of a program grows as that program travels.

Programs are produced to travel in order to generate value in the form of brand equity against future uses of the property. Such programs are therefore necessarily also produced to travel through time. Thus the television programming produced to travel geographically must also be durable, sustaining interest and gathering more audience members over time, rather than merely for one or two ephemeral airings. As the indomitable US industry trade journal *Variety* frequently reminds its readers: “What must also be considered though, is playability for a show beyond the immediate ratings. Keeping a series on the air despite questionable numbers, execs look to see how the show plays overseas and what the DVD prospects are – monies that help offset ever-rising production costs” (Levine, 2009). Temporal travel is required to turn transient and ephemeral programs into durable properties. This means that such programming is increasingly produced not only with its life on television in mind, but also with the growing significance on the value of the program’s “afterlife” in mind as well – its continued circulation, repackaging, and repurposing beyond its initial iteration. *Aliens in America*’s mere 18 episodes can still be purchased on iTunes. *FlashForward* was available as video on demand weeks after its television debut in many of the national markets in which it was shown. In the US it was available on the video-streaming consortium site, hulu.com, run by NBC Universal, Fox Entertainment, and ABC. That entire series was soon officially available on iTunes and DVD, unofficially on YouTube. And *Aliens in America* and *FlashForward* were two programs that failed, that were cancelled in their first season!

Indeed, by commercial television industry’s own standards, the vast majority of new prime-time programs fail to garner ratings of the size and kind deemed necessary by their networks to keep them in production past their initial year. Yet these shows continue to live on in some form, being available to be purchased and viewed. They traveled geographically in their short lives, and they continue to travel temporally both in institutionally scripted and in unforeseen ways through their afterlives – quite a scope and span for failures! Imagine the potential for commercially successful programs.

It might be noted that both of these particular examples thematized the new cosmopolitan dynamics of geographic and temporal travel in their own storylines. *Aliens in America* satirized intercultural misunderstanding, parochial ignorance, and the tensions of transnational exchange. *FlashForward* offered globalized mystery and

conspiracy – it was happening simultaneously to all of us, around the world – amid the mass experience of nonlinear temporality. While such strategies clearly do not guarantee long-term success, they nevertheless help to offset production costs and to build a global brand, prompting some kind of sustained afterlife.

Meanwhile, very successful programming trends emerged that would appear to offer counterexamples to the geographic and temporal travel imperatives governing television production today (see, for example, Raphael, 2004). Live sports events as well as reality contest programs seem designed to draw viewers into their "liveness," offering up television's unique ability to bring what is happening elsewhere right now to you, in your home, as it is happening. Such liveness has long been considered central to television's appeal and influence, while it privileges certain forms of access to reality (Feuer, 1983), thus organizing social reality (Couldry, 2004) and negotiating experiences of both immediacy and spatiality in the viewing experience (White, 2004). Such considerations clearly inform not only the cultural impact, but also the institutional strategies involved in programming "reality" television formats. So-called unscripted "reality" programming seems designed specifically to counter changing viewing habits and ubiquity distribution practices by offering explicit incentives to viewers to watch the programming when it is initially shown. This genre has found less success overall when rerun and is less often offered on DVD or as a download. A program like *American Idol* (2002 to the present), a reality competition focusing on the national audition process for a young new pop singer, for example, has drawn large enough prime-time audiences to be the top rated program in the US for several years. The draw of the program is in part derived from an "interactive" component in which the contestants are eliminated from the show by viewers who either telephone or use the short message service (SMS) to send in their "votes" as text message. The final results and the new season's winners, moreover, are announced during a "live" television event. None of these textual strategies can be effectively sustained into time-shifted viewing, which thus elevates the "live" ratings of each episode. Not only does time-shifting negate "liveness" and eliminate the possibility of text-message participation, but the internet is filled with commentary about the program within minutes of the winner's announcement. The results are discussed at work and at school the very next day. While such appointment television stands somewhat apart from traditional programming flow, nonetheless it provides multiple incentives to watch the show when and as it is first offered, "live."

Yet such programming *does* travel, both geographically and temporally. *American Idol*, despite its title, actually traveled to the US. A franchise of the British talent contest originally called *Pop Idol* (later reconceived as *The X-Factor*), the program is co-owned by 19 Entertainment (founded by Simon Fuller, formerly of Spice Girls fame) and FreemantleMedia. It has travelled globally as one of the most successfully franchised program formats in the world (Adalian, 2002). The over 40 officially licensed versions include *Australian Idol*, *Idols West Africa*, *India Idol*, *Indonesian Idol*, *Nouvelle Star* (France), *Pinoy Idol* (in the Philippines), *Superstar* (shown across the Arab States), as well as versions from Sweden to South Africa, from Singapore to Greece,

and from Malaysia to Bulgaria. Meanwhile unlicensed versions of the program are shown in locations from China (*Super Voice Girls*) to Afghanistan (*Afghan Star*). Temporal travel consists of clips packages later available on television, continuously on the Internet, and eventually on DVD. These tend to feature “favorite” performances and memorable “moments,” “best and worst of” montages, and season-finale performances and highlight recaps. The continuing careers of winning contestants (and even of popular non-winning contestants, all of whom sign extensive contracts with an affiliated entertainment company) extend the afterlife of the program. Thus even the programming most aggressively encouraging viewers to enter into television’s traditional viewing practices in the end subscribes to the new imperative to travel through space and time.

Translate

There is no point in trying to sell a program that is parochial or culturally exclusive to one territory.

Donna Wiffen⁶

Intimately bound to travel, television program production’s second imperative is to translate – that is, not only to travel globally, but also constantly to find local amenability. Such translation is not limited to new national and cultural settings; it extends to new media platforms as well. The production of television programming must now consider and actively include possibilities for translation across languages, localities, and cultures as well as translation across screen size, distribution platforms, and indeed media. As the trade journal *Variety* reminded its entertainment industry readership, so far as international co-producers and distributors are concerned, “before the accountants and lawyers get down to work, the script must be able to transcend national boundaries” (Clarke, 2009). In other words it is one thing to distribute a program around the world, in an effort to expand the program’s market and to create international “buzz” for the program’s brand potential, but it is another thing to imagine (and then attempt to capitalize upon) the ways in which that program might find local resonance and amenability in a wide variety of local sites of television viewing around the world. Similarly, while it is a relatively straightforward (if, until recently, novel) practice to distribute a program over the Internet, onto portable media devices and mobile phones, in DVD collections, and through other outlets, it is perhaps less clear how that program’s transmedia coordination and expanding narrative will actually play on so many different devices, screen sizes, and over extended periods of time. Thus, while translation is intimately bound to travel, it nonetheless offers the opportunity to focus upon those textual features of a production that are intended to facilitate not only travel, but also specific, various, and often unpredictable moments of accommodation across cultures and media.

Programming translates, for example, as the licensing of program formats for reality programming. Program formats are sold around the world by intellectual property rights holders, while local broadcasters tailor details of a program to local practices and tastes (Esser, 2010; McMillin, 2007; Moran & Malbon, 2006; Straubhaar, 2007). Such financial and production partnerships assure that reality programs are produced "with an in-depth knowledge of the local market" (Remy Blumenfield, ITV director of global formats, quoted in Clarke, 2009). Thus the Indian version of *I'm a Celebrity . . . Get Me Out of Here!* (*Iss Jungle Se Mujhe Bachao*) saw licensing and production arrangements negotiated three ways between ITV Studios, Sony TV India, and the local Indian production company MidiTech (Clarke, 2009). The British program *Weakest Link*, meanwhile, could air in more than 40 countries, but it could feature local references and be hosted by local or regional celebrities in each iteration. For the third season of *Gran Hermano* – the Argentine version of the initially Dutch and now internationally recognizable *Big Brother* – the increasingly familiar program was kept fresh by offering a contestant exchange with Spain's version of the same program (Johnson & Newbery, 2002). Program formats that failed in one national market (e.g., *Power of 10*, hosted by Drew Carey on CBS in the US, 2007–2008) could prove popular and successful in another (e.g., *Dus Ka Dum*, hosted by Salman Khan on Sony TV in India, 2008–2010: see Hasan, 2008). Such renewable success in so many different locations, with seemingly so many different versions of a show's idea, is the result of detailed and extensive production practices designed to translate a program's success around the world while growing its value as a property with a commodity brand.

Recall the example of the global success of *Pop Idol*. This program's textual characteristics allow every version of the show, in so many different cultural and national locations around the world, to appear on television as locally produced. Each iteration of the program is carefully translated for its local market, with regional celebrity hosts and local musicians/celebrity on-screen judges. Each version of the program has local contestants compete by singing music familiar to and popular with local audiences. Finally, crucial to this program's success has been the participation of the local audience: viewers telephone or text-message their preference for a winner, and the tabulation of those votes results directly in determining the winner (Lisotta, 2006). To facilitate adaptations, the production distributor Freemantle does not conclude its involvement at the signing of the license agreement. Instead the company "has an arm of 'fliers,' executive producers and other experts who travel the world" (Brown, 2003, p. 6) – to guide, inform, and train national and regional production partners in the "secrets" of the program's success. Fremantle's president of worldwide entertainment at the time, Alan Boyd, argued:

We send our executives, tell them the tricks, for example, how to choose judges. There are only a few places, such as Iceland or Kazakhstan, where they are allowed to make it themselves. In all-important markets we're there. It's like going into hospital. You don't want a doctor to operate on you who's never done it before. It is not a simple job. If a show is made badly, it devalues the format. We basically give a warranty to the channel. They are buying past experience. (Quoted in Brown, 2003, p. 6)

Beyond the question of Iceland's importance (or medical care), these life-or-death metaphors suggest the extent to which such advice and supervision demonstrate the intellectual property holder's commitment not only to successfully implemented versions of the program, but also to its maintenance of the property's global value, even through multiple translations.

Scripted narrative programming can also "translate" through similar format licensing agreements, though it tends to do so less often. Even as the US suburban melodrama *Desperate Housewives* (2004–2012) was shown with Spanish subtitles on Sony Entertainment Television in Argentina, Canal 13 there debuted *Amas de casa desesperadas* (2006–2007), an officially licensed, Spanish-language adaptation of the Disney-owned property (Kunz, 2010, p. 309). US television schedules meanwhile have seen *faux* documentary sitcoms like *The Office*, licensed by NBC from Great Britain, serial dramedies like *Ugly Betty* (2006–2010), licensed by ABC from Columbia, and psychological dramas like *In Treatment* (2008 to the present), licensed by HBO (Home Box Office) from Israel. Each has its premise and format translated into successful US productions. That is, while the premise and format of the program is licensed from elsewhere, the cast, references, language, and in many cases the very tone of the program can be localized for a new television market. As an NBC executive suggested about changes made to *The Office* for US audiences, "I think Americans need a little more hope than the British" (Kunz, 2010, p. 321).

Narrative programming, the value of which is derived from specific stories and characters (and often actors), has, however, more often been sold as produced. Such programs frequently rely upon spectacular visuals and special effects, visceral action sequences, and graphic violence and sexuality to assure interest and basic translation across national, cultural, and linguistic barriers. Certain textual and narrative elements have long been thought by television producers to be more "accessible" to viewers across linguistic and cultural difference. Program qualities thought to offer "a high degree of cross-cultural translatability" include rapidly paced narratives that rely more on action than on dialogue, visceral spectacle and visuals, as well as "ostentatious consumption, provocative sexuality, breathtaking stunts, stylized violence and (increasingly) sensational special effects" (Osgerby & Gough-Yates, 2001, p. 28). These textual markers have been characterized by program producers and by television scholars alike as qualities that can be "easily recognized, understood and assimilated in a diversity of contexts and markets" (p. 28). Some programming, in other words, is produced ready to translate. Thus recent years have seen the growth of internationally successful, visually stunning forensic crime dramas like the *CSI* franchise (*CSI: Crime Scene Investigation*, 2000 to the present; *CSI: Miami*, 2002 to the present; *CSI: New York*, 2005 to the present), as well as action-hero dramas, from *Smallville* (2001–2011) to *24* (2001–2010), *Chuck* (2007–2012), and *Human Target* (2010–2011). Programs such as these tend to travel globally as they are produced (rather than in locally produced format licensing form), relying on their compelling visuals of special effect, action, violence, and high-end production values to aid in translations.

The need to translate across multiple media platforms internationally also impacts the programs' look and stories. Television programming, in its expected travels, is increasingly designed to translate to differently sized screens, from giant plasma screens in the living room to small cell-phone screens on the go. These different distribution and exhibition platforms imply new viewing situations, from that of the casually glancing couch potatoes to that of the actively engaged web surfers, from that of detail-focused, invested fans to that of distracted multitaskers. A single program must “translate” so that casual viewers are not impeded from simply watching television as they presumably always have, even while the avid viewer is meant to perceive this cross-platform convergence as significantly heightening the possibilities of narrative engagement with the program. In fact, this appeal is meant to be amplified through interactive web designs encouraging the investment of both time and emotion in exploring minutiae related to the production or the diegesis (or both) of a specific program. As television program narratives have been produced to follow their audiences through space and time across multiple platforms, convergence has favored production strategies aimed at digitally literate viewers with access to high-speed Internet – that is, particularly at younger audiences with (access to) both financial and cultural capital. Thus, while the aesthetics of such programming strives for visual attention amidst the clutter of other programming, the form and the narrative might be designed to reward motivated pursuit across multiple websites and intersubjective viewing practices fostered by social networks, blogs, and discussions concurrent with Internet exploration, and to bolster efforts at getting fragmenting audiences to converge upon their branded intellectual property.

Television's expansion into “new media” realms has gradually resulted in texts intentionally designed to be experienced in multiple ways. Narrative material showing snippets of back story, the exploits of minor characters, video diaries of recurring characters, and other narrative enhancements effectively translate what was once a single narrative, on the one hand, to each medium and, on the other hand, to this new environment of dispersed audiences, and they do so through a strategy of semi-autonomous textual dispersal. Yet the work of translation across media is done at the expense of the industry's labor force, as networks and studios insist to guilds that the creative work of digital media does not fall under the “television” work for which they have been contracted and for which payments are made. Even as an enormous amount of labor is necessary for vast expansion into multiple media realms, the creators of ideas, narratives, and characters are frequently left out of the expansion, elaboration, and residual recompense of their very creations (Banks, 2010).

Programs, from *Smallville* to *Lost* to *FlashForward*, have made exhaustive diegetic use of the Internet as part of their characters' activities within the program. *Smallville*'s main character Chloe accesses in each episode multiple encrypted websites, many of which are available online for fans to investigate themselves. Similarly, *Lost* supplied viewers with an actual website for booking tickets on the fictional Oceanic Airlines while they scout for clues about the narrative and learn about the program. More overtly, *FlashForward*'s FBI agents quickly assembled the online “Mosaic,”

which is designed to aid in their investigation and to offer episodes of a fictional public television documentary series, *Stories from the Mosaic*. Promotional efforts on behalf of *FlashForward*, meanwhile, extended the text to the Internet site, which encouraged viewers to pretend that the premise of the show was real and to contribute their own visions of the future. These efforts also included early experiments in “augmented reality,” with magazine ads (which in this case were to be scanned by a computer’s webcam, which led to a “10-minute experience” of promotional video: see Schneider, 2009). Much of this translation was created and enacted outside the usual labor pool.

Tether

This combination of travel and translation puts considerable strain on the integrity of the television text, pulling it in multiple directions, asking of it multiple results, demanding the television text to tie together a wide variety of not necessarily compatible imperatives. Thus television production must now consider a text’s ability to tether these demands together into a coherent text, even as that text is often further asked to tether fragmenting, diverse, and dispersed viewers together, into a collective “audience,” *and* to tether programming elements together with advertising elements. Tethering allows us to understand the suturing role of the individual television program within the broad economy of commercial television programming, in which individual programs bear the work of uniting dispersed audiences with commercial content.

Television tethering now involves two simultaneous tasks. A program that travels and translates, in search of television’s dispersed audience, is valued for characteristics that allow it to bring together multiple audience constituencies into one larger audience for the program. In addition to traveling to audiences and translating for the benefit of various local encounters with the program, the program often seeks to attract multiple and distinct constituencies. Second, as programs disperse and translate in order to amass audiences beyond television’s traditional flow, they must tie textual features with commercial sponsors through a variety of techniques, from cooperative productions to “product integration” and corporate tie-ins. In short, producers value a single program for the way it tethers textual appeals to dispersing audiences that can be tethered back together into *an* audience to be sold to commercial sponsors.

With increased competition for advertising dollars and with the ability for viewers to “zip,” “zap,” and otherwise avoid commercial breaks, programs that can tether the sponsor’s message to the program’s text are highly valued. Television programming increasingly incorporates advertising products within its text, the paid placement of consumer commodities occupying screen and narrative space. Programs also incorporate incentives for viewers to seek out media spaces more fully controlled by individual sponsors. The program *Heroes* (2006–2010), for example, worked closely

with auto maker Nissan in designing a narrative environment for multiple and sustained product integration. Product placement subsidized the show's budget and marketed the show through ongoing experiments with customized content touting both program and sponsor. As NBC Universal's president of sales and marketing put it, the network's effort was to "enhance the effectiveness of using our content for advertisers to deliver their messages" (Steinberg, 2007). Nissan sought a "TV property the automaker could own with audiences through multiple media channels" (Halliday, 2007). Before its pilot had debuted, "Nissan's product placement planner [. . .] worked closely with the show's producers to place vehicles in 10 episodes" of the first season (Graser, 2007). Nissan was effectively tethered to both the program's text and the program's online *Heroes* comic book, which, in turn, linked to Nissan's own website (Halliday, 2007).

The same consumer technologies that facilitate these complex schemes to tether product to program capitalize upon audiences dispersing across multiple channels and multiple media. Therefore a second tethering imperative for program production is to tie these audience fragments together to the show, in effect reimagining the mass audience that has driven commercial television sales since the 1950s. It is not uncommon for individual programs to mix multiple, simultaneous genres in a program. *Supernatural* (2005 to the present), for example, is a family melodrama, a buddy action show, and a fantasy horror program, all in any given episode and each intended to appeal to different audience groups, simultaneously. *Lost* (2004–2010) was an ensemble psychological drama, a tropical adventure story, and an eerie science-fiction program. *Desperate Housewives* was a domestic melodrama, an ironic comedy, and a suburban mystery show. *FlashForward* offered science-fiction, domestic drama, police procedural, and mystery, all within most episodes. Action shows are also domestic dramas, with an occasional comedy or fantasy episode to be expected. Each of the genres in these and many other programs are thought to appeal to different segments of the fractured, dispersed audience.

Similarly, in an effort to attract the casual viewer while sustaining the interest of more committed audience members, programming form now regularly tethers episodic with serial attributes. While individual episodes tell complete stories and end conclusively within a single airing, the serial structures allow for certain narrative elements – such as central enigmas, villainous plots, budding romance, or character development – to continue over multiple episodes, and even over multiple television seasons. Hence the crime of the week might be solved by the hero of a police procedural, and the bad guy might be captured. In the same episode, however, the romance between the heroine and her attractive lieutenant remains tantalizingly ambiguous, and one more piece of a recurring character's mysterious past has been revealed, all to entice more invested viewers. Programming tethers multigenre, multiform, product-placed textual attributes together in one program. Awareness of the imperatives of tethering allows us to look at production techniques designed to recombine a program, an audience, and advertising in new ways beyond programming flow, as the audience disperses and the program travels and translates.

Tantalize

Verb: to torment with, or as if with, the sight of something desired but out of reach; tease by arousing expectations that are repeatedly disappointed.

Dictionary.com

To travel, translate, and tether in this fashion, a program must continue to tantalize, attracting and holding the attention of industry and audience alike, in all these different locations of travel and translation and amidst all these multiple tethering strategies. Commercial television has always been produced to attract the right kind of audience (that is, those whom advertisers would like to reach), and it has often done this by providing aspirational characters and settings. However, as television programs travel and translate in an environment with ever more competition for audience time and attention, they are now produced specifically to ask for *more* and *different* kinds of attention, rather than simply fitting into the programming flow, unobjectionably. As Michael Curtin has argued – and industry wisdom appears to agree – “given a greater range of choices, audiences are drawn to the products by textual elements – characters, story lines, special effects – rather than by the technological and regulatory constraints formerly imposed on the delivery system” (Curtin, 2004, p. 281). The relentless sequencing of Raymond Williams’ “planned flow” (1990, p. 86) is increasingly understood as being less persuasive than the qualities of individual texts in attracting audiences within twenty-first-century media clutter.

Certainly some such qualities emerge from the growing ubiquity of the aesthetically arresting “stylistic exhibitionism” of Caldwells’ (1995) “televisuality.” Disparate textual elements with aggressively visceral aesthetics and graphic effects are central to generating interest in programs. From *CSI*’s graphically animated and rapid zooms (now clichéd) into gaping bodily wounds to *The Office*’s increasingly familiar *faux* documentary shooting style or to the explosive barrage of sound and graphic effects that introduce and interrupt prime-time sports, all are designed to tantalize viewers.

Program narratives organized around singularly intriguing and/or suspenseful concepts are also meant to tantalize by intriguing viewers with hints of future developments. Online speculation, exegesis, and intersubjective and social viewing practices meanwhile expand the brand. Dramas, from *Lost* to *24* to *FlashForward* to *The Event* (2010–2011), offered central enigmas and high-concept premises combined with serial narratives, all designed to sustain viewer interest. Indeed, even while translation strategies devalue creative labor in television production, tantalizing strategies presuppose increased efforts for showrunners, writers, and other workers who keep track of complex narratives within stylistically heightened visual presentations.

Tantalizing viewers across geographic and temporal travel and translation and amidst multiple tethering practices also extends, in production practices, to populating programs with characters that elicit strong emotional responses (affection,

attraction, hatred, etc.), and with characters presumed to look like the primary audience demographics being sought. Thus melodrama, with its exaggeration of Manichean contrasts between good and evil characters, remains a popular genre in much television programming (including unscripted reality shows), even while the growing trend of populating program casts with multi-aged, multi-ethnic, even multinational ensembles is intended to signal *entrée* for viewers of corresponding demographic groups. Further experiments in tantalizing audiences through interactive options – to vote characters off the program, to exchange Internet messages with fictional (or reality) characters, or even to customize character identities for future episodes – suggest the extent to which subjective identification with television characters factors into efforts to tantalize into viewing specific television programming.

Conclusion

What these four Ts of TV mean for the study of media production is that, as the “property” of programming is distributed into ubiquity, the same activities and options that motivate television convergence practices, the circumvention of temporal scarcity, and the fragmentation of the audience are also the cause and the result of the remarkable growth in the transformation of production practices. Amidst this period of transition from scarcity to abundance of viewer access to individual programs, the function, and indeed the very definition of television programming, has been transformed. Conceived of within the industry as intellectual property with brand potential, programming is no longer simply the content of broadcasting, but instead has become best understood as being itself a valuable commodity in textual form, disseminated across a multiplicity of viewing and institutional practices. Any given television channel has become just one means of encountering (a part of) the program on offer. Any given program is increasingly conceived of and produced so as to be experienced in multiple places and over an extended period of time. Servicing a television network’s broadcast schedule and ad sales is now imagined as only the first step in a program’s sustained and expanding life as a valuable property. Ultimately, the expanding spatial reach of a temporally limited program is being replaced, as an institutional strategy, by another, which emphasizes the spatial and temporal ubiquity of access to that program. Mitigating against the increasing uncertainty of a fragmenting audience is only one component in this new attention to television programs.

This is a broad transformation in television production, which could not be adequately accounted for and described without considering both political-economic influences on institutional practices and the textual analysis of programming in circulation. Television now requires specific, integrated strategies for viewing and analysis if we are to understand and adequately engage with all that we see. The four Ts

offer a way of imagining the work necessary for us to know, together, the labor and the leisure, the making and the meaning, of the television programs with which we have been invited to spend our time.

NOTES

- 1 Fox had largely eluded Fin-Syn enforcement in its first decade as a network through special considerations in the name of competition and by not broadcasting a full prime-time schedule.
- 2 In the event, a series of mergers and divestments involving CBS, AOL, and station group owners, combined with continuing demand for Warner Bros. and Paramount, produced programming on other networks; the changing fortunes of broadcast television in general and the difficulty of launching even one, much less two new networks combined so that The WB Television Network and UPN (United Paramount Network) merged into The CW Television Network in 2006.
- 3 See, for example, <http://www.youtube.com/watch?v=66TqUyjqM40> and <http://www.youtube.com/watch?v=GF1b1pf9DRY> (not available in some countries).
- 4 Head of NBCUniversal Media's international networks and digital businesses, quoted in Pfanner (2007).
- 5 Taking full advantage of the end of Fin-Syn, the program was produced by the CBS Corporation's production division, CBS Paramount Network Television (subsequently to become, in 2009, simply CBS Television Studios). It aired on the CW Network, which is half-owned by the CBS Corporation.
- 6 Vice-president of production and networks for worldwide drama at international media distributor FremantleMedia (quoted in Clarke, 2009).

A Critical Analysis of Cultural Imperialism

From the Asian Frontlines

Dal Yong Jin

ABSTRACT

Asian cultural industries have produced and exported domestic television programs and films on a large scale since the mid-1990s, challenging scholars' theories of cultural imperialism. The process remains complex, however, because the US still dominates the Asian cultural market and has expanded its influence through massive capital investments. This chapter analyzes the nature of transnationalization for Asian cultural industries in order to establish whether cultural imperialism is phased out in Asia. It explores the flows of Asian cultural products and examines the import and export of these goods in recent years. It then challenges the assertions made by scholars who formulate a reverse cultural imperialism thesis, and it questions whether cultural imperialism is still useful in explaining the Asian cultural market.

Over the last decade the production of Asian popular culture has increased: its creations have entered Western as well as Asian markets. From Korean dramas to Chinese films and from Bollywood movies to Japanese animation and console games, Asian cultural products have become globally popular. Despite the increasing scholarship that examines the role of Asian cultural products or of their industries, there is no consensus on Asia's role in the global cultural markets. In particular, the rapid growth of Asian cultural products has raised the question whether cultural imperialism is a

reliable characterization of contemporary Asian cultural markets. In fact some media scholars have already sounded the death knell for cultural imperialism as a useful concept in media production studies.

Asian countries have different languages, economies, and political situations; therefore it is not an easy task to consider them as a whole, in an attempt to evidence cultural imperialism or its alternatives. It is also difficult to confirm that Asian popular culture has irrefutably earned dominance in the global market, due to the limited period of its transnational circulation. In other words, it is premature to conclude that the current boom of Asian popular culture is a transitory phenomenon or that it will last longer. Beyond this, however, the present chapter argues that US influence has never decreased; instead it has rapidly increased, through a new transnational guise and amidst market liberalization in several Asian countries.

The chapter discusses the recent development of Asian cultural industries, in particular film and broadcast industries, to demonstrate the increasing role of Asian popular culture in the global market. It is not meant to examine the causes behind the increase in Asian cultural exports. It investigates instead whether the recent growth of regional cultural industries justifies a shift away from the norm of the cultural imperialism thesis. Historically, three major critiques were adduced to this thesis. Although the three are not mutually exclusive, each critique applies to case studies based in Asia. The chapter rehearses them in order to show the relationship between cultural imperialism, its critique, and emerging Asian cultural markets. This analysis helps to establish that cultural imperialism is still a useful heuristic for explaining both the emerging Asian cultural market and the changing nature of Asian cultural industries.

Early Theses on Cultural Imperialism

Since the late 1960s media researchers all over the world have discussed the unequal flows of television programs and motion pictures from Western to developing countries in terms of cultural imperialism. Imperialism involves an extension of power or authority over others, with a view to domination, and it results in the political, military, or economic dominance of one country over another (Wasko, 2008). Cultural imperialism extends this definition to incorporate the cultural imbalances and inequalities between rich and poor nations that result from economic and technological gaps between them (UNESCO, 1980). An early theorist of cultural imperialism, Herbert Schiller, argued that the economic dominance of the US and a few European nations over the global flow of media products had cultural impacts:

The concept of cultural imperialism describes the sum of processes by which a society is brought into the modern world system and how its dominating stratum is attracted, pressures, forced, and sometimes bribed into shaping social institutions to correspond to, or even promote, the values and structures of the dominant centre of the system. (Schiller, 1976, pp. 9–10)

Schiller's thesis focused on the conjunction of US entertainment, communication, and information (ECI) industries, and it was further developed by a range of communication scholars worldwide, who found empirical evidence of imbalanced cultural flows in the specific areas of news, television, film, and other forms of entertainment (Beltran, 1978; Dorfman & Mattelart, 1991; Guback, 1984; Nordenstreng & Varis, 1974; Tunstall, 1977; Varis, 1974). For example, through a survey of the buying and selling of TV programs in 50 countries, Tapio Varis (1974) concluded that the flow of information, television dramas, and news items is one-sided between Western and non-Western countries. Nordenstreng and Varis (1974, p. 52) also pointed out that, "globally speaking, television traffic does flow between nations according to the one way street principle: the streams of heavy traffic flow one way only." Armed with data demonstrating the one-way flow of cultural goods from Western to non-Western countries and from Northern to Southern countries, scholars of cultural imperialism in the 1970s and 1980s implied that non-Western and Southern countries were victims of parallel imperialisms, which helped the Western and the Northern countries maintain commercial, political, and military superiority. Grounded in the nation-state, US media corporations were the most notorious in these studies, not only for the power they exerted over cultural economies elsewhere, but also for the threat they posed to indigenous and local cultures internationally. Despite these grand statements, Asian countries were nearly absent from research agendas until the mid-1990s, when the consumer market for popular culture emerged as a national, and then as a global force.

Challenges to Theses of Cultural Imperialism

Since the early 1990s cultural imperialism theses have come under increasing scrutiny, in light of the growth of cultural industries in those Eastern and Southern countries supposedly dominated, respectively, by the West and the North. In particular, several Asian countries have rapidly developed their own cultural industries, which have infiltrated markets in other parts of the world. The growth of film industries in Asia – for example, the "Korean Wave," which symbolized the wave of Korean dramas and films across Asian markets, and "Bollywood," the Hindi-language film industry based in India – have challenged theses on cultural imperialism under three rubrics: (1) the development of local cultural industries; (2) peripheral vision; and (3) active audiences. Together, these rubrics have contributed to the formation of what might be called globalization theory.

The Development of Local Cultural Industries

Tracy (1988) states that Third World media producers strengthened their national cultural industries to compete with once dominant US and European cultural industries.

Table 10.1 Sales in the Korean television market

	1995–1996	2000–2001	Change
Imports	69.3	20.4	29.4%
Exports	5.5	28.8	524%

Source: Ministry of Culture and Tourism of Korea, 2002; Ministry of Culture and Tourism, 2003.

As a result, cultural imperialism no longer exists. Proponents of this critique (see also Straubhaar, 1991 and Reeves, 1993) point to the rise of media conglomerates, such as Televisa in Mexico and Globo in Brazil, which not only defend their own national cultures, but also export these cultural messages to neighboring countries. In the Asian context, the Korean Wave provides a ready example of the ways local cultural production may counter cultural imperialism. Although Korea seemed completely captured by foreign film and television companies by the late 1980s, investment from both the government and private sectors in cultural industries in the late 1990s seemed to reverse one-way flows between Korea and the West.

In the television market alone, Korea's imports dropped by a factor of three and increased fivefold as Korean-made television programs appeared in China, Taiwan, Vietnam, and Japan (see Table 10.1). Although these figures would reverse once again by 2007 – a fact to be discussed in more detail later – they indicate that the growth of local cultural industries may reduce the possibility of cultural imperialism.

Peripheral Markets

A second critique of cultural imperialism emphasizes how countries located on the peripheries of world capitalism, namely those that used to be the dumping grounds for US and European cultural products, have become economically interdependent in recent years. Drawing implicitly on Wallerstein's (1974) distinctions between core industrialized and peripheral markets, these scholars (see Chan, 1996; Pendakur, 2003; Shome & Hedge, 2002; Sinclair, Jacka, & Cunningham, 1996) provide ample evidence of Western markets that import cultural products from peripheral countries. Chinese films and co-productions, such as *Crouching Tiger, Hidden Dragon*, have become major box-office successes in mainstream US movie theaters. Bollywood films screen in movie theaters across major US cities with large Indian American populations. There are even theatres that exclusively show Bollywood films in Vancouver, Canada. While Wallerstein considered China and India "semi-peripheral" countries due to their rapid industrialization, their cultural presence in Western markets at the very least destabilizes strict notions of cultural imperialism as a one-way flow of goods from the West to the East. It is also interesting to note that many

countries that neighbor China or India, for example Bangladesh, Sri Lanka, Vietnam, and Cambodia, fear the encroaching imperialism of these “semi-peripheral” countries due to the shortage of resources, skills, and technologies in their own domestic cultural markets. Although core–periphery is a relational concept, periphery-vision proponents have adapted the existing core–periphery model to a more complex and global cultural economy.

Active Audiences

Another main line of attack on the cultural imperialism thesis focuses on the third weak link: its underestimation of local resistance to Western dominance (Curran & Park, 2000, p. 6); it cites how local audiences modify, hybridize, indigenize or transform the meaning of foreign media products through their own local frameworks for understanding. These critics of cultural imperialism emphasize consumers’ active appropriation and selectiveness in their choices of media contents, showing that audiences often prefer culturally proximate contents over imported programs (Straubhaar, 1991). Supporters of active audiences have also analyzed the diverse responses of audiences outside of the US to Western media, thus debunking the supposed cultural effects of cultural imperialism. Liebes and Katz (1990) conducted seminal studies of the comparative reception of the US television program *Dallas* in the 1980s. They found that viewers’ interpretations of the program varied according to their nationality, religion, generation, and values. These studies tempered earlier work, which considered the program a prime example of American cultural imperialism (White, 2001). In other words, they point out that cultural imperialism theses have not adequately acknowledged audience members’ abilities to process information and to interpret messages in different ways, on the basis of their individual backgrounds. Primarily due to these cases, Mirrlees (2008, p. 177) bluntly claims that cultural imperialism theses failed to address the complexity of local audience reception practices.

Critiques of Cultural Imperialism and Globalization Theory

By the late 1990s studies of globalization took the place of studies of cultural imperialism as the key issue in the study of media production outside of the US and Europe. Combining the three rubrics for critiquing cultural imperialism theses, theorists of globalization (Appadurai, 1996; Robertson, 1992; Tomlinson, 1991) have focused primarily on cultural issues instead of the political economy of media production. They dismissed the notion of cultural imperialism for its vague language of

domination, colonialism, coercion, and imposition. Arguing that cultures and societies could no longer be analyzed in the framework of the nation-state, globalization theorists emphasized cultural pluralism and diversity over national politics or economic domination.

Media scholars have taken up globalization theory in relation to Asia most prominently through case studies of Japanese popular culture. Referencing media franchises such as Pokémon and Sailor Moon, as well as animation and manga genres, Iwabuchi (2008), Consalvo (2006), and Thussu (2007) implicitly claim that cultural imperialism is dead in Japan. Indeed, Japanese cultural exports have increased rapidly in the time period since Schiller's articulation of cultural imperialism. Japanese film production increased from 289 films in 1995 to 418 films in 2008, making Japan the third largest production market, behind the US and India (Ministry of Internal Affairs and Communications in Japan, 2010, p. 746). No longer confined to Samurai movies, Japan has produced several films that were successful as Hollywood remakes, such as *The Ring* (2002) and *Shall We Dance* (2004), *The Grudge* (2003), and *Dark Water* (2005). The success of Japanese console video games throughout the world has been even more striking. The worldwide game market is expected to increase from \$27.1 billion in 2005 to \$46 billion in 2010 (PricewaterhouseCoopers, 2006, p. 368). Japan dominates this market through its dedicated consoles, which are produced primarily by two Japanese-based electronics companies: Sony and Nintendo.

Japanese media contents have found receptive homes in Asian countries. Regionally, Fung (2007a) writes that culturally proximate countries such as Singapore, Hong Kong, and Taiwan see Japanese contents as easy to adopt and symbolically more Western than those from North America and Europe. This is because, although Japan has made its own unique cultural products, Japanese popular culture adopts the production skills, formats, and styles of Western culture, a phenomenon that makes Japanese media part of Western culture (Jin, 2009). Meanwhile, Japan deliberately markets its television dramas, comics, and cartoons within Asia by erasing its "cultural odor," or the association of a country of origin with a cultural product (Iwabuchi, 2002, p. 95). This was necessary in order to erase the historical legacy of the Japanese as imperial oppressors in the region (Lee, 2004). Through this strategy, Iwabuchi (2008, pp. 145–146) asserts that Japan has escaped from American cultural dominance.

The dominance of Japan in global popular culture markets has led the cultural studies scholar Stuart Hall to conclude that Japan is actually closer to the West than to the East:

These days, technologically speaking, Japan is Western, though on our mental map it is about as far East as you can get. By comparison, much of Latin America, which is in the Western hemisphere, belongs economically to the Third World, which is struggling – not very successfully – to catch up with the West. (Hall, 1996, p. 185)

Hall's point echoes those of others, who have considered Japan as part of the semi-periphery (cf. Schiller, 1976; Wallerstein 1974) – neither part of the dominant core

in the West nor part of the victimized periphery in the East – when evaluating its media production. Even Iwabuchi's contention that Japan escaped cultural imperialism only by indigenizing American influences suggests that scholars take another look at what cultural imperialism means in a globalized media economy.

A New Look at Cultural Imperialism

Contrary to the opinion of critics of the cultural imperialism thesis, Western dominance in the Asian market has not decreased at all. Western, and predominantly US-based or -owned, cultural industries continue to dominate cultural products and media capital. Using both formal policies and informal negotiations, the global media giants have taken advantage of the rise of Asian cable and satellite – as well as terrestrial – television channels to target Asian countries, whose populations by the mid-1990s had the largest number of television sets in the world.

The US has increased its global exports of film and television programs exponentially worldwide, and to Asia in particular. According to the US Department of Commerce (2008, p. 50), US exports increased as many as 15 times between 1985 and 2007 (see Table 10.2). US imports of film and television programs increased during this same period as well, from \$76 million in 1992 to \$1,440 million in 2007, leaving a net imbalance of \$13.6 billion in 2007 (US Department of Commerce, 2008). While Japan has been the largest US trading partner in Asia, Korea, Hong Kong, India, and China have risen in prominence in recent years.

As Table 10.3 illustrates, China has rapidly increased its import of American cultural products, from only \$2 million in 1992 to \$169 million in 2007, while India has

Table 10.2 US film and TV exports, 1985–2007 (in billions US\$)

1985	1
1990	2
2001	8.57
2007	15

Table 10.3 Imports and exports of cultural products (in millions US\$)

	Imports from US in 1992	Imports from US in 2007	Exports to US in 2007
Korea	0.5	265	0.5
Hong Kong	0.5	77	7
India	0.5	58	2
China	2	169	1

increased from less than \$1million in 1992 to \$58 million in 2007. While Korea imported \$265 worth of television programs and films from the US in 2007, it exported less than \$500,000 worth of television programs and films to the US during the same year (Table 10.3; US Department of Commerce, 2008, pp. 50–51). As previously explained, the direct flow of cultural products from the US to Korea had decreased for a while; however, the import of foreign television programs and films, in particular from the US, again increased to 63.8% between 2005 and 2007, mainly due to the reduction of the screen quota system, which has resulted in the surge of Hollywood films. The market share of domestic films indeed decreased from around 62% in 2006 to 48% in 2008, when Hollywood films dominated the Korean film market (Korean Film Council, 2009, p. 4).

As such, Asian countries have provided new profitable markets for the US cultural industries. Market liberalization measures, which began in the early 1990s, increased cultural imports across the board, but did not have a significant effect on exports of cultural products to the US. These figures reflect the lobbies of US media giants such as Walt Disney, Time-Warner, and News Corporations, in alliance with the US government, which demanded that Asian countries, as well as Latin American countries, open their markets to US capital (Sparks, 2007, p. 138; Wasko, 2003, p. 213).

Asian countries used a variety of gatekeeping policies, ranging from outright bans and censorship to import quotas and the financing of domestic cultural productions, to restrict the influx of foreign media industries and content (Chadha & Kavoori, 2000, p. 428). The Chinese Propaganda Department took a series of steps to limit foreign television content as well as foreign ownership (p. 419). Korean regulations limited their television program imports to one fifth of the total, while asking domestic cinemas to screen films produced domestically up to a certain number of days per year. In Taiwan, at least 70% of the programming on terrestrial television stations and at least 25% of the programming on cable channels had to be locally produced (Chan, 1996, p. 134). It is hardly surprising that the strictest regulations have come in postcolonial Asian countries, where nation-building continues to be a critical issue (Sinclair et. al. 1996). Still, the result of these efforts has not turned the tide of US imports.

Some key examples emphasize the continuing dominance of global media industries in Asia. In Korea:

- Capital International (US) invested \$50 million in the Korean cable company On Media, which became its second largest stockholder (21.7%) in 2000 (Cho, 2002, p. 114).
- MTV (Music Television), a Viacom affiliate, established MTV-Korea as a joint venture with On Media in 2001 (Hau, 2001, p. 60).
- In 2007 Electronic Arts, the largest video and computer game company worldwide, invested \$105 million in the Korean game company Neowiz (Cho, 2007).

These examples of foreign influence, blatant in Korea, have been more subtle in China, where authoritarian politicians continue to open markets to capitalism. In 2000 China's

leaders formally declared that it would partially open its communication market toward international communication, as part of China's admission to the World Trade Organization (WTO) (Khan, 2001). However, in the decade leading up to this public admission, foreign-media power privately grew. Foreign companies could own up to 49% of Chinese video and audio distribution companies and up to 49% of companies that build, own, and run movie cinemas. Star-TV owner Rupert Murdoch, who has changed his nationality from Australian to US, and Liu Changle, a former officer in the People's Liberation Army, thus launched Phoenix as a 45/55 joint venture that would complement the Star-TV platform. While the latter continued to beam English-language sports and entertainment channels to the mainland, Phoenix had exclusive rights to air Mandarin-language movie and general entertainment channels. Phoenix, perhaps not coincidentally, emphasized news and information programming amidst China's liberalization process in 1996 (Curtin, 2005, pp. 164–165). These examples show that the Asian cultural market is not safe from Western media giants.

Global trade agreements also function to penetrate Asian markets. Whereas the International Monetary Fund (IMF) has long represented US interests in opening Third World markets (Schiller, 1999), bilateral agreements have been the weapon of choice in US trade policy. Korea, which had a 64% share of its own film market in 2006 (Korean Film Council, 2009, p. 4), lowered its own domestic exhibition quotas from 146 days to 73 days a year, in anticipation of trade talks with the US. Negotiators apparently made the cuts a precondition for a US–Korea free-trade agreement. Since the rollback, the market share of Korean domestic films fell to 42% in 2008 (*ibid.*).

How to interpret the globalization process is critical. Unlike the period from the 1960s to the 1980s, when the US strategized to dominate world media flows, US media giants in recent years have made use of local cultural resources in promoting their own products. Influenced less by a regard for national cultures than by market forces, these companies' executives realize that people prefer to watch programs in their own languages (Thussu, 2000, p. 184). Indeed, "think globally, act locally" is the business motto of Viacom, suggesting a localized business strategy in other parts of the world. Viacom's holding company MTV is a case in point.

MTV seized the opportunity to extend its power into Asia in the 1990s, by working with national broadcasters. MTV personnel cooperated with China's state broadcaster, China Central Television (CCTV), to produce the CCTV-MTV Music Awards in Beijing in 2001. Later on they worked with the Shanghai Media Group (SMG) to create the Style Awards in Shanghai (Fung, 2007b, pp. 72–73). Expressed in the localization strategy "local people, local programs," MTV sells syndicated programs made in China to stations in different Chinese cities and inserts advertising between program slots. In Indonesia, MTV localized its global product by incorporating local audience tastes:

With videos played on MTV, shows may be all or mostly of Western groups, but they are selected for (and sometimes by) Asian audiences. The list often consists entirely of Western artists. Yet there are numerous shows that offer either a mix of Indonesian and foreign artists or exclusively Indonesian artists. (Sutton, 2003, p. 324)

Together, MTV's moves have made for a profitable business model. From a critical perspective, MTV's influence can be found in media contents around the world, where scholars have associated it with rank sexuality, brutish pride, and vulgarity (see Rao, 2007).

In sum, critiques of cultural imperialism, which have identified several emerging markets as evidence of the weaknesses of the cultural imperialism thesis, could not explain the case of Asian cultural markets. Asia has developed its own cultural products and exported them regionally, but it does not overtake the dominant position of the US in media production flows. Rather, Western cultural hegemony may have decreased, while Western media industries' profitability remains healthy, if not stronger. This leaves the question of long-term and cumulative effects on the audience as an open one. As Lee (2006, p. 895) has concluded:

Local reception may render the domination of Hollywood movies around the world somewhat less ominous [in the Asian context]. Nevertheless, it is important to emphasize that local reception does not make cultural imperialism a non-issue, because the end result of increasing Hollywood dominance would still raise concerns about the increasing lack of local voices and cultural resources available to the local audience.

Perhaps, as Anthony Fung (2007b, p. 84) argues, "it is unrealistic to assume that any nation-state can maintain itself as a fortress against new and accelerated global capital flows." Transnational capital establishes no territorial center of power and does not limit itself with fixed boundaries or barriers. It progressively incorporates the entire global realm within its open, embracing, and expanding frontiers (Hardt & Negri, 2001, p. xii). The fact that Western corporations, supported by Western governments and international agencies, dominate the flows of cultural production is not a new phenomenon. Schiller even reframed his own argument to fit this new and expansive transnational reality:

The early formulation in the late 1960s of the cultural domination thesis occurred in a specific historical era. Although that period is over, this by no means indicates that cultural domination no longer exists. The difference is that national (largely American) media-cultural power has been largely (though not fully) subordinated to transnational corporate authority. (Schiller, 1991, p. 13)

Schiller's revision has been extended through case studies that point to the cultural dimensions of transitional corporate authority (cf. Boyd-Barrett & Xie, 2008; Chadha & Kavoori, 2000; Jin, 2007). For one, Sreberny-Mohammadi (1997, p. 51) argues:

Cultural imperialism is not maintaining its rule merely through the export of cultural products, but through institutionalization of Western ways of life, organizational structures, values and interpersonal relations, language. Cultural imperialism should be considered a multi-faceted cultural process.

Examples of these Western ways include: the introduction of commercial media systems; the systematic violation of sovereignty with supranational communication technologies; the mass distribution of false or systematically distorted images of poor nations for global audiences; and the schooling of foreign students to US or US-style media practices (Schiller, 1996, p. 102). Though the arc of US power is waning, US culture remains influential in countries, not only in terms of explicit contents, but implicitly in the ways in which contents are framed.

Indeed, the nature of the transnationalization of the cultural industries has significantly shifted. Western cultural industries have changed their strategies to adjust to the changing global environment. Instead of solely focusing on exporting their cultural goods, they have invested in cultural industries in developing countries. Through this strategy they are still able to dominate the world cultural market, and they can still penetrate the commercial ideologies of Western countries. Although some countries have developed their own unique cultural strategies and have avoided cultural homogenization through globalization strategies, one needs to understand that globalization is another form of Western dominance. Cultural producers in Asia have tried to cooperate with Western cultural capital and cultural content, but they hardly escape from Western influence.

Conclusion

The discourse about cultural imperialism has shifted markedly over the course of the last several decades. Both proponents and opponents of cultural imperialism have offered several important approaches, which may grow one day into a new theory of cultural flows and impacts. As the globalization of media continues, Wasko (2008) predicts that the debates about the consequences of cultural flows will inevitably continue as well. Nevertheless, one should be cautious in using any one of the critiques of cultural imperialism to dismiss this phenomenon wholesale, or to replace it with a cultural theory of globalization.

It is true that Asia has become an emerging market for media production and that many Asian-based national industries successfully compete against dominant US films and TV programs. This does not mean that the inequality and imbalance in the audiovisual service sector between Western countries and Asian countries decreases significantly. While Asia plays a key role in the regional cultural market, the dominance of the US has increased even more rapidly. The few instances in which Asian popular culture has entered Western countries only reinforce the continuing power of US culture as the rule (see Maxwell, 2003). Cultural imperialism theory maintains its rule in developing countries not only through the increasing number of Western cultural products, but also through the capital investment made in local cultural industries by Western-based transnational corporations (Jin, 2007). The US dominance of cultural industries operates not only at the level of contents but also at the

level of structures, techniques, and resources. In this light, Schiller (1991, pp. 14–15) pointed out:

American cultural imperialism is not dead. Rather, the older form of cultural imperialism no longer adequately describes the global cultural condition. Today it is more useful to view transnational corporate culture as the central force, with a continuing heavy flavor of US media know-how, derived from long experience with marketing and entertainment skills and practices.

Asia presents relatively little evidence of the demise of cultural imperialism. On the contrary, we have yet to see how cultural imperialism will manifest itself, if not intensify, through Western-based corporations operating under the guise of globalization.

Hollywood's Presence in Latin America

Production Participation to Distribution Dominance

Tamara L. Falicov

ABSTRACT

This chapter will examine contemporary film industries in Latin America more generally, to demonstrate what these industries share in common: dependence on state support to survive, and a relationship of subordination to Hollywood film, which dominates in exhibition, distribution, and, with more commercial fare, in production as well. Data concerning both production and various alliances between Hollywood studios and Latin American film industries – as reflected for instance in the history of runaway production in the region – will be juxtaposed to screen quota legislation passed in Argentina a decade later. These issues raise perennially thorny questions regarding Hollywood's history of hegemony in Latin America.

Contemporary Latin American film production has a constraining, yet sometimes enabling relationship with the Hollywood film industry. Although industries of the so-called “Trinity” (Argentina, Brazil, Mexico) flourished autonomously at various times – for example between the 1930s and the 1950s, when a robust studio system thrived in those countries – there has always been some degree of Hollywood influence or some tangible competition at economic, political, and cultural levels. The present chapter will focus on this relationship between two Latin American countries

that Hollywood has penetrated both as a viable export market and as a place where it can produce films offshore. Mexico and Argentina, which have developed film industries, will be profiled in terms of their differing finance models and of their sometimes strained, sometimes accommodating relationship with the Hollywood industry.

Historical Overview

In the film business, the relationship between Latin America and the United States begins as far back as the 1920s, when Hollywood looked to sell its motion pictures there and generated between 80 and 90% of box-office receipts in parts of Latin America (Armes, 1987: 47). Today that relationship continues. Data from 2001 show that overall grosses outside the US account for 55% of the total Hollywood studio box-office earnings and that Latin America has accounted for between 12 and 15% of foreign theatrical revenue (Toumarkine, 2001).

When European markets – historically, the largest buyers of Hollywood films – collapsed during World Wars I and II, Hollywood turned to Latin America to sell its product (see Schnitman, 1984). In 1927–1928 Latin America created more revenue for early sound features from Hollywood than Canada, Asia, and Europe combined – about 31.5% of the \$7.5 million that comprised the annual total foreign return (Usabel, 1982, p. 80).

During World War II, Mexico's film industry was aided and invested into by the Hollywood studios – the most involved one was Radio–Keith–Orpheum (RKO); and Hollywood helped train technical crew and actors in Mexico. Mexican actors such as Dolores del Río, Ramón Navarro, and Lupe Vélez crossed the Rio Grande to the US before World War II, but then they returned to Mexico in the 1930s and 1940s. They became transnational stars – stars both in the US and in Mexico – and helped popularize what has been dubbed the “golden age” of Mexican cinema, the period from 1938 to 1953. That was also an age of transnational collaboration between the two industries in the fight against communism: the Mexican B-film *Dicen que soy comunista* (*They Say I'm a Communist*) (Alejandro Galindo, 1951, Mexico), among others, perpetuated Cold War propaganda (Fein, 2000, p. 93).

Argentina, by contrast, paid heavily for its neutrality during World War II. Amidst allegations that the Argentine film industry was producing pro-Axis propaganda, the US government banned the shipping of raw film stock to Argentina. Although one studio, Argentina Sono Film, did produce pro-Fascist newsreels, most of the film industry, which at that time was the most industrialized and successful of its kind in Latin America, was democratic and supported the Allies (see Falicov, 2007). The US government, heavily influenced by Hollywood, found a strategic way to distribute US films in the region by severely weakening the Argentine film industry, which had the most developed studio system among Spanish-speaking countries at the time (Getino, 2005, p. 28).

Since the 1950s both Argentina and Mexico struggled with the loss of an industrial film studio system and had to rely increasingly on the assistance of the state to support cultural production in the face of Hollywood's dominance. During the 1960s and 1970s Argentina and Mexico produced some commercial cinema, but the landmark was a cinematic movement on the continent, dubbed the "New Latin American Cinema Movement": this was a highly politicized, anti-imperialist, low-budget cinema that arose as a reaction to the dominant Hollywood cinematic style, form, and purpose. Filmmakers during this period were experimenting with a different film language; their hope was to create a cinema of "underdevelopment" and to use it in order to raise the consciousness of the nation, rather than merely to entertain. Beginning in the 1980s and until the present day, cinema in Argentina and Mexico (as well as in most parts of the region) aimed to make fewer films, but films with higher production values, and the intention was to circulate them at home as well as abroad, in international film festivals. The films were less overtly political, and B. Ruby Rich describes Argentine cinema from that era as a shift from the "revolutionary to the revelatory" (1991, p. 14).

In 1994 the Argentine government approved legislation intended to protect the national cinema as an entity that forms part of the cultural patrimony, and also as an infant industry in need of protectionist policies. Among other measures, a 10% tax on movie tickets was instituted, to further investment in national cinema. A decade after production funds were secured, a new law was passed that was designed to strengthen national exhibition in Argentina, in response to Hollywood's long-standing film-exhibition hegemony. Historically, national films faced discrimination in theater exhibitions, where Hollywood movies would supplant national ones due to exhibitor preference. Moreover, to this day, the Latin American film market continues to be dominated by Hollywood films, which show, on average, on between 80% (current figures in Argentina) and 98% (current figures in Central American countries) of theater screens. For these reasons, in 2004 the Argentine congress enacted a screen quota measure to insure legally that national films would gain equitable screening space. Mexico passed a screen quota, designating 10% as the proportion of theater space to be dedicated to national cinema (Article 9 of the 1999 law modified from 1992); but the quota is rarely, if ever, enforced (see Ugalde, 2004).

Although Argentina has attempted corrective measures to wrestle some screen time away from Hollywood, another trend – perhaps as a response to the screen quota – has emerged from Argentina, Mexico, and Brazil, where the Hollywood majors have invested in co-production and distribution deals with Latin American film producers. Rather than relying solely on state funding or on co-production funding from Europe (usually Spain), there is currently more collaboration taking place between the Hollywood studios, represented by the Motion Picture Association (MPA) – which is the overseas arm of the Motion Picture Association of America (MPAA) – and Latin American producers. While Johnson (2005) has looked at the MPA's relationship to Brazil, this chapter will explore the Mexican and Argentine

cases. Moreover, a general overview of runaway productions will further explain Hollywood's drive for ever cheaper locations to film and post-produce in.

The History and Impact of Runaway Productions in Latin America

In addition to marketing their films throughout Latin America, "the majors" have found ways of cheaply filming runaway productions there. According to a 1999 study commissioned by the Directors Guild of America (DGA) and by the Screen Actors Guild (SGA), "runaways" (or offshore productions) increased from 14% of total US film and television productions in 1990 to 27% in 1998 (Klein, 2004). The trend continued when the number of domestic theatrical releases shot outside the country increased from 35% in 1998 to 51% in 2005, the greatest shift occurring in productions with budgets greater than \$50 million (CEIDR 2006, quoted in Davis & Kaye, 2010, p. 61).

In their edited volume dedicated to the study of runaway productions, Greg Elmer and Mike Gasher (2005, p. 2) caution researchers that studying outsourced productions needs to be tackled in a polyvalent way: "Understanding it requires consideration, at the macro scale, of economic globalization, screen aesthetics, narrative forms, and reception practices, as well as, at the micro scale, specific production communities, individual films and television programs and particular audiences." Although it exceeds the scope of this study to encompass all the facets of studying runaway productions, it is important, in this discussion of mobility in production, to understand how new technologies have enabled companies to produce and post-produce films and television abroad in an efficient manner. New technologies, such as the rise of digital cameras and affordable editing systems, have allowed companies to shoot rushes abroad and then to send them via email as file transfer protocols (FTPs), thus enabling people to shoot and edit in varying parts of the world. As long as costs are low and labor is skilled enough for the work at hand, production crews are increasingly mobile.

Runaway productions are not a new phenomenon in Hollywood's history. Historians pin the period of consistent production when US film studios opened satellite branches abroad (such as Paramount's Joinville Studios in France in 1930), where low-budget, multiple-language versions of the same film were produced in order to cater for foreign audiences at 33% below the cost of the original film produced in Hollywood (see Shurlock, 1931, p. 22, as summarized in Nornes, 2007, p. 262 n58). A decade later, Hollywood studios teamed up with the US government to promote what was known as "the good neighbor policy," through an orchestrated effort of creating Hollywood films with positive images of Latin America; these were designed to persuade Latin American nations to join forces with the Allies in World War II, and they were orchestrated through the Office of the Coordinator of Inter-

American Affairs. Examples include cartoons blended with live action films, such as Walt Disney's *Saludos Amigos* (1943) and *The Three Caballeros* (1945). These productions were filmed partly in Latin American countries, and during the period 1939–1947 roughly 84 films with Latin themes were produced (although the majority were filmed at home; see López, 1993). The actual phrase *runaway production* appears in the 1950s (Davis & Kaye, 2010), after the famous Paramount Case (or Hollywood Antitrust Case) of 1948, when the US Supreme Court ruling mandated movie studios to divest themselves from their exhibition houses (lest they continue to be monopolies). This in turn remolded the studios, which started to produce films through subcontractors abroad. During the period of the 1950s independent studios in Europe were hired in order to regain the repatriation of profits lost from European quotas and other constraints on US film exhibition there (Davis & Kaye, 2010, p. 59).

The current debates on US runaway productions focus predominantly on the Canadian case, as Canada offers the most enticing tax incentives to Hollywood producers. Moreover, compared to Latin American countries and to other non-English-speaking nations, Canada has closer cultural and linguistic ties with the US (indeed, it is not for nothing that New Zealand and Australia are key places for Hollywood crews to film in, despite the enormous geographic distance). Nevertheless, in the quest for ever cheaper labor and exotic locales, Latin America has continued to be on US film producers' radars, and it has done so by marketing its low-cost and touristic locations. Their visibility is increased through tax incentives and legislation, as has recently occurred in Mexico; through the creation of national and regional film commissions, which is being championed by both Mexican and Argentine regional governments; through presence in location conferences (such as the annual Locations Trade Show in Santa Monica, CA); and through ad placement in trade publications. For example, in the most recent Locations Trade Show, the following film commissions were present: Buenos Aires Film Commission, Durango, Mexico Film Commission, and the Mexican Locations Commission.¹

The Mexican Film Industry from the Late 1990s to the Present

Mexican cinema has struggled to survive from the 1990s to the present. Unlike other Latin American film industries, especially those of Brazil and Argentina, the industry in Mexico has not been able to push its government to create a strong funding mechanism to work as an incentive for production. Since 1997, production figures have been low (see Table 11.1).

Although state support exists under the auspices of the Instituto Mexicano de Cinematografía (IMCINE; the Mexican Film Institute), increased attention has been paid to private film companies, which, without government funding, have produced both critically acclaimed films and box-office hits. From 1997 to 2004, between one

half and one third of all the films produced in any given year were financed through 100% private monies. It is these film companies, most of them funded by wealthy entrepreneurs, that are now waking up the nearly moribund film industry. For example, the Mexican conglomerate Interamerican Entertainment Corporation (CIE) has partnered the venture-capital arm of the Grupo Financiero Inbursa (owned by billionaire Carlos Slim Helú) to create Alta Vista Films (Morales, 2001). Another company, Anhelo, is funded by chief executive officer (CEO) Carlos Vergara, who made his fortune through Omnilife, a herbal supplement company (Smith, 2003, p. 395). These production companies worked with film directors such as Alfonso Cuarón and Guillermo del Toro, who made films in Mexico, then became successful in Hollywood, but later returned to their home country to make quality films that are more personal. Currently del Toro and Cuarón are based in the US. Alejandro González Iñárritu has followed the opposite trajectory by making a hit film in Mexico, then directing in Hollywood. *Y tu mamá también* (Alfonso Cuarón, 2001, Mexico), produced by Anhelo, *El espinazo del Diablo* (*The Devil's Backbone*; Guillermo del Toro, 2001, Mexico), also produced by Anhelo, and *Amores perros* (*Love's a Bitch*; Alejandro González Iñárritu, 2000, Mexico), produced by Altavista, are small, artistic films that gained critical acclaim in arthouse circles abroad and were equally successful at the domestic box office. For the most part, lower-budget films such as these get limited US distribution, if any. In Cuarón's case, however, the independent US film distribution company Independent Films Channel (IFC) distributed *Y tu mamá también*, which became the most widely distributed foreign-language film in recent US history (Plasencia, 2004).

The three directors of these films are friends and have remarked in interviews that they feel ostracized from the traditional film community for going to Hollywood (Puig, 2002, p. 14D). They do not lament the loss of state funding for films: according

to del Toro, private funding signals that “that whole fossilized approach has now been overturned, thank God,” and Cuarón states his preference for private-investor finance over what he deems “corrupt Latin American governments” – by which he refers to the old-guard ruling-party politics of the once dominant PRI (Institutional Revolutionary Party) of the 1990s (quoted in Brooks, 2002). This reformist stance is partly a reflection of the so-called “new” (conservative) government party or National Action Party (PAN), which swept to power in 2000; but it is also these directors’ defense against criticisms that people in the film establishment have leveled against them. In the Mexican press, *Y tu mamá también* was jokingly renamed “Hombre, Where’s My Car?” or “Latin American Pie,” which implicitly likened it to recent Hollywood teen movies. Clearly some members of the established film community do not approve of national filmmakers having close ties to Hollywood. Cuarón stated: “Of course, I’m not going to defend America’s attitude toward Mexico. Historically it is a very tense relationship. But you have to be pragmatic. Why should I turn down American distribution?” (quoted in Brooks, 2002). These newer directors share similarities with the transnational figures that helped fortify the golden age of Mexican cinema, such as directors Roberto Gavaldón and – notably – Emilio “El Indio” Fernández, who spent time in Hollywood in the 1920s and 1930s and learned their trade there (García Riera, as presented in Tierney, 2003, p. 227). There is therefore no lack of irony when those in the film establishment criticize the newer directors for working in Hollywood, while they themselves wax nostalgic over the bygone days of a more “authentic” Mexican cinema. These current directors represent a new, more youth-oriented film culture that, while not without its controversies, has helped revive Mexico’s ailing industry.

The MPA in Mexico

Mexico is the number one market for the US audiovisual industry in Latin America, and it is ranked tenth by MPA member companies among all foreign markets (MPAA, 2005). The MPA has played an important role in producing and distributing commercial films made in large part by “industrial *auteurs*.” These directors work with multinational, corporate-owned production companies and produce television commercials in addition to film. Among the reasons for this involvement, apart from the desire to diversify the Hollywood portfolio, is the need to respond to nations that demanded cultural exceptionalism during the Free Trade of the Americas (FTAA) agreements. As a way of appeasing this sector and as an attempt to make a profit at the same time, the MPA began to collaborate in cultural production with the three most developed film industries in Latin America – Mexico, Argentina, and Brazil – to demonstrate how “the production and distribution decisions of MPA member countries also reflect this commitment to cultural diversity” (MPA, 2003).

In the case of Mexico, the MPA, via studios such as Disney, Warner Bros., Fox Universal, and Columbia TriStar, has produced, co-produced, and distributed film

and TV programs throughout the Americas. The films co-produced with Hollywood studio money generally have very low budgets by Hollywood standards (typically between \$1 million and \$2 million dollars). Most Mexican films that receive co-production funding from Hollywood studios are relatively expensive by Latin American standards and they tend to be, not “quality” productions, but rather popular movies that appeal to younger, upwardly mobile, upper-middle-class audiences – the sort of audiences that enjoy comedies and trendy urban youth culture (described below). It is these very films that make money at the box office, but that are not being exported to film festivals for world recognition.

Mexican co-producers stand to gain from Hollywood involvement; in addition to the money invested, they also receive greater exposure from the wider distribution that the Hollywood studios command. For example, Miravista, the company co-created by Walt Disney Latin America and the Spanish telephone company Admira, signed the Argentine director Gabriela Tagliavini to direct its first Mexican co-production, *Ladies’ Night* (2003, Mexico) along with Mexican producers Televisa Mexico and Argos Communication. This film, produced to the tune of \$1.6 million, is a comedy about a woman who runs away with a male stripper on the eve of her wedding. According to *Variety* magazine, *Ladies’ Night* reached number one at the box office in 2004 and was the second largest box-office hit in Mexican film history despite receiving little critical acclaim (O’Boyle, 2005). According to Mexican film statistics, the film was the eighth largest box-office hit from 1999 to 2004, with 2.2 million viewers (Cazares, 2006b).

Hollywood studios have been willing to distribute films after the latter have demonstrated success in their home territory. For example, Mexico’s largest box-office hit of all time, *El crimen del Padre Amaro* (*The Crime of Father Amaro*; Carlos Carrera, 2002, Mexico), claimed 5.2 million viewers before being picked up by Sony Pictures Entertainment. This film outdid the previous record, held by *Sexo, pudor y lágrimas* (*Sex, Shame and Tears*; Antonio Serrano, 1999, Mexico), a film distributed by Fox studios (MPA, 2003). In 2009, the top six Mexican box-office hits were distributed by the US companies Universal, Fox, Warner Brothers, Disney, and Sony, selling a total of more than 11.4 million tickets domestically (Young, 2009). The smash hit that year, *Rudo y Cursi* (Alfonso Cuarón, 2008, Mexico) was distributed by Universal and became the third biggest box-office hit of all time, with 3 million viewers (CANACINE, 2012).

Mexico as Hollywood’s Backlot

Despite the fact that government subsidies and incentives for film industry investment have not materialized in Mexico (to the same extent as they have for the private sector in Brazil, for example), there has been an attempt to encourage multinational investment by legislators. In 2004, Mexico created a 15% Value Added Tax (VAT) rebate on local film production services, on condition that they contract with a Mexican production service or a local producer (De la Fuente, 2004, p. 18), but by

September 2005, despite approval from Congress, the government still had not issued the operating regulations for this tax incentive to draw Mexico's industrial wealth into filmmaking (O'Boyle, 2005). Anna Marie De la Fuente has argued that international producers have long been trying to convince Mexico to offer filmmaking incentives. They believe that Mexico, despite its proximity to the United States, has lagged behind Canada, and even behind New Zealand, because it offered nothing, fiscally, to producers. However, in recent years, there have been a handful of Hollywood films shot in Mexico, due to its lower cost options for higher budget blockbuster movies. Some of these US film studios have financed runaway productions such as the famous mega-blockbuster *Titanic* (James Cameron, 1997, US). More recently, in an attempt to lure Hollywood producers back to the country after a rash of drug gang violence in 2008–2009, an initiative was announced in March 2010, when President Felipe Calderón's administration rolled out a new policy of cash rebates. The initial funding pool of \$20 million offers 17.5% rebates on Mexican shoots, in a combination of cash rebates and sales tax refunds (Hopewell, 2010). This policy also came out as a way of competing with other Latin American countries such as Colombia, Costa Rica, and Puerto Rico, which are currently offering deep cash rebates and highly competitive pay scales to foreign producers (Young, 2010).

The contemporary history of Hollywood filming in Mexico purportedly began when *Night of the Iguana* (John Huston, 1964, US) was filmed in the once sleepy town of Puerto Vallarta. The transformation of the town into a tacky commercial and tourist destination has been attributed to the film's fame. Restaurants and bars with the film's name cash in on the tourist market, and in 1999 the set of the film was resurrected into two theme restaurants based on the film (Koehne, 1999). During an earlier period, Hollywood westerns such as John Ford's *Treasure of the Sierra Madre* (1948) were partially filmed in Mexico, on account of the landscape (which was faithful to the western genre) and of geographic proximity to Hollywood. Beginning in 1954, over 100 Hollywood films were shot in the northern Mexican city of Durango. In that year a film commission was founded at Durango, and films such as *White Feather* (1954), *The Magnificent Seven* (1960), *The Wild Bunch* (1969), and *True Grit* (1969) were filmed there.

Big-budget productions of summer blockbusters didn't return to Mexico until the mid-1990s, when *Titanic*, the most expensive film in history (\$200 million), was filmed at a huge custom-built studio in Rosarito, Baja California Norte (Hawley, 2004). Director James Cameron built a 775-foot replica of the ship, 10% smaller than the real one, and a 17-million gallon tank to sink it in, within a 40-acre complex that Fox set up in Rosarito (Masters, 1997). According to the Mexican government, the film injected \$85 million into the local economy. The facility, now dubbed the Fox Studios Baja, has since produced *Master and Commander* (Peter Weir, 2003, US), *Pearl Harbor* (Michael Bay, 2001, US), and other special effects spectacles. More recent films include the comedy hit in both the US and Mexico, *Beverly Hills Chihuahua* (Raja Gosnell, 2008, US).

What are the advantages for Hollywood studios? Wages for Mexican film crews are about one quarter of those of their US counterparts, according to Hugo Alonso

Reyes Mejilla, secretary for technicians in the Union of Cinema Production Workers (Hawley, 2004). Labor costs for the Hollywood studios are cut by one third (Tegel, 2002). The Mexican government benefits from a potential influx of money, including tourism dollars generated by having images of the Mexican landscape projected globally. In addition, the presence of Fox Studios Baja has helped develop a theme park element to the studio (following the production of *Titanic*), which has promoted tourism. As Ben Goldsmith and Tom O'Regan note:

Fox Studio Baja, for example, has clear synergies with efforts to build on the tourism potential of the Baja California region, which is acknowledged in the development of the "Foxploration" studio tour. The Rosarito site was chosen primarily for its geographic location – close to the Southern California epicenter of English-language audiovisual production – but also perhaps to take best advantage of incentives and advantages to locate in Mexico under North American trade rules. (Goldsmith & O'Regan, 2005, p. 26)

Still, not all was successful in the field of labor relations within Fox Studio Baja during the filming of *Titanic*. For example, the shooting schedule ballooned from 138 days to 160, and crew members complained about long hours and difficult working conditions. This was punctuated by a food-poisoning incident with phencyclidine (PCP)-laced chowder that sent cast and crew members (including Cameron) to hospital (Graham, 1997, p. N1). Union leaders in Los Angeles labeled the Fox studio production nothing more than a *maquiladora* and lamented that, "in exchange for NAFTA (North American Free Trade Agreement)-sanctioned subsidies from Canada and elsewhere, the studios have turned their backs on their own community and have engaged in the wholesale destruction of the Hollywood jobs base" (Bacon, 1999). In 2007 Fox sold the studio in Baja to Baja Acquisitions, a group of private investors; then it was dubbed Baja Studios, a film studio and tourist destination, not unlike its earlier incarnation.

In an age of mobility and when many countries are competing for lucrative Hollywood productions to come and film, having a low paid but skilled workforce might prove to be a competitive advantage, paving the way for more specialized local technicians to work on future projects. Goldsmith and O'Regan discuss this fierce competition among various countries that build state-of-the-art facilities with the aim of giving competitive bids to foreign countries:

Studios and places are now competing against each other on the basis of their ability to provide a range of generic skills, services, and expertise to individual films, augmented by what are claimed to be unique or compelling local advantages – the availability of state-of-the-art studio infrastructure, particular creative individuals or firms, and the proximity to specific locations. (Goldsmith & O'Regan, 2005, p. xii)

One reason why these nations have created policy initiatives and have coordinated with subnational (e.g., regional and municipal) governments to provide such com-

petitive bids for what Canada calls “foreign service production” (Elmer & Gasher, 2005, p. 5) is to obtain financial investment, which is the bottom line. It is projected that nearly 20% of all out-of-state production budgets are spent within the local economy. More specifically, the following businesses are hired when a foreign shoot comes into town: labor, transportation, lodging, car and truck rental, motor fuel and service stations, food and beverage companies – to name only a few (Gnuschke, 2005).

On the downside, Davis and Kaye (2010, p. 58) state succinctly that there are three risks that host countries need to be concerned about if runaway productions are the main avenue by which indigenous production can be developed: opportunity costs; integration with Hollywood; and the race to the bottom. Moreover, there may be power dynamics between the foreign and the local crew that reflect hierarchies in the global world system. This happened for example when Roger Corman’s production company worked in Argentina during the 1980s to make nine low-budget films of varying genres. Argentina was chosen at a time when the economy was faltering and costs were extremely low. According to production designer María Julia Bertotto, during the filming of a sword and sorcery film, Corman’s above-the-line crew acted offensively toward the Argentine crew. She recalled that some members of the US crew felt uncomfortable working with the locals, despite the fact that many of the latter spoke English. She remembered that Corman’s people “essentially gave orders and refused to hear our suggestions. It was as though they had preconceived notions of Argentina and thought we were ‘Indians with feathers on our heads’” (Bertotto, interviewed in Falicov, 2004, p. 33). Another problem stemmed from the plan to market the film for the anglophone market. In *Wizards of the Lost Kingdom* (*La Guerra de los magos*, directed by Héctor Olivera, 1985), the credits for the film had the Argentine names changed to anglicized pseudonyms; this was suppose to give the film a better chance of selling in the English-language market (for example, Américo Ortiz de Zarate’s name was changed to Andrew Sargent; *ibid.*, p. 34).

This power dynamic raises the following questions: Do countries such as Mexico and Argentina thrive, or do they get exploited under these conditions? In the example of the unskilled crew working on *Titanic*, most crew members were overworked and underpaid. In other situations, however, having an international crew composed of specialized technicians may provide an opportunity for locals to learn new skill sets; hence it may promote technology transfer. As a counterexample to the one above, using Corman as a test case, there were some positive outcomes: Film critic Diego Curubeto recounts from interviews how Argentine visual effects technician Alex Mathius and makeup artist Jorge Bruno never had the opportunity to work in the fantasy genre of film until Roger Corman came to Argentina in the 1980s to make films such as *Deathstalker* (1983). They gained valuable expertise by learning the craft from veteran special effects makeup artist John Carl Buecheler (whose credits include numerous B movies and horror films such as *Halloween: The Curse of Michael Myers*, 1995; Curubeto, 1993, p. 155). Therefore it is not a simple equation of costs and benefits when a foreign film crew goes to another country to make a film. Each case

may vary; some local industries will benefit, and some workers will be exploited. Others may gain valuable technology transfer skills. Taking a cue from the Canadian case, where there has been a longer track record, Charles Davis and Janice Kaye conclude that one must distinguish between two different kinds of home-grown production: one is production capabilities, such as below-the-line crew positions, and the other is the higher order film and television “business and creative capabilities.” The authors argue that both are needed for a local film industry to thrive, but in the case of runaway productions there is a strengthening of the crew training and economic stability of the former, although there isn’t so much advantage for local production houses or firms (Davis & Kaye, 2010, p. 58). In the two aforementioned Corman cases, there were winners and losers in the same runaway production scenario. In a nutshell, the benefits of runaway production help a host country if there are enough resources (cash that stays in the country, being spent on salaries and services) and skill sets honed in to allow for improved technical training of the local crew; and, over time, this might help the local film infrastructure to be invigorated in terms of new studios, post-production facilities, and so on, as a form of investment with potential for local films to be produced *in situ*.

The Argentine Film Industry from the Late 1990s to the Present

Argentina’s film industry, which had very low production figures in the early 1990s, saw a revival in production after the passage of the 1994 Ley de Cine 24.377 (Film Law 24.377), which entitled the Instituto Nacional de Cine y Artes Audiovisuales (INCAA; National Institute of Film and Audiovisual Arts) to additional sources of film-production funding (see Table 11.2). Despite the 2001 economic crisis, the biggest to beset Argentina in decades (it was the largest default on an International Monetary Fund loan in world history), the film industry did not falter. This was in part due to the creativity of newer directors (many of them recent graduates of film schools), who made films on a shoestring that have gained worldwide festival accolades (see Falicov, 2003a). Fifty-one films were produced in 2004, the highest number in decades. Over the second weekend of October 2005, three national films – a police comedy, *Tiempo de valientes* (*On Probation*; Damian Szifron, 2005, Argentina), a Falkland Islands award-winning drama, *Iluminados por el fuego* (*Blessed by Fire*; Tristan Bauer, 2005, Argentina), and the old-age romantic comedy *Elsa and Fred* (Marcos Carnevale, 2005, Argentina) – took nearly 45% of the 370,000 total admissions, compared to an average 10–15% share of the market for the same time period the previous year (Newbery, 2005b). By 2009, the top grossing film that year, *El secreto de sus ojos* (*The Secret in Their Eyes*; Juan José Campanella), brought in 2.4 million viewers, drawing in an astonishing 45% of all the audience members who went to see Argentine cinema that year (Russo, 2010). This film was highly popular before it won the Oscar for Best Foreign Film (it was the second Latin American film to ever win in the history of the Oscars), but

Table 11.2 Number of Argentinean films released, 1997–2009

Production year	Films
1997	28

winning this prestigious accolade probably helped garner such a high number of viewers. The film beat out the Hollywood hits for that year, *Ice Age 3* (1.9 million viewers) and *Harry Potter and the Half Blood Prince* (1 million).

Argentina's film output ranges from low-budget independent films to glossier, more commercial films with budgets of \$1.5 million to \$2 million. These more mainstream films are produced by industrial auteurs who work with multinationally owned production companies such as Pol-Ka and Patagonik. Both these companies are partially owned by Buena Vista International, the distribution arm of Disney (Patagonik also receives investment funds from Telefónica Media, a massive Spanish telecom company). Pol-Ka produced a popular action film, *Comodines* (*Cops*; Jorge Nisco, 1997, Argentina), which was billed as "the first Hollywood blockbuster spoken in Spanish" (*Clarín*, 1997). It utilized television stars, special effects, product placement, and the buddy movie genre; and it drew record numbers of filmgoers. It irked some to know that this film received state subsidies despite being produced by a production company owned by a multimedia conglomerate (see Falicov, 2003b). Buena Vista International/Disney has actively co-produced and distributed films that have commercial potential, such as famed director Marcelo Piñeyro's *Kamchatka* (2002, Argentina/Spain), or the comedy *Cohen vs. Rosi* (Daniel Barone, 1998, Argentina). Two animated films for children were highly successful, and both were distributed by a Hollywood "major": *Patoruzito* (José Luis Massa, 2004, Argentina) was distributed by Buena Vista International; and Columbia pictures distributed *Manuelita* (Manuel García Ferré, 1999, Argentina).

Argentina has witnessed worldwide acclaim with films such as *Nueve reinas* (*Nine Queens*; Fabián Bielinsky, 2000, Argentina) and *El hijo de la novia* (*Son of the Bride*; Juan

José Campanella, 2001, Argentina), both of which were picked up for US distribution by Sony Pictures Classics. Dylan Leiner, senior vice-president of acquisitions and productions, stated that *Nueve reinas* appealed to Sony because it broke the stereotype of traditional Latin American cinema. "It was very smart and fast-paced. The broader comedies in Latin America don't usually work as well because they feature local television stars or address regional issues. We look for stories that have universal appeal and are easy to understand" (O'Brien & Ibars, 2004, p. 42). *Nueve reinas* was remade by Hollywood as the mediocre *Criminal* (2004, USA), directed by Gregory Jacobs for Warner Independent Pictures.

Although the economy faltered in 2001, causing the Argentine peso's value to plummet, this outcome, paradoxically, brought new opportunities for filmmakers and for television and commercial production companies. The shift from the Menem era, when the peso was pegged to the dollar (1:1 ratio), to a depression-era situation where the ratio was 4:1 (and it is currently 3:1) has meant that US and European producers found the prices to be extremely competitive. For example, in 2003 a television commercial company in Miami that caters to the US Hispanic market saved more on costs by hiring a local crew in Buenos Aires to shoot and post-produce a *Pollo Loco* commercial. Because the day-rates were very reasonable and the level of skill was very high (especially that of the Argentine directors), the company simply flew in its executive producers and the client (that is, a total of seven people), and the rest was done in Buenos Aires. This was more advantageous than to film in Mexico, although the latter was a much closer neighbor to the south (personal interview with Jaes, 2007). Although the commercial advertising sector differs from film and television companies, it is an industry that has had close ties to Argentine filmmaking in Argentina since the 1960s. It has had an international reputation for highly skilled labor, and it has often served as a training ground for successful feature-film directors. Another advantage to filming in Argentina is the reversal of seasons from those of countries in the North – a "vital scheduling plus" (*Variety*, 2008).

Instead of national tax incentives for foreign companies to come and film in Argentina, there were outcroppings of regional initiatives in the mid-2000s; they were made in the hopes of attracting companies to various provinces, in the wake of the horrendous financial crisis. However, while the economic situation stabilized in Buenos Aires by 2005, it was clear that citizens in large metropolises had access to greater resources than their counterparts in the provinces. In 2001 the province of San Luis fashioned itself as an outpost for production, which *Variety* characterizes as having "pretensions to become the Hollywood of Argentina" (Newbery, 2005b). By 2004 the state had passed its own regional film law, to help provide additional incentives for filming. However, not all citizens of the province supported the use of public funds to draw film production from the outside to the region. A flashpoint that brought this disparity to the fore occurred in May 2005, when arsonists in the province of San Luis, an area already established for national video editing and production, burned down a set of the telenovela *Salvame Maria*.

This was one in a number of violent protests that occurred against the province's film program that week. San Luis was under fire because the provincial legislature approved a 10-million-dollar allocation toward film-sector development to the governor Alberto Rodríguez Saa and his brother Adolfo, better known as one of the short-lived presidents during the 2001 crisis (Newbery, 2005a). The province, dubbed "Hollyluis," has granted credits, co-production money, tax, and technical assistance to 14 films (*ibid.*). While business is booming for the film industry in San Luis and the main impetus is to create jobs, many opponents accused the Rodríguez Saa brothers of masking a poor administration under the guise of a new project of economic development. Many dissenters demanded the money to go instead to education, public health, infrastructure, and to increasing salaries for teachers and state workers (*ibid.*). Other provincial cities such as Mendoza and Rio Negro claim to be revamping their film commissions so as to attract film pesos from the capital as well as currency from abroad, but the results have yet to be seen (Minghetti, 2005, para. 9).

SOS (Save Our Screens): Enacting the Screen Quota in Argentina

In June 2004, due in part to the left-leaning atmosphere created by President Néstor Kirchner's administration, INCAA spearheaded the passage of new screen quota legislation to counter Hollywood's hegemony. It stated that movie theaters were obligated to show one national film per screen per quarter: so, for example, a 16-screen multiplex must screen 64 Argentine films per year. Another law, called the "continuity average," obligated film exhibitors to continue screening national films if these domestic productions garnered an audience attendance of between 6 and 25% per theater in a given week. This act ensured that exhibitors could not arbitrarily drop national films in mid-week, or change screening times in mid-week (Newbery, 2004). By and large, Argentine film producers do not have the funds to market their films. A Hollywood blockbuster relies on high-priced "blitz" campaigns for an opening weekend for a film, but an Argentine film usually gains momentum through word of mouth. In 2009 the law was modified to give Argentine films a minimum of two weeks in a movie theater as time to build an audience. The earlier version of the law only guaranteed one week, unless the film was a national one, with less than five copies available for screening. The justification for this – according to Mario Miranda, an INCAA account manager – was the following:

We noticed that there was a type of discrimination going on. In 2008 there were 68 films released, of which more than half – 37 – were relegated to the "alternative circuit." On top of that, of the 31 local films that did reach commercial theatres, 30 percent were taken off the marquee after the first week. (García, 2009)

Other measures enacted by the INCAA include subsidizing theaters whose national films who do not garner enough attendance to reach the continuity average mentioned above (thus allowing films to continue to be screened), and offering a cash prize every trimester to the movie theater that sells the most tickets to an Argentine film; the prize is to be reinvested in the theater itself (*Clarín*, 2009).

The screen quota issue, which was not passed into law without debate in the film community, has also been utilized in recent years by the South Korean film industry – as well as by France, Italy, and other countries, mainly European. The case of South Korea is the most famous one because of South Korean film industry's huge strides in producing popular films at the box office after the screen quota system was enforced in 1993. Korean film production rose to nearly 70% of the box office in 2004, up from 35% in 2000. This policy requires cinemas to screen domestically produced films 146 days a year and 40% of exhibition time (Lee, 2004). In 2006 the Korean government decided to heed the United States' call to delimit, or, better still, to abolish the screen quota as part of the Korea–US Bilateral Investment Treaty talks (BIT). Rather than doing away completely with the quota system, the number of days in which Korean films were required to be screened fell from 146 days to 73. This meant that only 20% of the local theaters' schedule would be set aside for homemade films (Jin, 2008). Clearly the United States, as represented by the MPAA, heavily pressured South Korea, arguing that the motion picture industry is a business and that the quota system was against the principles of free trade (Lee, 2004). The South Korean government very much wanted to resolve this issue, as Washington had urged it since 2003 to reduce the quota before the two sides met at the negotiation table for the BIT signing in 2007 (*ibid.*). Christopher Hill, the US Ambassador to Korea, warned that Korea could not have the screen quota and a free trade agreement at the same time (quoted in Jin, 2008). At stake here is whether the state has the license to regulate culture by adopting protectionist measures, a phrase that has become pejorative and stigmatized. Hence a new term has been embraced by those who support a screen quota: "exceptionism." The exceptionists are appropriating it from the rhetoric of "cultural exceptionalism," which was successfully championed by France and Canada during the 1993 General Agreement on Tariffs and Trade (GATT) against the United States. While the expression "cultural exceptionalism" has given way to the concept of "cultural diversity" (Frau-Meigs, 2003; Moisés, 2002), currently even organizations greatly influenced by the United States, such as the Organization of American States (OAS), have supported the declaration of the United Nations' Educational, Scientific and Cultural Organization (UNESCO) to protect the diversity of cultures against globalizing forces.

Jorge Coscia concludes his essay "The Screen Quota, a Fundamental Step Forward" with the following statement:

The screen quota is not a flag by itself; the real flag is the defense of our interests, our culture, our jobs, and our cinema, constantly cornered in our own market [. . .] Hence policies are tools, they are not the ends but the means. The screen quota is a funda-

mental issue, because culture is essential to a country's project. But it is also relevant because debates and discussions continue to establish new means of development, sovereignty, and growth. (Coscia, 2004)

While the screen quota may function to the best of its ability at this juncture, it may soon become ineffective – according to Harvey Feigenbaum, who argues that cultural policy tools may be undercut by changes in technology to the point where direct satellite broadcasting, data-casting, near video on demand, digital compression, video on demand and distribution via Internet streaming may create more porous borders, may allow the floodgates of Hollywood's film and television in, and – in his words – may permit to “undermine the state's effort to protect national culture” (Feigenbaum, 2004, p. 256). This author recommends different kinds of subsidies (in addition to individual subventions in production, an emphasis on distribution and marketing, and in infrastructure such as production facilities and training as the antidote for preserving the health of a small national film industry: pp. 260–261).

Another strategy for filmmakers to continue producing films with less cash on hand has been the perennial quest for co-production funding, mainly from European sources, but sometimes from other Latin American countries – and occasionally from the United States, too. Co-production funding has occurred in the region, if not in all the film-producing countries, since the very inception of cinema in the 1920s.

Co-Production Between Argentina and Spanish Autonomous Communities, Catalonia and Galicia

A novel co-production treaty between Argentina and two autonomous communities in Spain – namely between the INCAA and various cultural entities of Galicia and Catalonia – was announced in January 2005. Named Fondo Raíces de Cine (the Roots of Cinema Fund), it was the brainchild of Argentina's INCAA president, Jorge Coscia. In an interview he stated that the project arose “out of necessity, that our country and these regions create alliances to confront a film industry such as the United States, which floods the movie screens of the world.” But, as if to answer any critics who might accuse him of setting up possibly problematic barriers to Hollywood (such as the ill-fated import quota set by Perón, which effectively shut down the exhibition sector due to a lack of screen product to show), he noted: “But let us clarify that no one wants to expulse Hollywood, but rather, Hollywood has expulsed us” (Coscia, 2005a). The fund totals \$600,000 dollars, toward which each partner contributes equally. There are maximum four grants to be given out annually, and each grantee is awarded funding according to the needs of his or her film project. One of the criteria is that the projects should have the potential to be commercially viable and successful in their respective markets.

Thus far two films have come out of the Raíces de Cine fund: *No sos vos, soy yo* (*It's Not You, It's Me*; 2005), an Argentine–Catalan co-production directed by Juan Taratuto,

and *Cama Adentro* (*Live-In Maid*; 2004), by Jorge Gaggaro. Both films have performed well at the box office, but *No sos vos* has defied expectations by playing in Madrid to packed houses for two months and thus earning the status of one of the top ten films most seen in Spain this year; it had almost 350,000 spectators and box-office receipts totaling 2 million euros. It has won the distinction of being the first Argentine film in the top ten most seen films for seven straight weeks (“No sos vos,” 2005).

Coscia has stated that the impetus to initiate the Argentine–Spanish regional agreement was two-fold: (1) the economic situation has made production in the country more favorable to those companies from abroad; and (2) the box office is like a cut of Argentine beef that is “less juicy” (*menos jugosa*) than in previous years, and thus “we have to find outside business that will compensate for this” (Coscia, 2005b).

Conclusion

Since their inception, both Mexico’s and Argentina’s film industries have struggled to create a space for themselves in the shadow of Hollywood. In its current configuration, Mexico has continued to support filmmaking through IMCINE funds, but it has also seen a proportion of films being made purely through the private sector – the approach that most closely resembles Hollywood. Moreover, with the emergence of transnational film directors such as González Iñárritu, del Toro, and Cuarón, the transition to a private model has been a format that directors themselves find more efficient and less politically fraught.

Argentina’s film-industry model has differed from Mexico’s in that the state has been relatively successful at distributing grants both to small producers/directors and to production houses owned by multimedia conglomerates (including Disney and other transnational companies). Argentina has created film legislation that has strengthened the nation’s film development fund, and more recently it has passed a screen quota that seems to be functioning well at the time of writing. Argentina’s film industry is modeled more closely on European film production than on the US model. However, both Argentina and Mexico are gaining access to markets and funds through new collaborations with MPA member companies. Hollywood studios have proven thus far to be friendly to both countries’ film industries; but it remains to be seen what kind of effect this may have in the long run (for example, one can imagine the effects on the screen quota if eventually most of the funding comes from the majors). Regardless of these changes, Hollywood continues to maintain a strong foothold in Latin America.

ACKNOWLEDGMENTS

This chapter is an expanded and modified version of “Hollywood in Latin America: How Mexico and Argentina Cope and Cooperate with the Behemoth of the North,”

in Janet Wasko and Paul McDonald (Eds.), *The Contemporary Hollywood Film Industry* (Oxford, UK: Blackwell, 2008). Many thanks to Manuel Pérez Tejada for his invaluable research assistance and feedback on the Mexico portion of this chapter.

Global *Ugly Betty*

International Format Trade and the Production of National Adaptations

Lothar Mikos and Marta Perrotta

ABSTRACT

The global television landscape in the first decade of the twenty-first century is a complex terrain of contradictory developments and trends. On the one hand, there are globally successful formats and series. On the other hand, each national TV landscape presents its own adaptations of successful programs from other countries. From 2002, the Colombian telenovela *Yo soy Betty, la fea* (*I Am Betty, the Ugly One*) has traveled around the world in dubbed and adapted versions. This chapter deals with the comparative study of the original format and of four adaptations (in Germany, Russia, Spain, USA), focusing on licensing, production, and how these conditions have impacted the narrative, dramaturgical, and aesthetic structure of these different national adaptations. The global franchise of scripted and non-scripted formats as a complex network of flows and counterflows frames the chapter.

The global television landscape in the first decade of the twenty-first century is a complex terrain of contradictory developments and trends. On the one hand, there are globally successful formats and series like *Big Brother*, *Who Wants to Be a Millionaire?* – or *Sex and the City* and *Lost*. On the other hand, each national TV landscape presents its own national adaptations of successful programs from other countries. The same

audiences that are fascinated by such international programs are often looking for local adaptations of the same shows.

Within the global television market, international trade in television formats has become an important part of the business (Havens, 2006; Moran & Malbon, 2006). The “global media flow” is mainly dominated by American products (Straubhaar, 2007; Thussu, 2007). Europe is the largest export market for US films and television formats. American television programs are broadcast in more than 125 countries (Thussu, 2007, p. 15). In recent years, however, the dominant position of the American film and television industry has been somewhat undermined. “While US-based companies remain undisputed leaders in selling TV programs around the world (accounting for more than 70 per cent of all sales), Britain leads the world in the export of television formats” (p. 18). Furthermore, there are a few other film and television genres that enjoy worldwide distribution: Japanese anime, Indian Bollywood films and Latin American telenovelas (ibid.; Straubhaar, 2007; Waisbord, 2004). In the early twenty-first century, what was once a one-directional flow of films and television formats from the US toward the rest of the world has become a complex field of “multi-directional flows” (Thussu, 2007, p. 12; Bicket, 2005).

Since 2002 the Colombian telenovela *Yo soy Betty, la fea* made its way around the world (De la Fuente, 2006). *Yo soy Betty, la fea* is a telenovela written by Fernando Gaitán, produced and broadcast in Colombia by RCN Televisión (Radio Cadena Nacional, a Colombian private television network) between 1999 and 2001. It tells the story of Betty, an unattractive and unpopular but effective and professional assistant at a fashion design company, who falls in love with her charming boss. While airing in Colombia, Telemundo –one of the biggest Spanish-language American television networks, owned by National Broadcasting Company (NBC) Universal since 2002 – also broadcast the serial, which thus achieved new highs of popularity among Latino/a audiences.

The global success of this telenovela could be attributed not only to the worldwide screening of the original Colombian format, but also – and even more – to the selling of the license rights for national adaptations. The first season of the original, which was composed of 165 48-minute episodes, showed in Spain and in all Latin American countries, where it was so popular that the cast went on tour to meet fans throughout the two continents. Moreover, the Colombian *Betty* has been dubbed and broadcast in several countries in Western and Eastern Europe – Italy, Switzerland, Czech Republic, Hungary, Bulgaria, Romania, Poland, Lithuania – as well as in Central and Eastern Asia – Turkey, India, Indonesia, Malaysia, Philippines, China and Japan. RCN sold *Yo soy Betty, la fea*, as a scripted format, to several producers and distributors around the world, for local adaptations. The case of *Ugly Betty* can serve as an example of the multidirectional flow of formats in the global TV market.

This chapter deals with the comparative study of the original format and of four adaptations: those in Germany, Russia, Spain, and the US. The analysis focuses on issues of licensing and production and will investigate how these conditions have impacted the narrative, the dramaturgical, and the aesthetic structure of these dif-

ferent national adaptations. The rise of an international program market with the growth of the international format trade has changed audiovisual production cultures globally. The adaptation of formats minimizes the risk of program innovation and allows big production companies to install local subsidiaries. The formatting of TV shows made it possible to localize globally traded shows. In addition, the global television market has to face, nationally, media-literate audiences that have knowledge of different genre conventions because they grew up with television. Therefore the developments in formatting and in international format trade have a huge impact on economic and cultural practices in the national cultures in which television is produced.

The International Format Trade

The international exchange of television programming began in the 1950s, growing into a global television market characterized by intense competition for the few globally profitable programs. For, as television channels have multiplied, the market share of individual networks and their programming formats have declined. Popular formats such as *Who Wants to Be a Millionaire?* are commodities in high demand in the fight for national and global market shares. National television channels throughout much of the world have never relied on their own productions alone, but have always bought programs from other countries. Since the 1990s, however, the format trade market has taken on a new momentum, as many countries shift from public to private broadcasting systems.

The term “format” for television programs was not established until the 1990s. Albert Moran defines it thus: “The total body of knowledge systematically and consciously assembled to facilitate the future adaptation under license of the programme” (Moran & Malbon, 2006, p. 7). There is a so-called “bible” for every TV format, which covers all the information – from ratings and scheduling information to instructions for lighting, camera positions, and title sequences for the adaptation of the format.¹ Latin American telenovelas as a specific narrative form evolved from Cuban adaptations of American radio soap operas of the 1930s, whereas television soaps in the US continued the original tradition from American radio. Other genres specific to television crystallized in the 1950s. These included game shows, quiz shows, talk shows, music shows, and the like – not only in the US and Latin America, but also in Europe and Asia (see Straubhaar, 2007, pp. 157ff.). Programs that followed the conventions of these genres were distributed around the world, both licensed and in unlicensed forms.

In the mid-1980s the deregulation of television markets and the introduction of new, privately owned networks around the world created a new growth in formats, which was followed by the digitalization craze in the mid-1990s. This second wave of globalization drastically changed the international television market, more formats than ever being traded at the television sales fairs (Havens, 2006). Rising revenues

also brought changes in the power structures of the industry. As the demand for programs boomed, the number of domestically produced shows also grew in many countries. As a result, the share of US productions in almost all national television markets declined from 1972 to 2001 (Straubhaar, 2007, pp. 162–163). Reality TV flourished at the beginning of the twenty-first century. Local adaptations of shows such as *Big Brother* took the place of imported shows in network programming. The new shows were specified as a framework that consisted of an idea and its stylistic and dramaturgical realization yet left room for local adaptation. Latin American media scholar Silvio Waisbord (2004, p. 378) stated: “Format television shows ‘globalization’ at work – that is, the merits of a business ‘multicultural’ strategy that is ‘sensitive’ to cultural diversity.”

The Global Licensing and Production of *Yo soy Betty, la fea*

There were four main players in the licensing and selling of *Yo soy Betty, la fea*: RCN, which produced the original Colombian telenovela; the Mexican conglomerate Televisa; Sony Entertainment; and FremantleMedia. Whereas Sony produced and licensed the Indian and Russian adaptations, FremantleMedia sold the license to Belgium, Bosnia/Croatia/Serbia, Germany, Greece, Italy and the Netherlands. It also licensed the German adaptation to Hungary and the Bosnian/Croatian/Serbian adaptation to Poland (*BrzydUla*). This example makes clear that every scripted adaptation of another scripted format is a series in its own rights. The rights of every single local adaptation of *Yo soy Betty, la fea* could be sold and licensed for adaptation to other territories. Televisa was involved not only in the production of the Mexican adaptation, but also in the productions made in Brazil (*Bela, a feia*), in China (*Chou nū Wu Di*), and in the Philippines (*I heart Betty la fea*). The Chinese adaptation was produced in cooperation with local producers and with RCN. The Colombian broadcaster and producer also sold the license to the Czech Republic (*Ošklivka Katka*), Vietnam (*Cô gái xấu xí*), and Turkey (*Sensiz olmuyor*).

The success of the original telenovela has pushed some producers to create their own versions of *Betty*, but without buying the rights. TV Azteca in Mexico first produced a telenovela entitled *El amor no es como lo pintan* (*Love Is Not as They Depict It*), followed by the Venezuelan version *Mi gorda bella* (*My Sweet Fat Girl*). These *Betty*-inspired versions saw local adaptations as well. The Portuguese *Tudo por amor* (*All for Love*) and the Israeli *Esti Ha'mechoret* (*Ugly Esti*) were adaptations of *El amor no es como lo pintan*, and the Malaysian adaptation, *Emil Emilda*, is based both on the Mexican TV Azteca version and on the Venezuelan one. In total, the Colombian original saw 12 licensed adaptations, 1 cancelled adaptation in Italy, and 5 unlicensed remakes.

Televisa first bought *Yo soy Betty, la fea*, which it reproduced under a slightly different title, *La fea más bella* (*The Most Beautiful Ugly Girl*). Meanwhile, Sony was the first corporation to buy the license to adapt *Yo soy Betty, la fea*. The company took advantage of the fact that RCN was not aware of the serial's potential as a scripted format.

RCN had not even developed a “bible.” Sony produced the series in India (*Jassi jaisi koi nahin* = *There Is No One Like Jassi*, 2002) and in Russia (*Ne rodis' krasivoy* = *Be Not Born Beautiful*, 2005). Both these versions successfully “garnered prime-time audience shares ranging between 35 and 40 percent” (Alvarado, 2006). In 2005, FremantleMedia bought the adaptation rights for the European market. The first adaptation was *Verliebt in Berlin* (*In Love in Berlin*, 2005–2007), in Germany.² FremantleMedia has sold rights for versions of this adaptation. A dubbed copy sold under the title *Lisa csak egy van* (*There's Only One Lisa*) to Hungary, where it aired in 2006. The same version was dubbed in French. Entitled *Le Destin de Lisa* (*Lisa's Destiny*), it was broadcast on TF1, on the Belgian RTL-TVI, and on the Télévision Suisse Romande. In Slovakia, the series aired under its original title, *Verliebt in Berlin*, on TV JOJ. Finally, Grundy has started new productions of the format in The Netherlands (*Lotte*), Belgium (*Sara de Roose*), Greece (*Maria, i aschimi* = *Maria, the Ugly One*), Bosnia/Croatia/Serbia (*Ne daj se, Nina* = *Don't Give Up, Nina*), and Spain (*Yo soy Bea* = *I am Betty*). An Italian adaptation (*Betty, la cozza* = *Betty, the Ugly*), to be distributed by FremantleMedia, was cancelled before its broadcast.

The Russian and Indian versions of *Betty* demonstrated that adapting a Latin American script goes beyond simply translating it into a different language. Steve Kent, senior executive vice-president of international production at Sony Pictures Television International (SPTI), explained the methodology used for the Russian adaptation of *Betty*:

SPTI brought together a group of TV professionals from Russia with Colombian and American writers. The Colombian writers knew what the novela was about and worked with the rest of the team to assure that the essence of each scene was captured, but with a Russian flavor. That was the real trick and it was hard work. (Alvarado, 2006)

The German adaptation won the Rose d'Or award in 2006 for showing a different method of reworking the story. “While the Russian version remained true to the comic ingredients of *Betty la fea*, the German version [. . .] was completely different. *Verliebt in Berlin's* near-feature-film production values and dramatic storytelling resulted in a huge hit for the commercial broadcaster Sat1” (ibid.).

In the meantime, Sony tried to translate the *Betty* format for American audiences. In the fall of 2001 NBC, together with Sony Pictures TV and with writer Alexa Junge (former executive producer of *Friends* and *Sex and the City*), developed a half-hour sitcom based on the telenovela (Adalian & Sutter, 2001). Despite NBC's ambitions to produce a new hit – a prime-time comedy, perhaps with dramatic elements – the project was cancelled. Yet, “during the same 2001–02 development season, ABC and Touchstone TV developed the comedy *Less Than Perfect* [. . .], which bears some similarities to the premise of *Betty*” (Andreeva, 2004). Four years later, a joint venture between the NBC format vendor Reveille Productions, Salma Hayek's production company Ventanarosa, and Touchstone Television resulted in *Ugly Betty*, a 60-minute program series for the ABC network and for a general mass viewership. Following

the show's strong ratings in the US –16.3 million viewers tuned into the season premiere, on Thursday 28 September 2006 (WorldScreen.com, 2007) – Disney–ABC International Television licensed it to several territories. *Ugly Betty* launched in the UK (Channel 4), in New Zealand (TVNZ's TV2), and in Australia (Seven Network), making its Asia–Pacific debut; in the Asia–Pacific it was the most highly rated new series in 2007.³ Through the cable channel Sony Entertainment Television, *Ugly Betty* has also returned to the same Latin America countries where *La fea* was launched.

The story of Betty is rooted in that of *The Ugly Duckling*, a fairy tale written by the Danish poet Hans Christian Andersen and originally published in Copenhagen in 1843. It has also generated youth-oriented spin-offs, such as an animated series *Betty Toons*, which was created by Conexión Creativa and was aired on the Latin American version of Cartoon Network since 2004. The series focused on the school adventures of a young Betty, her friend Nicolás, and the whole set of characters from the original telenovela – as children. In Russia, a web-only animated parody of the telenovela, called *Umanetto* (a name that recalled the company name Zimaletto in *Ne rodis' krasivoy*), targeted an audience of young adults as well.

The Logistics of Format Marketing

Against this background, format adaptations are a way to transform both fictional and non-fictional television productions into domestic ones, and thus to improve their chances of success significantly.

However, in the fragmented markets of the early twenty-first century, this is true only for some milieus and target groups, and not in general. The concept of cultural proximity also refers to linguistic regions. That is, films and television formats are easier to distribute in countries where the same language is spoken. Films from other linguistic regions are adapted by dubbing or subtitling. The introduction of digital versatile discs (DVDs) has made it possible to watch the same film in different language versions. DVDs often include subtitles in a choice of many languages. This is one way in which films can be adapted for other cultures.

There are three varieties of format marketing in the global television market (Mikos, 2002, pp. 442–447):

(1) One marketing variant entails selling *broadcast rights* for fully produced series or, more commonly, for individual seasons. These series then compete under their titles as brand names for the television networks of foreign countries. The buyer acquires the broadcast rights to a finished product and performs no modification except subtitling or dubbing. The salability of the product depends on the dominance of its format and on the openness of the narrative to interpretation. Furthermore, the narrative openness of a television series is formally rooted in the structure of its patterns. The 1980s series *Dallas* is perhaps the best known example of the sale of rights to a fully produced format. More recent examples include drama and sitcom

series such as *Ally McBeal*, *CSI: Miami*, *Emergency Room*, *Friends*, *Gilmore Girls*, *Gray's Anatomy*, *Heroes*, *Lost*, *My Name Is Earl*, and *Sex and the City*.

(2) Another type of format marketing involves selling the *rights to a series concept and a format outline*. In this variant no finished content is sold. Instead each buyer produces the series, adapting it to local conditions within the limits of the agreed outline. For example, the German daily soap opera *Gute Zeiten, Schlechte Zeiten* (1992–) is an adaptation of a Dutch adaptation of an Australian serial titled *The Restless Years* (1977–1981) (Moran, 1998, p. 109; O'Donnell, 1999, pp. 56–57). *Ugly Betty*, with its various international adaptations, is a more contemporary example.

(3) The third marketing variant is the licensing of *rights to quiz shows, game shows, and reality shows*. In this case individual programs are international brands. Well-known examples are *Big Brother*, *Next Top Model*, *The Swan*, *Idol*, and *Who Wants to Be a Millionaire*. These shows have a brand that is used uniformly throughout the world, and their presentations, from dramaturgy to character constellations to design, follow uniform rules across all adaptations. Only the contestants, the games, and the quiz questions adapt to local conditions. The uniform dramaturgical and aesthetic elements are specified in a format “bible.” The shows are then produced to the same specifications by different production companies in the various local markets.

In the global television market, series and shows are marketed worldwide. The formatting makes it easier to buy and sell new programs with a minimum of risk. Only large television markets like the US, the UK, or Germany generate revenues that cover the production costs for developing a format. Program creators located in smaller television markets must thus depend on international marketing. The advantages of format business for the television networks are self-evident. The networks save development costs, and at the same time they acquire a product that has been proven successful in one or more other national television markets. Furthermore, when networks buy a license for a television format, they acquire the corresponding expertise of the original production. Thus the purpose of acquiring format licenses is not only to obtain a product or an idea, but also to obtain the benefit of the experience gained in the production and broadcasting of the format in other local television markets.

The format trade allows a global networking of the market participants, including the television broadcasters, media conglomerates, license and format traders, and production companies. For example, the quiz show format *Who Wants to Be a Millionaire?* was invented by the British production company Celador and owned by the Dutch license trader 2waytraffic, which is a subsidiary of Sony Pictures International. Endemol produces the show in Germany, Belgium, Italy, and Poland; Synergy in India; Ma'agalot Productions in Israel; Valleycrest Productions in the US and in the Philippines; Artea in Argentina; RTL Klub Televisie in Hungary; and Danish Metronome Productions in Denmark. Metronome itself is a subsidiary of the British Shine Group, which also owned the US production company Reveille,

producer of *Ugly Betty* in the United States. The result is a global net of production companies, TV channels, license traders, and media conglomerates that are involved in the worldwide production of *Who Wants to Be a Millionaire?*.

Although the licensing market is dominated by a few large companies, there is room for independent producers. Still, the producers with the largest international revenues in the television format market, such as Endemol, FreemantleMedia, Granada, Sony Entertainment, the BBC, and Strix, are also the ones who invent and bring the largest number of new formats to market (Moran & Malbon, 2006, p. 86). Producers in this group have also become the largest distributors of formats that were invented in other local television markets, formats such as *Yo soy Betty, la fea*.

Of course, there are limitations on the free transnational flow of programming. Television regulatory policy is the prerogative of nation-states, which then influence programming; as do national television industries and production infrastructures. If a given country has few domestic production companies, then television networks in that country more likely depend on imported formats. Glocalization may localize a global format, as the word implies, but it can also have drawbacks. While licensed formats may minimize the risk of a market launch, they do not offer absolute protection against flops. A format that is successful in one country may fail to address local and national differences in viewers' cultures, identities, and television-viewing habits.

Cultural Proximity and the Production of Global Formats

Joseph D. Straubhaar (1991) coined the phrase "cultural proximity" to describe the way in which countries and cultures tend to prefer their own local and national films and television formats. He developed the concept from research on cultural flows conducted in the mid-1980s (see Antola & Rogers, 1984; Hoskins & Mirus, 1988), by theorizing that audiences in local markets tend to reject films and television programs that have too little to do with their own cultural realities. He later wrote:

Cultural proximity theory argued that countries and cultures would tend to prefer their own local or national production first, due to factors such as the appeal of local stars, the local knowledge required to understand much television humor, the appeal of local themes and issues, the appeal of similar looking ethnic faces, and the familiarity of local styles and locales. (Straubhaar, 2007, p. 91)

Although his conception of culture originally referred primarily to geo-linguistically bounded entities, Straubhaar has since extended this theory to account for other differences. In modern societies, he writes, audiences have multilayered identities (p. 221), influenced not only by sociological features such as social class, age, ethnicity, and gender, but also by their milieus or lifestyles. Media consumers belong to differ-

ent communities, including “imagined” communities (Anderson, 1983), aesthetic and reflexive communities (Lash, 1994), proto-communities (Willis, 1990), subcultures (Jenks, 2005; Muggleton, 2000), and fan cultures (Hills, 2002; Sandvoss, 2005). People’s media preferences depend, among other factors, on their position in these social fields – which is influenced in turn by the specific economic, cultural, social, and symbolic capitals they have acquired over the course of their lives (Bourdieu, 1984). All of this would affect what shows television viewers prefer.

Studies that apply cultural proximity theory have yielded uneven results. Some studies (Mikos & Töpper, 2006; Straubhaar, 2007) have found that better educated and economically situated audiences prefer American television series over national ones, which led scholars to postulate that there are multiple cultural proximities between television contents and audiences (La Pastina & Straubhaar, 2005; Straubhaar, 2007). Straubhaar, for example, distinguishes between genre proximity, value proximity, and thematic proximity (2007, p. 197). Another study comparing television series preferences in eight countries found, however, comparatively few cultural differences between audiences on the basis of a number of intercultural communication dimensions, such as the individualism or collectivism of narrative themes or the masculinity or femininity of lead characters (Trepte, 2008). The study did find that audiences’ past experience with American fiction programs influenced perceptions, including whether the American series was broadcast in the original language with subtitles or was dubbed. What do these divergent findings signify for the theory of cultural proximity?

Even though the concept of cultural proximity has been refined to include various typological distinctions, it remains limited. Since viewers are not simply embedded in a general culture that is locally or nationally determined, it makes no sense to speak of “the audience” as a monolithic whole. Similarly, even with distinctions among types of representations, cultural proximity theory needs to account for different people’s experiences with different kinds of media and with their own media literacies. People in all parts of the world can interpret media codes and are familiar with media conventions. Through their visual experiences they have gained knowledge of media forms, genres, and styles. Audiences’ media knowledge also includes knowledge about specific narrative patterns and specific production elements such as camera movements, montage editing, lighting, shot framing, and more. Viewers in large parts of the world know, for example, generic patterns of soap operas, such as the heavy use of close-ups to express character emotion, and shot–reverse-shot sequences to show character dialogue. These generic visual styles must be integrated into the concept of cultural proximity.

This discussion of cultural proximity is relevant to the international television trade and local format adaptations, because they require television producers to juggle both familiar and unfamiliar elements for diverse sets of audiences. Reality shows such as *Big Brother*, *Survivor*, and *The Farm* have a common core theme, but they are dramatized in different ways in the various countries that adapt them (Mathijs & Jones, 2004; Mikos, Haible, Töpper, & Verspohl, 2001; Perrotta, 2007). Adaptations of television programs

are “(re-)interpretations and (re-)creations,” meaning there is a wide range of possible variations to retell or reproduce the spin-offs (Hutcheon, 2006, p. 172). Transcultural adaptations frequently create hybrid formats that mix together the conventions and vocabularies of different genres. Conventions and stylistic elements are not simply added, but are integrated. The integrated mode of hybridization “is exemplified by those formats where a more thoroughgoing amalgamation of styles and approaches has taken place” (Kilborn, 2003, p. 12). The local adaptations of *Yo soy Betty, la fea* are examples of integrated hybrid formats. For this reason, in our comparison of the German, Russian, Spanish, and American adaptations of this Colombian telenovela, our analysis focuses on the narrative and dramaturgical structures and on the use of visual stylistic conventions.

Method

To compare adaptations, we needed to analyze the Colombian prototype. Then, we chose two countries that seemed to be culturally distant from the Colombian telenovela, namely Russia and Germany, and two countries that seemed culturally proximate on grounds of language, namely Spain and the US, which has a large Latino population. The US also has a history of program exchange with Latin American countries, though the exchange goes mostly from the North to the South. Then, in order to compare five countries’ productions of the television series – *Yo soy Betty, la fea* (Colombia), *Yo soy Bea* (Spain), *Ne rodis’ krasivoy* (Russia), *Ugly Betty* (US), and *Verliebt in Berlin* (Germany) – we analyzed the first episode of each of the five adaptations. This approach seemed promising, because the beginning of a series must include an introduction to plot and characters. The fundamental conflicts that drive the drama are laid down in the initial episode. We also took a brief look at the second episode of each adaptation, to see whether the conflicts introduced were pursued and whether new major characters were introduced.⁴

Our analysis centered not only on aspects of representation such as the meaning of ugliness, gender, or fashion, but also on the aesthetic and dramaturgical style in which the story is presented, because we think that we will be able to identify local production styles. Our analytical orientation draws on neoformalist film analysis (Bordwell & Thompson, 1993), structural and functional film and television analysis (Casetti, 1998; Mikos, 2008), and the methods of comparative media research (Mikos & Töpfer, 2007). The focus of our analysis is always on how the stylistic elements of these TV shows function culturally. These elements include both conventions of visual aesthetics and narrative conventions that are basic elements in a production. We examined how the conflicts and the relationships between the characters are dramatized and what path the heroine follows in her development. At a first glance, the *Betty* adaptations are a classic coming-of-age story in which the heroine undergoes a metamorphosis from an ugly duckling into a beautiful swan. In

our analysis we investigated, first, how the main characters are constructed and what their relationships are to one another. Second, we studied the aesthetic–dramaturgical means by which the story is narrated at the audiovisual level used in order to get closer to local production styles.

Study Findings

All the adaptations of *Betty* around the world differed in the number of episodes in their series. They also differed in the length of their program episodes, which varied from 22 to 48 minutes. Even if there were similarities in the various local adaptations, the latter nevertheless differed primarily in three respects: (1) their staging of the main character; (2) their blending of comedy in the telenovela genre; and (3) their dramaturgy and aesthetic styles.

The name chosen for the protagonist in the various adaptations of our analysis is not always the same as the one given in the original telenovela. Spain and the US prefer to replace the Colombian Beatriz Pinzón Solano, also known as Betty, with two other protagonists: Beatriz Pérez Pinzón, also known as Bea, and Betty Suarez. In the Russian and German adaptations the names are completely different: Katya Pushkaryova and Lisa Plenske, respectively. Presumably the localization of names was necessary in order to avoid uncommon names in each of the countries.⁵

Without getting into the details of each adaptation, we can give a brief cumulative synopsis of the pilots in our sample. In all of them, Betty (Bea/Katya/Lisa) searches for work and contacts companies where she will try to get a job over the course of the episode. Her search concludes either at a fashion design company in Colombia, Russia, and Germany or at a fashion magazine in the US and Spain. The fundamental themes of each of the pilots are organized into a narrative structure that follows two storylines: (1) Betty's relations with her family; and (2) the power relations involved in the management of the company where Betty finds work. The latter, on occasion, is presented over the course of a public event (a party, or a showcase), and it is often accompanied by scrutiny from the mass media (newspapers or television services). The main event and nodal point of the plot in each first episode is the job interview; it occurs in all the adaptations except the American series, in which the protagonist is denied a job interview.

Staging of the Main Character

Whereas the Colombian and Russian adaptations introduce Betty (Katya) in very similar ways, the German, the Spanish, and the US adaptations have different introductions of the main character. In the original version, the opening is shot subjectively, through Betty's eyes. Betty's voice appears nondiegetically from outside

the screen, expressing the personality of the protagonist in an emotional way and contributing to the anticipation of the plot. When Betty finally enters the camera frame, the telenovela's heroine-to-be is finally disclosed. Her physicality thus satisfies the viewers' curiosity – is she truly as ugly as we imagined? – and produces a kaleidoscope of emotional responses. Some aspects of Betty's physical appearance jump to the eye immediately: rectangular red glasses that are a little bit too big for her face, braces on her teeth, a fringe of hair that covers her forehead in an unnatural manner, and her unquestionably old-fashioned clothes. Together, the costuming and the props make her seem much older than her 20 years.

In the Russian version, *Ne rodís' krasivoy*, the first encounter with Katya is similar to the one with Betty. Katya speaks in a slight and uncertain voice, indicating that she does not know how to behave in the present situation. When she finally comes into view, she appears to have the same startling characteristics: thick, round glasses, dental braces, messy hair, and unfashionable clothes. The head of human resources concludes aloud that she is ugly and that she dresses worse than his grandmother.

The setup and the staging of the opening minutes were slightly different in the other two adaptations. For instance, the Spanish and the German versions also open with a voice-over spoken by the protagonist, who shares her feelings about the experience she will have. However, in the Spanish adaptation Bea is immediately visible, through a close-up of her image reflected in a computer monitor. Posting a message on her blog, she addresses her readers as *queridas feo-nautas* ("darling ugly-nauts," instead of "astronauts"). Bea writes that she is tired of being watched while she walks down her street. This monologue is intercut with photographs, on the screen, of models in bathing suits and underwear, and with a quick cut of Bea. The reverse shot of her facial details (eyes and glasses, the mouth full of braces) illuminates the gaps between what is seen, what is heard, what is felt, and what is understood when Bea writes that she is *muy fea* (very ugly). At the keyboard, Bea admits how much she wants to overcome people's rooted prejudices and at least find a job as a secretary. Snapshots illustrating the most important events of her life follow. In all these scenes Bea appears to be discriminated against – not only for her looks, but also for being a little bit of a geek.

Lisa, the heroine of the German version, is also introduced, visually, through a juxtaposition that takes place during the first seconds of the episode. She is walking down the streets of Berlin behind another person of her age, but prettier. Lisa's voice is heard as she speaks of a job interview. Viewers associate the voice with the pretty character, but soon there is no doubt that the voice emanates from the ugly one in the background. The ambiguity of the first camera shot that frames them together enhances the impact of Lisa's clumsiness. Like the other Betties, Lisa wears braces, big glasses and pronounced bangs. She dresses in too large, out-of-style clothes, which look as if they do not even belong to her.

The voice-over in the later pilots cyclically return to re-emphasize the narrative through Lisa's inner thoughts and through Bea's blog, giving the Spanish and German episodes a sense of melancholy and self-reflexivity that is missing from the Colombian

and Russian telenovelas. The abrupt jump from subjective to objective narrative style in those two versions represents, through contrast, the comic yet ironic way in which the main character is created. The characters of Bea and Lisa seem to swerve into a covertly tragic register, in which the sadness of loss, the awareness of an impalpable condition of social discrimination, and the conflicts with an excessively protective family all play a fundamental role in defining the heroine.

The American protagonist Betty Suarez is a hybrid resulted from these two different characterizations of the main character. A close-up of her opens the pilot. She is overweight, donning red glasses, bushy eyebrows, and a large, sweet smile of metal braces. “Old-fashioned” would be a euphemism for her cheap and colorful wardrobe. There is no subjective camerawork; there is no voice-over. An objective narration, conducted through dialogue and action, presents Betty instead. She is shown as a gaudy curiosity; but also as a self-confident person, determined to get a job in the field of her study. Some of the themes that will be developed throughout the whole series – like the opposition of socially diverse worlds – are also shown here, but not through her subjective narration. Betty is characterized as a slightly unconventional heroine, who fights against disparities that exploit the tragic potential of her comic character.

Each of the five adaptations shows differences that are strongly related to national production cultures. Whereas the US adaptation introduces Betty’s central conflict very quickly, the original and the three other adaptations spend more time on this presentation. The similarities in the staging of Betty in the Colombian and Russian versions can be explained by the historical success of Latin American telenovelas in the Russian television market; Russian audiences knew the telenovela’s conventions. Whereas these two adaptations highlight the comic elements of Betty’s physical appearance by showing the strange reactions of people who meet her, the German adaptation introduces viewers into the more serious space of the inner world of the heroine.

The Blending of Comedy and the Telenovela Genre

It is necessary to underline that Betty’s character is construed in different ways because it is related to divergent local narrative traditions. In the Colombian version Betty is neither a victim nor a protector, neither a fool nor a villain. Although these types appear among the main characters, Betty only displays some of their characteristics – especially those of the victim and of the fool. As we have already highlighted in the previous section, the Colombian *Fea* is built in a comic register. This breaks with the genre, giving the whole series a “comic climate” that is uncommon in a traditional telenovela, because it trivializes matters of life and death (Mast, 1979, p. 9). Our aim in this section is to probe even further the signs that point to Betty’s world being a comic one, because these show the unique ways in which each of the adaptations broke with the generic narrative of the telenovela. In sum, these signs let viewers know generally that, despite Betty’s misfortunes, “the action is taking

place in a comic world, that it will be ‘fun’ (even if at some moments it will not be), that we are to enjoy and not to worry” (ibid.).

Despite her weird looks, the Colombian Betty is witty, self-ironic, self-reflexive, and deeply conscious of her being an “ugly duckling.” Instead of focusing on herself and on her problems in finding a job, she seems to feel at ease. She is Betty *la fiera* (the proud), even though she is overtly discriminated against (Collazos, 2000). In addition, nonverbal, slapstick moments based on Betty’s basic clumsiness emphasize the ridiculousness of otherwise serious situations. Her awkwardness and her ugliness – which is actually a collection of ugly details in an ordinary girl – make her audiences laugh.

In the Russian adaptation, Katya is a kind of enigmatic clown who wears bizarre clothes and has a fragile and melancholic appearance. Yet she is often comic in her gestures and expressions, especially when she is involved in recurring gags at the hands of her work colleagues. Katya is characterized by slapstick actions more than by the self-irony portrayed by the Colombian Betty.

The German telenovela portrays Lisa as a sort of alien immigrant; her main problem is how to survive in the fashion world of the big city. Bea, the Spanish heroine, is a typical geek who is teased for being an “A” student; she is unpopular with teachers and pupils alike, but she also looks the part, especially through her Groucho-esque eyebrows and thick glasses. Betty Suarez of the US version, the girl of Mexican origin from Queens, is the only overweight Betty. Clumsy and gaudily dressed, she is willing to submit to self-humiliating tests in order to be accepted in the Manhattan lifestyle environment of *Mode* magazine. The slapstick performances and clown-like pantomime of these unsophisticated but good-natured heroines fill the screen with additional visual information, which makes the narratives more meaningful. At the same time, the real-life problems of being ugly, unemployed, and repressed by the family are handled as if they were not problems.

The telenovela has its roots in a dramatic structure based on tragedy, but it seems to us that the various Betties infuse a comic climate into their telenovelas. Four out of the five adaptations (all but the US version) had a defined number of episodes leading to the happy endings, which formally classified them as telenovelas. Yet the journey to the happy ending happened through a comedic heroine, thus satisfying some audience expectations – but not all. The *Yo soy Betty, la fea* and its epigones keep progressing toward the climax of the story by planting a series of comic signs that function as plot points and predict radical changes, without becoming inscribed in a fairytale-style narrative. As a result, these adaptations of telenovelas display a more innovative style than others; they introduce highly unconventional characters and stereotype-breaking formulas in the evolution of the story. These hybridizations make the programs attractive to a wide range of audiences in their locations.

The American drama *Ugly Betty* is neither a telenovela nor a soap opera, but its genre status as a “dramedy” shares themes and plot developments with both. Romantic love stories are always at the heart of telenovelas and soap operas. The future couple has

to overcome many dramatic obstacles before it reaches the happy ending. This is also the story of *Ugly Betty*, which features melodrama combined with situation comedy elements. This combination of different genre conventions can address multiple mass audiences: telenovela viewers, soap viewers, and sitcom viewers.

Dramaturgy and Aesthetic Styles

In the four adaptations and in the original version, the tragicomic heroines are introduced in different ways, which are linked to national and local traditions of dramaturgy and aesthetics. In the visual introduction of the main character, however, there are strong similarities between the Colombian and Russian adaptations on the one hand, and between the American and Spanish versions on the other. In the Colombian and Russian adaptations, she is invisible in the opening; a subjective camera and point-of-view shots are used instead. This illustrates that these latter versions try to characterize the heroine through other people's reactions to her.

We see reactions to Betty's appearance on the faces of passers-by, security personnel, employees of the fashion company, and other applicants for the secretarial job at the company. In the Russian adaptation pedestrians comment on Katya's appearance too, although she is invisible to the viewer. In fact it is not before they are four and a half minutes into the episode that the viewers first see Betty or Katya on screen. The first shot of her occurs during her job interview, where her "beautiful" rival (Patrizia in Colombia and Viktoria in Russia) is also present. In both cases the main character appears for the first time in a medium shot, in parallel with medium shots and close-ups of the competing applicants. As the interview continues, the camera closes in on the Betties, calling attention to the features that underscore her ugliness.

In the Spanish and American adaptations, the viewer's attention is immediately drawn to Betty's appearance through close-ups of her face. After just 30 seconds, the Spanish viewers see Bea's glasses and braces, shown in an extreme close-up. In the American adaptation, the point-of-view technique is used only later in the first episode; until then, the camera favors medium shots and close-ups of the main character. The German adaptation begins with an establishing shot of Potsdamer Platz in Berlin, straight after the title sequence. The next shot shows an exit of the train station there, where the main character Lisa is one in the crowd streaming towards the escalator. Only gradually does the camera pick her out.

Sound, in the form of Betty's voice-over narration, also functions to reveal the lead character's "mental subjectivity" by giving "internal commentary reporting the character's thoughts" (Bordwell & Thompson, 1993, p. 78). The voice-over narration is a common feature in the German and Spanish adaptations. Viewers hear Lisa's voice-over narration of her arrival in Berlin and of her application for an executive assistant job at Kerima Moda. The Spanish adaptation also uses voice-over in the

opening sequence. Only the US adaptation does not present the character's subjective point of view. The US viewers, who come visually very close to the character, still remain in the position of an observer, watching the action from outside. In the opening sequences, dialogue is used to portray Betty's family relationships. Whether through an internal voice-over or through an objective gaze, the conventions in *Betty* programs guarantee viewers a focus on the main character's personality.

The Russian adaptation adheres closely to the Colombian original in its chronological sequence of events and in the way they are presented. In both versions, viewers are provided with the same initial knowledge as the protagonist about the interpersonal relationships at the workplace. As the episode continues, however, viewers soon come to know more than the heroine does, by observing other characters' actions. The Spanish adaptation even presents Bea's unconscious knowledge of the future, offering a dream sequence in which she kisses her future boss. Information about the relationships between people who work at the fashion magazine is conveyed in scenes set at the office. Flashbacks are often used in the Spanish version; this is something that the US and German adaptations avoid. The latter convey only the necessary knowledge, and they do so in the course of a linear plot. Viewers attain knowledge external to the heroine through alternating and parallel storylines.

As for nondiegetic sounds, the Russian adaptation uses them for scene transitions, instead of a music soundtrack – which is common to the other versions. Thus a similarity between all adaptations and the original is that scene transitions are announced audibly. *Ne rodis' krasivoy* avoids using music, while *Ugly Betty* and *Verliebt in Berlin* use music a lot – especially to underscore the heroine's mood, or to reinforce romantic or comic situations. Not all the music in these series is expressly composed for the series; there are also popular recordings by stars such as Kylie Minogue and Robbie Williams. All five versions have a catchy title melody.

Whereas in the Colombian original and in the Spanish adaptations visual effects are of little importance, the Russian version includes two scenes that use fast motion to identify slapstick actions. Fast motion also occurs in *Verliebt in Berlin*, where a rapidly emptying waiting room indicates that fewer applicants are waiting to be interviewed for Lisa's job opening. The episode also includes shots in slow motion, intended to heighten the drama of a tragic scene. It is also apparent, through the use of colors and light design, that the US and German adaptations are visually richer and more dynamic: the first episode is warmer in the US adaptation and glossier in the German one.

These two versions also feature a greater variety of shot lengths than the others. The German version, for example, has the camera moving through the middle of the action, whereas the Russian adaptation keeps the camera at a distance during scenes that take place in the fashion firm. One reason for this distance is that Katya is not present in the Russian firm during the events presented; she is only reading about them in the magazine, and she is pictured as being literally far away from the world of fashion. Lisa in the German adaptation is, however, present at the event,

where she serves champagne as part of a catering service. She is still outside the fashion world, as her clumsy actions make evident; but she is physically in the middle of it. The editing styles of the US and German adaptations are also more dynamic; individual scenes use more varied shots than the original or the Spanish and Russian adaptations. In *Ugly Betty* and in *Verliebt in Berlin* the visual presentation of the setting is also important, involving the prominent use of establishing shots of the New York skyline and of Berlin's Potsdamer Platz. The other versions also use establishing shots, but only to set workplace scenes, or scenes at the protagonist's home.

Concluding Thoughts on Hybrid Formats and Media Production

A thorough discussion of all the audiovisual stylistic elements – title sequences, setting, editing style, camera style, visual effects, the visual presentation of dialogue, and the soundtrack – is beyond the scope of this chapter. Nonetheless, a look at a few of the differences and similarities between the adaptations and the original is informative. Genres incorporate conventions that are familiar to audiences. Telenovelas narrate complete melodramatic stories (Lopez, 1995; Martín-Barbero, 1995). Unlike daily soap operas, which are based on endless story lines (Bielby & Harrington, 2005; Cantor & Pingree, 1983), most telenovelas are oriented towards a happily-ever-after in 100 to 300 episodes.

As closed narrative texts, [there is] a very definite beginning, middle, and end to every Mexican telenovela; what happens on the way through these states in terms of narrative involves a style and treatment of subject matter designed to make sure audiences are “hooked” enough to want to tune in every day to watch the heroes and heroines go through disaster after disaster, before somehow arriving at a happy ending. (Pearson, 2005, p. 401)

Although there are local differences between telenovelas from Brazil, Mexico, and other Latin American countries, the melodramatic tone is shared among them. This makes the stories seem serious, even though a comic subgenre of the telenovela developed, primarily in Brazil, since the late 1970s (Tufte, 2000, p. 112): since then, comedy has become an established component of telenovelas.

Yo soy Betty, la fea marks the introduction of a tragicomic protagonist whose story follows the original conventions of the melodramatic telenovela, but whose character belongs to the comic structures and to the comic climate of comedy series.

The different adaptations show different ways of mixing the elements of telenovelas and comedy. While the Spanish adaptation gives greater weight to the telenovela aspects, the German one remains close to the original Colombian in terms of proportions between telenovela and comedy components. In contrast, the US and

Russian adaptations allow the comedy elements to predominate. Kim Akass and Janet McCabe (2007) go so far as to characterize *Ugly Betty* as a “stylish US hit comedy.”

In countries where serial genres have a long tradition, it is important for local adaptations to remain true to their respective genres. The fact that the Russian adaptation follows closely the Colombian original may have to do with the fact that telenovelas have enjoyed wide popularity in Russia since the 1990s (Baldwin, 1995). By the same token, the telenovela-ization of US prime-time programs aims to capture both the Latino population of the US, which exhibits close affinity to telenovelas, and the Anglo population, which is familiar with the conventions of soap operas as well as with those of drama and comedy series.

As maintained by Antonio Savorelli (2008, p. 174): “The comic coating *Ugly Betty* gives telenovela highlights even further the exasperation of some of this genre’s features, without necessarily devaluing its ability to represent the real.” *Yo soy Betty, la fea* and its local adaptations show hybrid formats inasmuch as they integrate elements of different genres in the basic telenovela structure, including a genre shift toward the “telenovela-ization of US soap operas” in *Ugly Betty* (Bielby & Harrington, 2005). The format thus meets the requirements of the global television market, since its various elements can be mixed differently in each local adaptation without excessively altering the basic structure of the original brand. Our research shows evidence that there is a complex web of similarities and differences between local adaptations of the same format. Even a traditional telenovela like *Yo soy Betty, la fea* draws from different genres – like drama series and situation comedy, slapstick and fairy tale, soap opera and reality TV – with regard to dramaturgy, narration, and audiovisual styles. “The significant dynamic of the present era in television is adaptation, transfer, and recycling of content” (Keane, Fung, & Moran, 2007, p. 75). The various *Betty* adaptations show that it is also possible to recycle single stylistic elements from different genres and combine them in unique ways. Therefore, the more hybrid a format is, the more flexible it is to the dynamics of local adaptation and the more able it is to attract diverse audiences all over the world. Genre proximity is no longer necessary in order to ensure international success, since the format mixes conventions that are well known by audiences all over the world, as long as they have an experience of the diversity of television and film genres.

The driving force behind the hybridization of television formats can be found less in television producers’ creativity in the market than in the variety of audiences, each with its knowledge of narration and visual styles. Knowledge of genre conventions is part of the media literacy of audiences that grew up with television in their everyday life. Local adaptations have to be aware of the complexities of flows and counterflows in traveling styles. This doesn’t mean that economics are unimportant. Global media licensors like Sony Entertainment and Fremantle Media, or regional producers like Televisa are in the front line of picking up, distributing, and sometimes producing successful local formats. Therefore it is not only cultural proximity, in a broad sense, that enables and limits the adaptation of formats, but also the economic

strength of the global networks, combined with the know-how of local, regional, and global production companies. To the global flows and counterflows, we would add the “multiple flows” that are based on these cultural and economic conditions for the production of global television formats.

NOTES

- 1 A format “bible” is “the project to implement the development of the basic descriptive structure, including all elements required to execute the programme, such as the running order, the profile of the main characters (host, competitors and/or guests), a description of the set design required for the story, considerations regarding direction techniques if necessary, and any other elements required for the format’s television transposition and its optimised production” (Fusco & Perrotta, 2008, p. 92).
- 2 The German producer Grundy UFA has bought original Colombian scripts from RCN, even if FremantleMedia owns the rights for the adaptation and Grundy UFA is a subsidiary of FremantleMedia.
- 3 Other strong performances include those on Norway’s TVNorge, Malaysia’s 8TV, Singapore’s Channel 5, Hong Kong’s TVB Pearl, and Sweden’s Kanal 5, not to mention Spain’s Cuatro and Italy’s Italia1 (WorldScreen.com, 2007).
- 4 Originally we also planned to analyze the Italian adaptation *Betty la cozza*, but its production was stopped without notice.
- 5 In accordance with the theory of cultural proximity, the choice of the names for the heroines has to be close to the cultural history of the country where the adaptation takes place. Hence there were Leticia in Mexico, Jasmeed in India, Maria in Grecia, Lotte in the Netherlands, Sara in Belgium, Esti in Israel, Nina in Bosnia/Serbia/Croatia, Gönül in Turkey, Wu Di in China, Katerina (Katka) in the Czech Republic.

The Comings and Goings of Key Scenarios

TV Fiction, Culture, and Transnational Flows in Postcolonial Kinshasa

Katrien Pype

ABSTRACT

On the basis of ethnographic fieldwork with Kinshasa's evangelizing television actors, this chapter describes the shifting production and circulation of religious media in terms of key scenarios for understanding quotidian life in Kinshasa, Democratic Republic of Congo (DR Congo). It examines how and when local TV serials changed from producing a nationalist narrative toward Pentecostal interpretations of life, death, and the occult. This is related, first, to the generally increased popularity of Pentecostal churches all over sub-Saharan Africa and, second, to the South–South migration of sub-Saharan Africans. Pentecostal leaders occupy prominent positions in the production and circulation of local media. Pastors and other spiritual leaders become patrons, sponsors, and religious protectors for theater groups that produce television. The mobility of religion and of peoples has led to the spread of Nollywood films and to changing media aesthetics in Kinshasa's media world.

On the basis of ethnographic fieldwork with producers of TV serials in Kinshasa, Democratic Republic of Congo (where such serials are also called *maboke*, *théâtre populaire*, and *télédramatiques*), this chapter aims at introducing one particular anthropological perspective on TV fiction: I will show how television fiction can be studied as an important site of cultural production. Central to my analysis is the concept of

“key scenario,” one of a culture’s most vital symbols (Ortner, 2002). Until now, no anthropological research on Kinshasa’s visual media has been produced. As a relatively recent topic, the social and symbolic space of media has been researched only in the context of a limited set of other African societies. Anthropological research on visual media is especially focused on West Africa, often engaging the relationship of films and videos with religion (Hackett, 1998; Launay, 1997; Lyons, 1990; Lyons & Lyons, 1987; Meyer, 2003, 2004, 2006; Witte, 2005, 2008), with politics and the market (Lawuyi, 1997), or with the construction of local modernities (Armbrust, 1996; Larkin, 1997, 2000, 2002, 2004, 2008; Shipley, 2004; Werner, 2006).

My studies of the cultural production of TV fiction in Kinshasa have been made possible by two epistemological changes within the discipline of anthropology. First, contemporary anthropologists began to approach “culture” as something that is historical and constructed; and, second, anthropologists began to consider global flows of signs, symbols, and narratives as significant sites of analysis. These changes foreground the “anthropological turn toward the screen” that I present in the first section. This will be followed by an exploration of the concept of “key scenarios” and by a diachronic analysis of the various key scenarios that have been promoted in and through Kinshasa’s TV series since their inception. These “key scenarios” are the outcome of a fascinating interplay of local and global flows of power, people, and beliefs. Therefore the final part of this chapter offers a theoretical exploration of anthropological analyses of global media flows.

Anthropologists Turning to the Screen

For far too long, anthropologists were blind to the presence of modern media technologies in the field – technologies often brought to the field by the researchers themselves.¹ A cultural pessimism, so well expressed in the writings of Adorno and Horkheimer, is often given as an explanation for the fact that these technologies were radically absent from earlier ethnographic and anthropological accounts. Because of their implicit compliance with cultural imperialism, television, radio, and other mass media remained taboo for a long time. Media anthropology only really took off as a subdiscipline in the 1990s, when an open concept of culture was adopted (see below). At the same time, the fear of globalization made way for curiosity about the local experiences of modernity (Abu-Lughod, 1999; Ginsburg, 1994; Wright, 1998).

That is not to say, however, that anthropologists were not engaging with media before. An important example is Ruth Benedict’s research on Japanese culture, published as *The Chrysanthemum and the Sword* (1946). This research was undertaken in the mid-1940s and deliberately deployed media texts, such as cinema and documentary films, as primary sites of information on Japanese society. The reason why Benedict engaged with these media texts was the impossibility of doing “traditional” fieldwork in Japan due to World War II. Others followed her example, and, based on

novels and media texts, scholars such as Margaret Mead and Gregory Bateson studied national cultures of France, Romania, England, and others. Their research practices differed very much from current media anthropology in that participant observation and long-term fieldwork were not part of their methodology, as the name of their project indicated: *Anthropology at a Distance*.²

More significant is the research of Hortense Powdermaker (1950), who studied the production of Hollywood films while focusing on the social impact of motion pictures. Her research in Hollywood gave a rather dark image of the culture industry, paralleling the cultural pessimism of the Frankfurt School. According to a later observer, Powdermaker understood the Hollywood factory as a “brutal industry thinly disguised as art that used its technological advantage to objectify viewers and impose on them politically numbing cultural formulae” (Askew, 2002, p. 5, commenting on Powdermaker). After this research, Powdermaker left for Rhodesia (the Zambian Copperbelt) to study the reception of American films among white and black communities in the mining region (Powdermaker, 1962). Along with the economic changes that she would identify as “modernization,” she took seriously the emergence of a leisure culture that evolved around radio, movies, social clubs, dance halls, and football. Powdermaker argued that participation in these activities symbolized a desire to enter into new social worlds and served as a mediator between the old and the new (in Peterson, 2005, p. 41). Her research in Zambia was set within a paradigm that studied how societies changed from one form to another. The entrance of the “new world” through media was a phase in the creation of a new society. Hence Powdermaker did not take the complexity and the concurrence of multiple modernities as her main focus, as most anthropologists do now. But, despite this dated theoretical approach, Powdermaker’s research cannot be ignored by current media anthropologists. What visual media did and still do, in the Copperbelt and elsewhere, is to offer alternative worldviews – *possibilities*, as Arjun Appadurai (1996) calls them – that is, alternatives to local experiences. Media thus introduce the problem of social and cultural difference, create new “Others,” and enlarge the imaginary sources for the construction of identities and subjectivities.

In 1999 Lila Abu-Lughod writes:

Many of the studies of popular culture, and especially television, that I have come across are disappointing. They do not seem to be trying to offer profound insights into the human condition, or even into the social, cultural, and political dynamics of particular communities – goals anthropology has always, perhaps with hubris, set for itself. (Abu-Lughod, 1999, p. 111)

A decade later, numerous ethnographic works on media production and reception have been produced. Since the start of my research in 2002, five important readers in media anthropology have been published (Askew & Wilk, 2002; Coman, 2003; Ginsburg, Abu-Lughod, & Larkin, 2002; Peterson, 2005; Rothenbuhler & Coman, 2005). In 2004 the European Association of Social Anthropology (EASA) also created

a media anthropology network in order to group anthropologists working on written, aural, and visual mass media. The institutionalization of this subdiscipline is ongoing. Prolonged discussions on the most important themes, the most apt methodologies and the weight given to the technology itself reveal that, even today, the boundaries of the subdiscipline are still to be defined.

The major theoretical anthropological approaches toward visual media have two main strands. A first line of interest in media products follows the reflexive turn within anthropology and analyzes the “representation of the Other” in films, documentaries and other visual products. Second, research focuses on the social lives of media products (production, reception, and their social itineraries) in divergent localities. The main topics of these analyses are cultural activism, the construction of collective identities (national, ethnic, religious), and the role of the media in transnational contexts (see Ginsburg et al., 2002, pp. 11–18). I intend to contribute to this second line: the emphasis on religion, politics, and media will reveal the role of visual media in the construction of communities, and how visual texts relate to shifting power configurations in a central African capital city.

In their much cited article “Beyond ‘Culture’: Space, Identity and the Politics of Difference,” Akhil Gupta and James Ferguson (1992, p. 19) write that “mass media pose the clearest challenge to orthodox notions of culture.” The existence of a transnational public sphere emphasizes the fictitious character of the boundaries that enclose culture. Gupta and Ferguson point out that the concept of “culture” has been a difficult one for anthropologists ever since the early 1980s (p. 2). So, rather soon after the cultural turn – which began in the early 1970s with Clifford Geertz’s influential monograph on *The Interpretation of Cultures* (1973) (among other things), and which imposed a “reading” of cultures – several anthropologists began to search for the “writers” of the cultural texts, as well as for the “writing conditions.” Visual texts and regimes emerged as important contributors to the creation and distribution of cultural meanings and symbols. As Faye D. Ginsburg, a pioneer of the anthropology of media, notes: “It was evident to me that we could no longer ignore the impact of [. . .] visual media on the production of culture and of collective memory, both inside and outside of the official channels” (Ginsburg, 1994, p. 8).

These studies are in line with recent anthropological approaches that understand “culture” as a constructed concept, historical, and dependent on various power relationships. It is now acknowledged that “culture” is a concept that is continuously being redefined by those who use it, and its boundaries are continuously renegotiated (see Bayart, 2005). In an interesting article published in 1998 in *Anthropology Today*, Susan Wright analyzes how the notion of “culture” shifted over time and how it was politicized. She discerns two sets of ideas about “culture” in anthropology: an older one, which equates “a culture” with “a people” that can be delineated through a boundary and a checklist of characteristics; and new meanings of “culture,” as not a “thing” but a political process of contestation over the power to define key concepts – including that of “culture” itself. Anthropologists, too, have been actively engaged

in the “production of culture,” as Wright shows. They have drawn rigid boundaries between different groups to which they ascribed distinct cultures. These “cultures” were often perceived as being fixed and ahistorical, shared by a group of people and inspiring a coherent way of life.

Several authors (Abu-Lughod, 1991; Marcus & Fischer, 1986) have taken the critique of the “culture” concept a step further, and some have even proposed to dispose of it. Aware of the politicized use of the “culture” notion and disappointed in the homogenizing work it accomplishes, Abu-Lughod (1991), for example, prefers to “write against culture.” Only in that way can she do justice to “the complexity, the uncertainty, and contestations of everyday life and to the individuality of its members” (Abu-Lughod, 1999, pp. 13–14).

Furthermore, Abu-Lughod’s research on the production and reception of television in both urban and rural Egypt has inspired her to think “about ‘culture’ not so much as a system of meaning or even a way of life but as something whose elements are produced, censored, paid for and broadcast across a nation, even across national boundaries” (p. 122). Consequently, she prefers to pay more attention to the particular configurations of power and to the social fields that are affected by certain hegemonies and produce “culture” and discourse about “culture.” Most media anthropologists agree that an analysis of the production of media texts can shed light on the production and transformation of “culture” itself (Mahon, 2000, p. 469). Or, as Ginsburg writes (1994, p. 14), “[w]e [. . .] are challenged to comprehend the multiple ways that media operate as a site where culture is produced, contested, mediated, and continually re-imagined.”

These discussions about the definition of “culture” and how it is constructed belong to the current direction that social analysis is taking, what Victoria E. Bonnell and Lynn Hunt (1999) have called “beyond the cultural turn.” It is, however, questionable how far social analysts who embrace a practice-related and constructive understanding of the concept of “culture” have really moved away from the so-called cultural turn. Awareness of the epistemological and ontological complexities in the discourse about “culture” or “cultures” does not keep most researchers from subscribing to Geertz’ classic definition of “culture” as the webs of meaning within which people live (1973, p. 5). Indeed, complemented by the acknowledgement of the plurality of symbolic systems, of meaning makers, and of issues of power and domination, the concept of “culture” has still an important part in anthropological research (see Ortner, 1999, p. 4). As Sherry Ortner writes:

“Culture,” if it is to continue to be understood as a vital part of the social process, must be located and examined in very different ways: as the clash of meanings in borderlands; as public culture that has its own textual coherence but is always locally interpreted; as fragile webs of story and meaning woven by vulnerable actors in nightmarish situations; as the grounds of agency and internationality in ongoing social practice. All of these issues continue to assume, however, a fundamentally Geertzian view of human social life: meaning-laden, meaning-making, intense, and real. (Ibid., p. 11)

Evolving Key Scenarios in Kinois Media

Within interpretative anthropology, “culture” is constituted of symbols that can be manifest in local TV production. I argue that a diachronic symbolic study of Kinshasa’s TV production unravels the various ideas of “culture” that have emerged throughout Zairian/Congolese history. In particular, I have found Ortner’s study of a culture’s key symbols (published in 1973 and reprinted in 2002) extremely helpful for situating local TV production within the larger political and social Congolese context.

In Ortner’s (2002) analysis of “key symbols,” symbols of the kind she calls “elaborating” sort out complex and undifferentiated feelings and ideas and make them comprehensible to the individual, communicable to others, and translatable into orderly action (p. 161). For example, they are well organized and logical, and therefore they occupy a central status in a culture. Ortner identified two kinds of “elaborating symbols”: “root metaphors” and “key scenarios.” For our discussion, only the “key scenario” is important. She formulates the American key scenario – best known as “the American dream” – like this: A poor boy of low status, but with total faith in the American system, works very hard and ultimately becomes rich and powerful (p. 162). This key scenario offers a clear-cut mode of action, which is appropriate for a correct and successful living in America. More abstract key scenarios formulate local definitions of the good life and of social success and key cultural strategies to attain them.

In the course of Kinshasa’s media history,³ Congolese dramatic artists have increasingly appropriated Western aesthetics and communication systems to broadcast distinctive ideologies and key scenarios. The kind of media imperialism associated with the colonial encounter changed during the reign of former President Mobutu Sese Seko (1965–1997). In 1989, for example, Mobutu allowed two local television channels to broadcast alongside national channels. In 1996, he further liberalized media spaces, creating an opening for commercial and religious media. Pentecostal–Charismatic Christianity, already popular in Kinshasa soon after independence (1960), came to conquer both the city and the mass media. Religious dramas that had been performed in missionary-run schools and youth groups and produced through colonial radio and films now moved to the postcolonial sphere of TV fiction (Pype, 2009b, pp. 134–139). Indigenous youth who once produced the sketches now began to write screenplays and to appear in local productions. As converted and schooled subjects, they regarded themselves as *les évolués*, literally “the advanced ones.”

These political and religious transformations heavily impacted the design of local television serials, demonstrating not only the continuous interweaving of national and Western cultural values, but also the multiple forms and meanings that media imperialism can take. Kinshasa’s mass-mediatized dramas have promoted different “key scenarios” and models for Kinshasa’s people in the postcolonial period – people such as its *citizens* and its class of *évolués*.⁴ Importantly, not only did these model characters stage social ideals, but their producers belonged in their categories, too.

Citizens in TV Fiction and Nationalism

The first national television station RTNC1 (Radio–Télévision Nationale du Congo) began in 1965. It explicitly addressed its viewers as citizens freed from colonial rule. In 1967, Mobutu nationalized the press and the Catholic television channel (Téléstar). The latter belonged to the Belgian Catholic missionaries (the Scheut Fathers). It broadcast cultural and educational programs, mainly from the Belgian metropolis, although locally produced programs also started gradually to be screened. Téléstar showed films produced by fellow missionaries in particular. As had already been the case for cinema, television served as a handmaiden in the missionaries' civilizing and Christianizing endeavors. The imagined viewing audience consisted of the white missionaries who used the station to communicate with other missionaries, and also of the Congolese population as potential converts. Téléstar's name changed to RTNC2. In 1971 the national broadcasting system was called La Voix du Zaïre (The Voice of Zaire), and the name changed again in 1981 to Office Zaïrois de Radiodiffusion et Télévision (OZRT).

In this unified system, Mobutu's regime favored the production of television serials that would support his nationalization efforts.⁵ Local dramatic performers (actors, musicians, and dancers) were commissioned to screen folkloric dance spectacles and theater plays based on Congo's cultural richness. These were part of the *animation culturelle* (cultural animation, propaganda) that characterized Mobutu's early politics. In 1972, following their leader's will, the program directors of RTNC1 copied the format and title of a French television show (*Au théâtre ce soir*) that had showed in Kinshasa. In the latter program, the Frenchman Pierre Sabbagh hosted and aired images of plays staged in Parisian theaters. Interviewees who remembered the program told me that the viewers perceived the realities in those European plays as too far removed from their own lives. Yet, they said, Kinshasa's intellectual elite (the *évolués*) was eager to view these plays.⁶ To shorten the cultural distance between the Western-based plays and local television viewers, RTNC1 followed a state-inspired initiative to make a Zairian copy of the French program.

The new format was named "Theater from here" ("Théâtre de chez nous") and broadcast "local" plays. The name emphasized the embedding of the narratives in local realities. Tshitenge Tsana, who coordinated this show, invited actors to interpret plays written by Congolese dramaturges such as Guy Menga and other African writers, in particular Léopold Sédar Senghor. These plays were performed in a studio, in one setting that imitated the illusion of the theater stage. Performances of the Zairian National Theater were also aired in the same program. Zairian actors now performed classical plays like *Mundele Ndombe* (based on Molière's *Le Bourgeois Gentilhomme*), *Les Fiançailles tragiques* (Ernest Daudet), and *Le Cid* (Corneille) for the television screen. The latter performances were local adaptations of European classic plays; some remained rather close to the original while others translated it to an African context, still evoking foreign imaginary settings, unknown characters, and

Western tragic experiences. In the early days of Mobutu, classic plays showing a Western notion of the Enlightenment aired side by side on television with indigenous writers' presentations of an African world. Even if these stories appeared in different narratives and evoked different worlds, they still did not reflect the totality of Kinshasa's urban experience.

It is important to draw attention to the fact that *nous* ("we") in the program's name, "Théâtre de chez nous," suggested national unity, but it also hinted at the "African" identity of the plays in contrast to the foreign culture of the former colonizer. The origin of the screened dramas thus flirted with pan-Africanism. The initial shows portrayed an "African culture," only to narrow it, a few years later, to a national Zairian identity. Gradually, theater became domesticated, brought closer to the lived realities of Kinshasa's population.

Televised theater became fully adapted to the local urban context when the producer and writer Tshitenge Tsana faced difficulties in broadcasting a new play each week. In 1974 he gathered together local actors, several of them from the group Artistes Africains Associés, and created the drama company Groupe Salongo. The group became a national sensation. Many Kinois (inhabitants of Kinshasa) remember that streets in town were deserted as people gathered in front of television sets on Thursday evenings to see the Salongo shows.⁷ It is said that these evenings were the only times when "the town was silent." For a long time the Salongo group monopolized televised drama, facing some competition in the 1980s from two other troupes: Troupe Nzoi and Ngadiadia. Between 1985 and 1990 about 85% of Kinshasa's inhabitants followed the Salongo serials (Convents, 2006, p. 306). These programs created national stars like Ebale Mondial, Kwedy, Mopepe, Bomengo, and Masumu Debrindet. The group still exists today, although the artists have changed and some of the original actors started their own troupes.

The group's name, "Salongo," derived from the first play that the troupe staged, and it could best be translated as "collective work," which became a key concept in Mobutu's nationalizing campaign. Although the concept preceded the postcolonial period,⁸ its exact origins remain a mystery. Gustaaf Hulstaert (1971, pp. 205–206), a Belgian missionary who worked with the Mongo people, writes that the word derives from "*Is'a longo*," meaning "father of the hoe." He notes that, in the equatorial province of Botoko, between 1927 and 1933, pupils sang: "*Is'a longo, mondele maso alingi mosala, na nsima akomi biso kolangola hé hé*" ("The father of the hoe, the white man, the mason, he likes [us to] work, and afterwards, he will chase us away"). The lyrics refer to a particular colonial officer who used to be a mason but punished his prisoners with a hoe. During Mobutu's regime, the term *salongo* evoked the unity of the Zairian nation and the need to work collectively for the country's progress.

Two program directors of the national television channels during the 1970s recalled the origins of Groupe Salongo in the following way, in a personal interview from the fieldwork:

After a visit to China, Mobutu brought back the documentary film *Esprit de Yukung* and broadcast it on La Voix du Zaïre.⁹ The film shows how Chinese transformed mountains

and rocks into fertile rice fields that fed the population over three times a day. Mobutu proposed the Congolese population to follow the Chinese example, so that they could eat three times a day. (Mwana Mboyo & Pasi Samba, 2004)

According to the two former program directors, Mobutu ordered the film to be shown on national television and asked Tsana to write a play on the same topic. He created a regular theater play, which was broadcast on television and was called *Esprit de Salongo* (*The Spirit of Salongo*). Using the slogan that would become a maxim of Mobutu's labor policy, "*Salongo, Congo elingi mosala*" ("Salongo, Congo likes to work"), the ruler and the actors tried to convince the Congolese population to cooperate in the national development. After the Salongo play, Tsana wrote several other scripts that were inscribed in Mobutu's nationalist project. They portrayed a modern version of the subject: the individual citizen immersed in a national community headed by Mobutu.

The program *Mwana Nsoso* marked a turning point for Groupe Salongo, which then began producing teleserials. During the first seven years, Groupe Salongo produced dramatic stories weekly in its studio. In 1981 the producers left the studio confines to shoot outside, and they stretched the new story over several episodes. Entitled *Small Chicken* (*Mwana Nsoso*), this story was the first real serial in Congo. It dealt with the love affair between a married woman and a younger man – a phenomenon called *mario*, meaning "gigolo." This theme has recurred in popular culture and is present in the current discourses of sexuality (Pype, 2012). Focused on kinship, sociability in the work space, and gendered encounters in the urban setting, Salongo's teleserials tried to enlighten people about their (mis)behaviors. For example, the serial *The Difficulties of Finding Work* (*Pasi ya Kozwa Mosala*) portrayed a young man who, after various misfortunes, becomes an accountant at a prominent company. The main message of the story was that, through virtue, honesty, and hard work, individuals earn not only wealth, but also dignity. Such dignity, the story implies, contributes to the nation's prosperity.

The serials produced during the Mobutu era reveal a total absence of reference to divine intervention. Rather, the Salongo protagonists were represented either as cunning people or as victims of other citizens. The endings confirmed that good and bad behavior would be rewarded or punished, but not by invisible agents like God or the devil. They stressed morality in a social world where human rationality and the social effects of one's deeds should precede action. The agency of an invisible power on this world was not denied, but it was not depicted as determining all the actions and experiences either. This, however, changed drastically by the end of the millennium and in the post-Mobutu period (1997–2006), when Pentecostal–Charismatic churches became prominent players in the construction of communities and increasingly central to the process of making sense of urban life.

Born-Again Christianity and TV Fiction

The liberalization of the media system in Kinshasa accompanied the growing popularity of Pentecostal religion, and this prompted a new key scenario in media

production. In the mid-1990s Mobutu's power had declined. Kinshasa citizens began to listen to born-again Christian leaders, both in public spaces and through radio and television. These new leaders started to attack the hedonistic leisure for which Kinshasa was well known, offering conversion and exorcism as a new route to the attainment of wealth, health, and social success. The new Christian churches became a refuge for many, because they seemed to offer scripts for the future that appealed to many Kinshasans. At the same time, Kinshasa's media opened radically to a privately run system, which led to a boom in indigenous media. Today it takes only USD \$25,000 and permission from the authorities to create a private television channel in Kinshasa.

As a result, Kinshasa's local media world is a highly dynamic terrain. Wealthy families and commercial entrepreneurs operate stations (RAGA-TV and TROPICANA-TV respectively). Others are owned by political leaders for propaganda. Several channels are explicitly linked to a prophet or a church group. New local and international channels are added regularly, though the government may suspend or withdraw licenses to channel owners. International channels like TV5 (French) and DRTV (Congo-Brazzaville) also air in the city. Some of the programming comes from diasporic Congolese communities in Brussels, Paris, and Johannesburg. Several channels have permanent or semi-permanent technical staff and hosts sojourning in the diasporic communities; they report weekly about activities among the Congolese abroad, frequently showing successful Kinshasans and Kinshasa cultures abroad. In 2003 the city's population could watch 25 television channels, of which 22 were locally based. In 2010 the number of available television stations had increased to 48, of which 39 were local. These figures are significant by comparison with the total number of television channels in Congo: researchers for the Parisian Panos Institute counted 52 television channels in 2004.¹⁰

The most popular programs on all TV channels air Congolese music, local television serials, and shows featuring music and serial stars. Religious stations feature biblical stories and Christian music. Both religious and commercial channels broadcast Nigerian and Ivorian serials and talk shows in which former witches and "pagans" testify about their faith. All of Kinshasa's television channels screen American films both from Hollywood and from Christian production companies; soap operas such as *Top Models*; series like *Friends*; Chinese martial arts films; and Walloon talk shows such as *Ça va se savoir* (a Belgian show inspired by *Jerry Springer*). Liberalization sparked the production of local teleserials, designed to serve the sudden demand for content. Many established dramatic artists set up their own theater production companies. In their wake, young people created their own drama groups and introduced themselves to television channels. Now all local TV stations have several theater companies working with them. Each company produces one episode of a serial each week.

Independently of whether the sponsoring channel is government-run or private, commercial or religious, all teleserials are framed within a Pentecostalist ideology. Some theater companies have an explicit evangelizing profile; such are the Cinarc Troupe, Les Évangélistes, La Trompette, and Les Lévites. The other kind of groups,

the so-called *troupes ya mokili* (secular theater), also tend toward Christian themes. The proliferation of Pentecostal–Charismatic churches in the city during the 1990s changed the design of teleserials. Morality in the TV serials became increasingly a religious matter. Even if the serials’ producers remained committed to national progress (Pype, 2009a), the main difference introduced by teleserials stems from the proposal of a new moral order, which is inscribed in an apocalyptic postcolonial experience, as some of the titles suggest: *Le Quartier maudit* (*The Cursed Township*), *Le Tombeau ouvert* (*The Open Tomb*), *Le Cartel de l’obscurité* (*The Alliance of Darkness*), *Kinshasa ou sodomie 18* (*Kinshasa or Sodomy 18*). Although the Salongo serials had used special effects to visualize witchcraft, occult and invisible forces came to the fore in the second half of the 1990s, becoming part and parcel of almost every serial (Pype, 2012). Stock characters in the dramas include *le pasteur* (the pastor), the witch, and the fool. In the finales, the witch either confesses his or her “bad” deeds, accepting Jesus and being “saved,” or stubbornly refuses the power of the Christian God, which result in his or her death. Most of Kinshasa’s drama groups are counseled by one or more spiritual advisors. In each of their programs, they thank *Jésus de Nazareth*, a range of spiritual advisors, and their affiliated church and they give the names of the leaders of the troupe and the church. Often the actors also invite their audience to their prayer gatherings.

Kinshasa’s teleserials profess a Christian key scenario, which could be summarized as follows. Life in Kinshasa is hazardous because of the workings of the devil and his demons. They invade the domestic sphere with the help of witches. They threaten collective and individual health physically and socially. Through prayer, however, and by listening closely to the advice of pastors Christians can arm themselves against evil. Conversion to Pentecostal Christianity, confessions, and deliverance rituals are identified as important turning points in the unfolding of the plot. Christian rituals are represented as effective means of purifying society and promoting Jesus’ path. This key scenario offers success and inspires individuals to be good. Significantly, it is also expressed in the churches and in other evangelization practices (*ibid.*).

Transnational Flows

Kinshasa’s television serials are the outcome of transnational flows of beliefs, technologies, and people. Kinshasa’s media has, from its earliest days, connected the local to the global and vice versa, although in varying manners. During the colonial regime, when French television programs were broadcast in the colonies, the West was represented before local realities could be “imagined” through the imagination or the screen image. During Mobutu’s reign, the ruler ordered program directors to broadcast Chinese film reflecting his political aversion for the West and his leanings toward other Third World countries. The national adjustment of imported theater and Western communication technologies fits well in the cultural extraversion of

Kinshasa's society as a whole. Jean-François Bayart (2005, p. 71) defines "cultural extraversion" as "espousing foreign cultural elements and putting them in the service of autochthonous objectives." Apart from the Western and Asian influences discussed above, West African films have also impacted local TV serials. For a decade now, while a Pentecostal-inspired Christianity has gradually monopolized the city's public culture and social life, Nigerian witchcraft films have dominated television screens. Their influence even altered the design of locally produced television serials.

Nigerian Witchcraft Films

Nigerian witchcraft films constitute a subgenre of Nigerian films; they were shown in Kinshasa's new churches beginning in 1998 and broadcast on Kinshasa television soon after. Nigerian witchcraft films have become an essential part of the viewing experiences of Kinshasa's population, although they are only one among the various "foreign" serial and film narratives that make up Kinshasa's television programming. Most of these films emphasize the workings of the occult in daily life. They are notorious for their staging of "demonic rituals" of human sacrifices (see Okwori, 2003).

Nigeria's witchcraft films inspire serials producers in Kinshasa to the extent that local actors translate Nigerian scripts into Kinois terms. In 2005, for example, during the weeks preceding the annual Mwana Mboka Trophées (Child of the Nation Awards), when sports figures, politicians, charitable organizations, musicians, and theater groups receive awards, people asked whether the Muyombe Gauche theater group would be disqualified or not, since its latest teleserial was a copy of a Nigerian film. In addition, the only film that the Cinarc troupe has produced thus far is called *Kalaonga*, a title that resembles very much that of the most popular Nigerian film in Kinshasa, *Karichika*.

The arrival of the *films du Nigéria* is linked to the Congolese imaginary about Nigeria and to the male migration to this country, which has become increasingly important since the 1990s. Appadurai (1996, p. 3) has already remarked that media and migratory flows are interconnected. The influence of the Nigerian video films on Kinshasa's teleserials concretely depicts how mass-mediatized imaginary landscapes are not always rooted in Western hegemonic image systems, but sometimes also in alternative transnational circuits (see Larkin, 1997). Since the 1990s, the film industry in Lagos¹¹ has boomed and spread films all over sub-Saharan Africa. More importantly, Nigeria occupies an important place in the Kinois imagination, although only a small number of Kinois have actually visited the West African country. On the basis of Nigerian films and of the stories of returned migrants, Kinois perceive Nigeria as a nation of plenty, where access to commodities is easier than in their hometown. Young men consider Nigeria to be an attractive place for economic trade. Christianity, and especially evangelization, is also an important attraction, though religious and economic reasons frequently comeingle.

These intertwined issues are reflected in witchcraft films produced in Nigeria but popularized in Congo. According to many Kinois, Nigeria is the front line of a spiritual battle between God and the devil. One of my informants, Nene, told me that her aunt, who had stayed some time in Lagos, was surprised to observe people there saying incantations on beaches or in parks. She found it equally strange that magical objects could easily be purchased in markets. Conversely, many Kinois appreciate Nigerian Christian leaders for their ardent battle against the devil. Nigerian prophets are often invited to Kinshasa to perform healing sessions, and many of Kinshasa's spiritual leaders are eager to learn from Nigerian prophets. Often, when Congolese spiritual leaders return from Nigeria, they represent themselves as *des prophètes nigériens* ("Nigerian prophets"). As a result, the attribute "Nigerian" has become a quality label that guarantees strong spiritual powers and capacities. These narratives of Nigeria as a nation with "God" and with "much evil" are confirmed when Kinois watch Nigerian witchcraft films.

Though these films are spoken in English, people watch them nonetheless.¹² Understanding the dialogues is not necessary, as the actors' body language and the special effects used speak for themselves. When these films are broadcast on Kinshasa's TV channels, they are dubbed into Kinois through their own translators. Translators are always male; they interpret all the roles – of men and women, children and adults – they explain the dramatic events, and they comment on them so as to bring these "foreign" narratives closer to Kinshasa's reality. Franck Baku Fuita and Godefroid Bwiti Lumisa (2005, p. 112), two Congolese journalists, noted that these interpreters are even granted the status of spiritual leaders who not only instruct but also heal the viewers. They describe how viewers, mostly women, contacted a translator, José de Jésus, asking him to cure their sterility and other illnesses of "mysterious" origins. They write: "One woman whom we met when visiting José de Jésus confirms to have been cured of her sterility thanks to an operation undoing the *désenvoûtement* [bewitchment] [sc. – an operation performed] by the famous television host whom she came to know through the Nigerian films" (author's translation, p. 112). This suggests, again, that, for Kinois, a close connection with the Nigerian Christian world is perceived as increasing one's spiritual power.

Nigerian films travel to Congo through migratory flows – both religious and economic. Local Pentecostal preachers are important cultural brokers of Nigerian films. *Pasteur* Kutinho, leader of the revival church L'Armée de Victoire (The Victory Army), screened *Karichika* on his own TV channel (de Boeck, 2004a, p. 186). It tells the story of a young girl (Karichika) who is sent by Lucifer to the world in order to destroy humanity. She uses her beauty as a weapon to sow death and despair, and she brings disorder into households. At the end of the film, the "real" Christians are saved thanks to their strong faith, while the sinners die, and Karichika returns to the world of the devil. Today the word *karichika* designates in Kinshasa this genre of West African films that depict the spiritual combat between God and the devil.

Nigerian films also found their way to Kinshasa through many commercial activities of the Kinois abroad. Young men who migrate between the Republic of Congo,

South Africa, Angola, and Nigeria bring back home all kinds of commodities: soap, mattresses, radios, and clothes. At the age of 24, the president of the TV actors group Cinarc Bienvenu Toukebana was sent abroad by his mother. First he went to Angola for two years. Then he spent three years in South Africa, Ivory Coast, and Nigeria. In 1998 he returned to Kinshasa with a pile of Nigerian videos. With the help of his maternal cousin he sold the films in Kinshasa's streets and churches, as well as in his mother's hometown Matadi, in Lower Congo. Cassettes, video compact discs (VCDs), and digital versatile discs (DVDs) are still sold in the streets today by *bashayeurs* – boys aged between 15 and 18, who also sell local media and music. Nigerian tapes and DVDs circulate in compounds¹³ and among relatives, friends, and neighbors.

Aside from informal circuits, Nigerian video films are shown on Kinshasa's privately owned television stations. Through constant repetition, the films have become part of the town's cultural memory. Their aesthetics influence the way in which Kinois decorate their homes. According to a journalist, for example, "Kinois increasingly construct pillars and vaults in their houses as well as small gardens. The compound walls are more and more painted in orange, yellow, dark brown, and all kinds of red; thus these colors are replacing the 'traditional' ones of blue, white and color of *pierre de France*" (the "French stone," in other words red brick) (Ne Kongo, 2007, author's translation, p. 4). In the domestic sphere, conversations often deal with the contents and characters of these films; several nicknames derive from fictional characters in the Nigerian films; and domestic chores are postponed when these films are broadcast.

Nigerian witchcraft films have attracted state attention, becoming the center of a vivid and passionate public debate over the merits of broadcasting them in relation to the country's development. In my four years of fieldwork (2002–2006) the national government outlawed the films twice, through the Haute autorité des médias (the governmental censorship board). Kinois actors, the Nigerian embassy, and the Congolese state fueled the protest against this immensely popular genre. Local actors felt threatened by the success of these films. The Nigerian ambassador requested banning the films, as he feared that they gave Nigeria a bad image. Furthermore, people blamed the films for the spreading phenomenon of witch hunt, which targeted child witches in particular (see de Boeck, 2004b). Other opponents articulated concerns about the role of the visual media in the construction of national identities. They discussed the threat that foreign media products posed to the preservation of local culture, and the need to regulate the educational value of television programs. State censors, however, did not put an end to the broadcasting of Nigerian films. By the end of 2006 several new television channels began, and their program schedules were almost exclusively dominated by Nigerian films.

Studying the Flows

In their introduction to *Media Worlds*, Ginsburg and colleagues (2002, p. 14) contend that "the dominant frameworks for thinking about media's transnational reach have

been either globalization or cultural imperialism, which tend to privilege media originating from or dominant in the West, with less attention to other circuits.” The influence of Nigerian films on Kinshasa’s public culture and media production concretely depicts how imaginary landscapes are not always rooted in Western hegemonic image systems, but sometimes also in alternative transnational circuits. The role of Nigerian films and the particular history of their arrival in Kinshasa therefore create a very interesting case for the scholar who wants to study the way in which moving images reconfigure public spheres and contribute to the circulation of alternative global master narratives.

Investigation into the meaning of Nigerian films and into their impact on Kinshasa’s public culture is thus situated in a global world where people and media images move jointly. With the flow of consumer goods, money, and bodies, media aesthetics also travels. The social trajectories of the film tapes and DVDs, the sources of the identity formation processes that are at stake, the dynamics of signification that these films provoke, and the legitimization and social control that the circulation of Nigerian films in Kinshasa induce are all properties of the framework of African media reception practices – which are themselves aspects of more encompassing economic and political flows. Of course, a South–South circulation of aesthetics is not a new phenomenon. What is new, however, is the revolution in communication and information technologies and its effect of reducing distance and of accelerating the flows. Indeed, the model of interconnectivity that is proposed by a globalization narrative represents only one phase in a global aesthetic system, in which for many centuries narratives and symbols have been circulating by means of imitation and of which the Nigerian film is only one example.¹⁴

Much research has documented the interaction between media and migration in Africa. On the basis of long-term participatory fieldwork, Minou Fuglesang (1994) and Brian Larkin (1997) have studied how Hindu films guide young people – Lamu in Kenya and Hausa in Nigeria – in the construction of their individual identities, direct their aspirations toward their future spouses, or fashion gender relations among them. This research furthers Stuart Hall’s encoding/decoding paradigm, which emphasizes the meaning-making of visual texts at its reception. In their attention to the social “effects” of the Hindu films, Fuglesang and Larkin demonstrate how the images, narratives, and even fictive characters resignify, at an abstract and imaginative level, the lives of the recipients and, more importantly, how these virtual realities are embodied in the young viewers’ lives. The mass media signs and codes introduce into the private and public spheres a transformation that, as the authors succinctly point out, is much awaited and longed for by the Lamu and the Hausa youth. In Kinshasa, Didier Gondola (1997, pp. 307–317) and Filip de Boeck (2004a, pp. 36–39) have studied how Hollywood westerns and Hindi movies shown in colonial Léopoldville (Kinshasa’s former name) shaped a colonial youth subculture that has received the name “Billism” – after Buffalo Bill and Pecos Bill, two protagonists in westerns. “Bills” or “Billies” imitated the clothing style and body language of American film heroes. They formed youth gangs endowed with their own hierarchy (e.g., “sheriffs”), initiation rituals, and language. These movements inspired a whole

street culture, called *le style des Yankees*, and the yankee figure occupies a prominent place in the city's complex construction of masculinities (see Pype, 2007). These findings show that much of the literature on media and migration remains at the levels of media reception, the production of minority media, and their impact on the production of identities in diasporic publics.

Yet there are still several aspects of the interactions between media and migration that need careful analysis and theoretical elaboration in light of recent reflections on cultural globalization – such as those of Arjun Appadurai (1996), Jonathan Friedman (1994), and Ulf Hannerz (1992). First, the study of migration and media should not be limited to the social contexts in which media products are watched and consumed; it should also take into account the circulation of print magazines, audiotapes, and DVDs in various communities. This is not only because distributors occupy particular nodes in the chains of production, but also because social groups, entrepreneurs, and other individuals often commission the production, acquisition, and distribution of prints and broadcasts. It is important to understand how the dissemination of images and sounds runs along flows of money and other forms of capital. Only when we reconstruct the “social biographies” (to use a concept from Kopytoff, 1986) of the visual media can we begin to understand how the media impinge on identities. To illustrate this idea, I will mention that the spread of Nigerian films in Kinshasa is not controlled by the Nigerian traders (about 4,000, mostly Igbo) who reside in the city. Kinois people themselves, who move to Nigeria, return with these films and offer them to local TV patrons, sell them to the music and video shops in town, or give them to *bashayeurs* to sell them in the streets. This means that the local circulation and reception of Nigerian films are embedded in the migration practices of Kinois themselves, and thus cannot be credited to the presence of Nigerians in the city or to the merits of their skilled traders.

Second, anthropologists also need to look at how these media products are framed within larger narratives and audiences. As argued by Katz and Liebes (1991), local considerations determine the interpretations of televised narratives and images. Nigerian films' recuperation and integration into the new media landscape, as a constitutive aspect of adaptation and globalization, was only possible because of political and cultural changes in Kinshasa. From what I have discussed, it appears that the success of the Nigerian films does not reside in the mere specialization of a so-called genuine African film industry that can “speak back” to the metropole and counter the cultural imperialism brought forward via film. It is more the establishment of an African Christianity that accounts for the popularity of Nigerian films among Kinshasa's spectators. Three categories of media brokers can be identified in this cultural circuit: the petty trader, the Christian pastor, and the dubber. It should be emphasized that these three categories are not strictly separated. Pastors also engage in petty trade, while traders also become dubbers; and dubbers at times also acquire the same charismatic capital as pastors (Pype, in press).

The arrival of Nigerian films in Kinshasa is largely shaped by a religious network, which acts above all to structure the product's meaning. Nigerian films are integrated

and taken up in a set of transformational units that orchestrate its reframing within the context of local meanings. Nigerian films are part of Pentecostalist evangelizing practices, and they are culturally assimilated by its brokers – and also by its spectators. We could well argue that, for the current Kinois context, the imported Nigerian films have become embedded objects of charismatic Christianity. Such insertion in local viewing cultures is informed by local cultures of authority and power, in particular, by the new position of authority of charismatic pastors. Most of these new Christian leaders have received their new power position both from the appeal of charismatic Christianity and from their proximity to Nigerian Christian culture.

A final aspect that needs to be discussed is the blending of transnational narratives and signs with local symbols and values. “Foreign” stories and plotlines are constantly interwoven with locally rooted characters and scenarios. In the field of media anthropology, the confrontation, rejection, and/or embracement of transnational narratives and characters in local storylines can offer an interesting vantage point for a fuller comprehension of the production of key scenarios. In the context of post-Mobutu television serials, it is important to identify traces of “ethnic narratives” that have become resignified through new values and belief systems, which have come to dominate the public culture.

For example, the traditional figure of MoniMambu from folklore and oral stories has become resignified through the theater troupes for teleserials. MoniMambu (whose name is Kikongo for “Seer of troubles”) is one of Kongo’s many trickster figures,¹⁵ known to Kinois primarily through their elders and artists (Janzen, 1992, p. 258). Nowadays MoniMambu can be found in new cultural performances, including a theater company called Moni-Mambu, which broadcasts its serials on the privately owned channel NzondoTV. A temporary theater company called LesMdu Congo produced a serial entitled *MoniMambu*, which starred some of Kinshasa’s most important actors. In addition, the names of some of the fictional characters in Cinarc’s serials resonate with the name MoniMambu: Mambweni (“The things that I have seen”) and Mayimona (“The things that one sees”). Although few of the young Cinarc actors or other young informants seemed to be aware of the specific cultural significance of characters such as MoniMambu, one finds common ground between the “traditional” narratives and the urban teleserials. Both genres visualize social and spiritual transgression. Of utmost interest here is that the Pentecostal popular culture, itself the outcome of globalization, has resignified the protagonists of local ethnic stories while maintaining their fundamental meanings (Pype, 2010).

Conclusion: TV Serials and Palimpsests of Culture

The anthropological turn toward “the production of culture” and “the broadcasting of culture” enables us to trace, through a diachronic and synchronic study of local TV fiction, the various power configurations that have shaped Kinshasa’s public

culture. It also helps us to explore the various kinds of social success and the most appropriate means to achieve it that have been represented in the space of TV fiction. “Key scenarios” and ideas of “culture” are not static; rather they change over time. The coming and going of “key scenarios” on local screens reflects and partakes in the political and social transformations that societies experience.

The anthropological perspective, which entails a constant move between content analysis and the social space in which these dominant narratives were/are produced, and also takes into account the appropriation of transnational signs and narratives and their confrontation with local values and protagonists, is extremely helpful in unraveling the various ways in which culture is produced. “Culture” is not something that “exists” beyond human beings. Rather, ideas about “culture” are produced, visualized, reflected upon, contested, watched at, enacted, and broadcast. And TV fiction does not stand outside this project of “making culture”; rather, as has been shown in the analysis of Congolese TV drama, media producers grant it a very central position within the imagination of selves, others, and society as a whole.

Given the different “foreign” influences that have shaped the design of the Congolese postcolonial teleserials, from Belgian colonial stimuli to Chinese film and Nigerian witchcraft films, it is questionable how far we can describe these visual texts as “local products.” Karin Barber (1997, pp. 358–359), reflecting on aesthetic genres and audiences in Africa, argues that the distinction between “local” and “imported” cultural forms becomes more and more dubious as a result of the hybrid nature of African cultures. The analysis has also shown that a society’s key symbols are configurations of local and transnational narratives, protagonists, and motives. The postcolonial “key scenarios” that have been promoted via Kinshasa’s TV screens have always been local products of “foreign” and Congolese/Zairian ideas and images, thus confirming that “cultures” are not closed systems; rather they continuously change, incorporating new signs and mixing them with more familiar themes. For an anthropologist, TV fiction is a palimpsestic space where the different layers of meaning-making and culture production can be explored.

NOTES

- 1 Askew (2002, p. 7) contends that it was not until the late 1980s, in the wake of the “crisis of representation” in the discipline, that the uses of technology in ethnographic research have begun to be questioned.
- 2 See Mead and Métraux (2000) for a discussion about the research motivations, methodologies, and publications of the project.
- 3 This overview is limited to the audiovisual media. The printed press constitutes another important sector of Congo’s media landscape, with its own political imagination. Furthermore, other Congolese cities have, of course, their own local media history.
- 4 The *évolués* were a category created and set apart by colonial officers among the indigenous population. They received Western schooling, lived according to Western housing

styles, accepted Christian faith and its codes of conduct, and were employed in the colonial economy. In his public and private life, an *évolué* had to display assimilation with Western style and values, with “civilization,” while “tradition” had to be abandoned. The ideal colonial subject was thus a converted, educated, and working man, an African bourgeois character. This category has a long and complex history. On the education of the *évolué* in Kinshasa, see Tshimanga (2001, pp. 133–146).

- 5 The following overview is largely based on a series of interviews with Hemediy Mwana Mboyo and Gabriel Pasi Samba, former program directors of the Zairian state television, and with Ndungi Mambimbi (screen name “Massumu Debrinder”), Kwedi Mayimputu (“Kwedi,” “Diallo”) and Mathieu Matondo (“Sans Soucis”), all important dramatic artists since the early years of Kinshasa’s television serials.
- 6 A historical ethnography of the reception of these plays is needed in order to nuance present-day dismissals of these programs as meaningless.
- 7 There were 111,811 television sets for about 3,000,000 inhabitants in 1975 (Otten, 1984, p. 69). Informants told me that people would watch in their neighbours’ houses if they did not own a TV set.
- 8 Ndaywel è Nziem (1998, p. 484) mentions that these lyrics had become very popular in the earliest urban music produced in Kinshasa in the 1950s.
- 9 I was unable to retrace the exact title of the documentary. According to Mwana Mboyo and Pasi Samba (2004), the Chinese word *yukung* means “collective work.” The content of the film, as they summarized it, recalls a well-known allegorical tale of “traditional China” used in Maoist propaganda. The tale “Old Fool Moves Mountains” was Mao’s preferred fable and occurred in his “Little Red Book,” officially known as *Quotations of Chairman Mao Zedong*. This book explained Mao’s ideology and was distributed among the Chinese population during the cultural revolution (1966–1976). Convents’ account (which is based on Otten, 1984) of the origins of the serial *The Spirit of Salongo* is somewhat different. He writes that Mobutu had visited a Chinese village called Yu Kong. “In order to build the village, the inhabitants had to move mountains. The Chinese film *How Yu Kong Moved a Mountain* narrates this event” (Convents, 2006, p. 298; my translation).
- 10 See Malu and DRIM (2004).
- 11 Also called *Nollywood*, although I have never heard this name used in Kinshasa.
- 12 The main languages in Kinshasa are Lingala, Kikongo, and, to a lesser extent, French.
- 13 A compound refers to a plot of land on which one or more houses are built. Usually, within one compound three to four families cohabit, each of them living in one house. The number of people living in one compound can reach up to 40.
- 14 One can think of the circulation of the water spirit Mami Wata as another example (Drewal, 2008).
- 15 Kongo refers here to the ethnic group of the Bakongo, who live in the province Lower Congo.

Why Has News Production in the United States Remained Stable at a Time of Great Change?

David Michael Ryfe

ABSTRACT

This chapter canvases the literature in the sociology of news production for explanations as to why, in the face of great change around them, American newspapers have failed to innovate. It finds three sorts of explanations in this literature: journalists are anchored to habits; they have deep investments in traditional practices and values; and they routinely re-enact long-standing definitions of what journalism is and of what it is for. Each explanation is elucidated through examples taken from the author's recent ethnographic work in several newsrooms.

According to many observers, journalism in the United States is undergoing a profound transformation. The argument rests principally on the new possibilities for cultural production brought on by the Internet. The Internet opens the doors into the field of journalism to many new entrants, thereby displacing journalists from their traditional role as gatekeepers of public conversation. As a multimedia networked medium, for example, the Internet creates the possibility of nonlinear – in other words non-authorial – storytelling (Pavlik, 2001). It allows “people formerly known as the audience” to produce their own news (Gillmor, 2004). It gives political

actors an opportunity to reach their constituencies without the mediation of journalists (Bimber, 2003). It changes the way in which knowledge in public life is produced, aggregated, and brought to bear on governmental policymaking (Noveck, 2009). And it transforms the business model of journalism, which hinges on journalism's ability to serve as a funnel between advertisers and consumers (Anderson, 2009; Jarvis, 2009; Tapscott & Williams, 2006). The upshot is that the Internet has ushered in an age of "mass amateurization," as Clay Shirky (2008, p. 71) puts it, a time when "anyone can be publisher [. . .] [ergo] anyone can be a journalist."

Yet, despite this great upheaval, most descriptions of the practice of news-gathering and reporting find that it is stubbornly unchanged. Journalists still rely on the same sources, especially government agencies, as principal sources of news (see content analyses by Chung, 2007; Paterson, 2007; Quandt, 2008). Their definitions of news and newsworthiness, for instance through immediacy, impact, uniqueness, human interest, and the like – which have been taught in introduction to journalism classes for decades – remain essentially in place (see Leetaru, 2009). Conceptions of the journalist's role still revolve around long-standing values like objectivity, factuality, balance, and neutrality (see O'Sullivan & Heinonen, 2008; Paterson & Domingo, 2008). This is true even for "citizen journalists," who see themselves and their work mostly in traditional terms (see Ryfe & Mensing, 2010). The presentation of news is changing a bit more. News-writing today is more informal and conversational than in the past, and more likely to incorporate multimedia elements. But these are changes of style rather than of substance. Despite the challenges posed by the Internet, the evidence indicates that journalists continue to act as if they were gatekeepers of the public conversation.

We are presented, then, with a puzzle. Why, when the challenge to journalism is so great, does the practice of news production in the US remain comparatively stable – even among individuals and groups located outside of mainstream news organizations, and indeed outside of the profession?¹

In what follows I entertain three explanations of this puzzle, from the perspective of the *sociology of news* production. Each of these explanations highlights the role of news practices, but it perceives these practices as doing different sorts of work. The first explanation views news practices as something akin to habits. Journalists have been socialized to adopt particular practices and to perceive them as natural and inevitable. The unreflective manner in which journalists approach news practices, this argument goes, makes them difficult to dislodge. A second perspective notes that practices are not simply rules that journalists habitually follow. Rather, they are more like institutions – practices that contain both rules *and* resources (e.g., money or status). It is possible for journalists to develop investments in news practices, regarded as resource-laden activities. This means that change may be inhibited not because journalists are unreflective, but because they make strategic calculations about the costs and benefits of reordering these investments. Finally, a third approach observes that news practices are constitutive, in the sense that they enact a basic definition of what journalism is (see Ryfe, 2006). This definition acts as a kind of gravitational force, pulling journalists and others to engage one another in traditional ways, and

setting boundaries beyond which it becomes difficult to recognize activities as journalism. To the extent that journalistic practice enacts constitutive rules, this argument suggests, old practices will tend to persist and new practices will tend to reproduce old meanings.

These explanations roughly correspond to three “waves” of research (Cottle, 2009) in the sociology of news tradition. The earliest, largest, and most powerful wave occurred in the decade from 1970 to 1980, when, by my count, no fewer than 15 studies written by 21 scholars were published (see, in chronological order, Tunstall, 1971; Cohen & Young, 1973; Sigal, 1973; Sigelman, 1973; Epstein, 1973; Argyris, 1974; Roshco, 1975; Altheide & Rasmussen, 1976; Chibnall, 1977; Tuchman, 1978; Schlesinger, 1978; Gans, 1979; Golding & Elliott, 1979; Fishman, 1980; Bantz, McCorkle, & Baade, 1980). This literature, which focused mostly on Anglo-American news media, came to a remarkably uniform conclusion about news production: news was homogeneous across news outlets, in large part because it was strongly shaped by organizational habits, routines, norms, and values adopted in much the same way by almost every news organization. By the early 1980s, this emphasis on the power of professional routines was conventional wisdom among those who studied the news. A second wave of research, smaller and less powerful than the first, arose to challenge this view (see Cottle, 2003; Eliasoph, 1988; Jacobs, 1996; Pedelty, 1995). In this wave, scholars stressed the themes of variability, heterogeneity, contingency, and conflict in the production of news. They argued, with Ronald Jacobs (1996, p. 375), that, while professional routines ensured a degree of uniformity in the news, “both within and between news [. . .] organizations, there is a significant degree of contestation and heterogeneity.” Beyond contradicting conventional wisdom, however, this wave of research developed no compelling alternative theory of news production, until Timothy Cook (1998) and Bartholomew Sparrow (1999) introduced an institutional theory of news in the late 1990s. This theory accounts for the interplay of uniformity and variability in news production through appeal to a language of interests, investments, strategies, and calculations. Finally, a last, incipient third wave of research is, I must admit, really one of my own making. I take my cue from recent work in the sociology of culture on “anchoring practices” in cultural production (see Archer, 1996; Emirbayer, 1997; Emirbayer & Mische, 1998; Joas, 1993; Swidler, 2006). On this view, culture may work not by forming habits or prompting investments, but by defining what things, at bottom, *are* in social interactions. I say more about this notion below, but I believe the intuition explains a curious fact: practices may persist even when the individuals participating in them expressly desire to change.

It is tempting to frame these waves of research in terms of a story of progress, each wave improving on the last. But this would be a mistake. The history of the sociology of news has been less one of progress than one of addition. Each wave has added new concepts and ways of thinking that allow scholars to grapple with new situations and to address new questions. When it comes to the question of change, or rather of the lack of change, each tradition offers an important perspective, and indeed in most newsrooms the dynamics they refer to probably compound one another.

It is also the case, I think, that these traditions are not equally valuable at every moment. The first two explanations describe journalists as resisting, in various ways, the transformation of their profession. My own investigations of American metropolitan daily newspapers, which began in 2004, indicate that this resistance was more apparent in earlier stages of the transformation. Until about 2005 journalism remained a relatively settled profession, and many journalists acted as if the Internet was merely a hindrance to their practice. In contrast, today almost every working journalist recognizes that the Internet has dramatically altered the landscape of news, and that the profession must change in response to its new environment. I meet very few journalists these days who simply resist the idea of change. Yet, despite this growing awareness, news production remains as stable as ever. The constitutive quality of news practices better captures this fact: that news production remains unchanged even against the expressed wishes of journalists. My broad point here is that the transformation of news is a moving target. This means, in part, that the acuity of the lenses necessarily varies with changes in circumstances.

In what follows I outline the three approaches, drawing, where appropriate, on the relevant theoretical and empirical literature. Throughout I illustrate each perspective with examples from my own ethnographic investigations.² Taken together, these perspectives explain why, in the midst of great turmoil, news production in the US remains remarkably stable.

Habits

The first of the approaches is the most long-standing and the easiest one to explain. It was deployed first by the early wave of newsroom ethnographies conducted in the 1960s and 1970s. To a person, the researchers who conducted these studies were struck by the highly routine and bureaucratic nature of news production. Here is Mark Fishman (1980, p. 14): “the routine work methods of journalists are capable of explaining the distinct character of media news.” And Phillip Schlesinger (1978, p. 106): “Broadcast news is the outcome of standardized production routines [. . .].” And Leon Sigal (1973, p. 4): newsmaking and gathering “is routine behavior: a good deal of the news is a product of the coupling of two information processing machines: one, the news organization; the other, government.” And Edward Epstein (1973, p. 8): “the outputs of network news are not simply the arbitrary choices of a few men; they result from a process.” The news, in short, is an outcome of bureaucratic rules, or, as so many of these studies put it, it is “manufactured” according to standard routines.

The language of routine implies that news practices are akin to habits: unconscious, unreflective, and utterly naturalized recipes for action. This is certainly the sense conveyed by the early studies. Leon Sigal (1973, p. 101) reports that news routines “take on a life of their own [. . .] Learned during apprenticeship, reinforced in daily experience on the job, they become ‘the way things are done.’” Gaye Tuchman

(1978, p. 186) argues that reporters adopt a “natural attitude” toward their work, relying on largely implicit, everyday understandings to guide their activities. Herbert Gans (1979, p. 82) likens news decisions to “quick intuitive judgments, which some ascribe to a ‘feel.’” Throughout, these studies portray journalists as unselfconsciously reproducing the routines embedded in their practices.

The key dynamic in this process of news-gathering is socialization. Journalists, the argument goes, learn habits through immersion in newsrooms. Warren Breed’s (1955, p. 328) analysis of how newspaper policy is conveyed to journalists is a classic statement of this position. He finds that each journalist learns his/her jobs as if “by osmosis [. . .] [staffers] become socialized and ‘learn the ropes’ [. . .] [by] [. . .] discover[ing] and internaliz[ing] the rights and obligations of his status and its norms and values.” Others have found much the same thing. Lee Sigelman (1973, p. 137) observes that reporters learn how to produce news in a “highly diffuse and extremely informal” manner, mostly by observing more veteran reporters as they go about their business. John Johnstone (1976) describes more formal mechanisms, like the role of the assignment editor in socializing reporters. Some of this socialization, of course, takes place outside the newsroom – in journalism school, for instance. But most journalists “learn the ropes” of the profession by working in the newsroom.

As an example, during my research I worked for six months in 2006 as a novice at a newspaper. Because I was a novice – and everyone in the newsroom knew it – the city editor often led me through a series of steps for completing a story: go to this place; ask to speak to this person; ask these questions; get these documents; call me with what you find – and so on. Reporting on each of these stories followed a script, and after long experience my editor could recite each script by heart. On one occasion, I returned to the newsroom to write a typical 10-inch story on a press conference at which the local district attorney announced a big drug bust. I sat at my computer, struggling to decide how to frame the information I had gathered. Counting on this story for the next day’s newspaper and sensing my difficulty, my editor walked over and asked how things were going. After explaining my dilemma, he told me that there were really only seven different stories I could write about any drug bust. My job was to figure out which of these formulas applied best to the information at hand. At the end of my six-month stint I was socialized into the newsroom well enough not to have any longer to vocalize, or even think about, many of the steps necessary for gathering and reporting the news. Like my editor, I had begun to take them for granted, understanding them as the natural and appropriate things to do in the performance of my job.

The taken-for-grantedness of news practices is important to our story because, as the saying goes, habits are hard to break. This is so for two reasons. In the first instance, their very implicitness makes them difficult to uproot. Even today, after so much of conventional wisdom about journalism has been dispelled, many reporters describe standard news routines as simply the “way that news is produced.” This “natural attitude” prevents them from considering how they might respond in new ways to the new environment that surrounds their profession. In the second instance,

breaking old habits requires time, attention, and reflection – scarce commodities in the contemporary newsroom. Time and again, journalists have told me they wished they had the luxury of thinking during the course of their day. But they simply do not have the time. Every day they must get the newspaper out; and, to accomplish this feat, they must rely on standard routines. In recent years the task has only become more difficult, as journalists have been forced to do less with more, that is, to fill not only newspapers but websites, blogs, twitter feeds, and the like – and all this happened with fewer of them in the newsroom. On several occasions, reporters have used the same metaphor to describe the difficulty. It is, they have told me, like building an airplane while it is in flight.

One explanation, then, for the persistence of standard practices in the midst of transformation has to do with the way in which journalists are socialized to follow tacit rules of news production. In criticisms of journalism, this idea is most often packaged as an indictment of the organizational culture of newsrooms. In a confidential email, one journalist told me: “Our challenge is [that] we can’t break free of the cultural shackles and move the proverbial ship fast enough.” Paraphrasing another journalist, Peter Preston (2008, p. 318) presents the problem thus: journalists “treat every change, every innovation, with suspicion and something akin to fear.” Stuck in their routines and in their received wisdom, journalists simply are unwilling to change, or cannot change fast enough to match the speed of the transformation underway in their profession. In the academic literature, the criticism is often framed as a “cultural clash” between old and new journalists (Hermida & Thurman, 2008). To the extent that “old” journalists remain mired in old habits, their unwillingness or inability to change has prevented the profession from becoming more innovative (see also Bardoel & Deuze, 2001).

This argument is intuitively sensible, and it is visible in newsrooms. In the three newsrooms I have visited, I have met experienced journalists who are set in their ways; they refuse to carry cameras and take photos (as the new, multitasking, mobile journalist does); they make their editors add the graphics, boxes, and sidebars that accompany their stories; they fail to respond to readers’ comments online; they are adamantly opposed to blogging and, if given a blog, they refuse to post to it. A typical example of this “natural attitude” happened during a meeting at one of the newsrooms I visited. The editor formed a committee of veteran journalists to work on a proposal for how newsroom practices might change in response to a perceived need for the newsroom to become more multiplatform – specifically, web-focused. The committee’s recommendations were to be circulated throughout the newsroom. At their first meeting, committee members launched into a harangue about all that is wrong with the web: it destroys good writing; it takes reporters off the street; it is a “black hole” that sucks time and does not generate quality content. Said one member: “We have forgotten that we are the only news-gathering operation in this city. We are trying to be radio [. . .] the web. Let’s be the newspaper.” Ironically, though not surprisingly, at the end of several meetings the committee recommended that the newsroom reallocate resources back to the newspaper.

The sentiment “let’s be the newspaper” is a nice illustration of how the “natural attitude” of traditional reporters can inhibit change. But a focus on the taken-for-grantedness of traditional newsroom culture has limitations. Most obviously, as a second wave of research has argued, it leaves little room for journalistic agency – that is, for the possibility that journalists may actively interpret their routines rather than reproduce them as if by rote (Cottle, 2003; Eliasoph, 1988; Jacobs, 1996; Pedelty, 1995). Charles Bantz (1985), for example, observes that journalists do not always agree with news routines, or enact them in any simple way. Rather, reporters engage in constant conflict and negotiation with one another and with their managers. Nina Eliasoph (1988, p. 315) asserts that routines “accomplish different things in different contexts.” And Mark Pedelty (1995, p. 7) shows that news production looks less like a monotonous return of the same than like an endless management of contradiction.

A focus on habits has little to say about these variations in routines, or about the role of conflict in the reproduction of standard practices. Moreover, it does not explain why individuals working outside of mainstream newsrooms, such as online journalists, and even outside the profession, like citizen journalists, often seem as intent on reproducing old practices as the traditional journalists. Nor does this focus account for the fact that, after several years of dramatic upheaval, during which many unthinkable events have happened, there is little that is taken for granted in newsrooms today. Thus, while it is true that much of news production is indeed routine and is practiced in an unreflective manner, this insight cannot fully explain the stability of news production as a general rule, let alone during a time of great transformation.

Investments

If the second wave of research successfully pointed out that journalists produce the news in significantly different ways across news outlets, it did less well in crafting a theory that made sense of this variation or explained how and why it coexisted with the routines observed by the first wave of studies. Such a theory began to emerge, ironically enough, in a body of work intent on explaining the homogeneity of news production. Researchers began to note that, while first-wave scholars successfully highlighted the importance of news routines, they did less well in explaining the origins of these routines. As Simon Cottle (2003, p. 17) observes, most of this literature applies a kind of “organizational functionalism” to this question: the genesis of every routine is found in a perceived need on the part of news organizations. It is easy to identify the basic flaw in this explanation. If routines arise in order to satisfy organizational needs, and different organizations have different needs, then one would expect different organizations to adopt different routines. Empirically, this is not the case. Instead, as Timothy Cook (1998, p. 64) notes, every daily news outlet

seems to be organized in much the same way and to abide by the same routines. To explain this uniformity, a number of scholars have turned to institutional and field theories of society (see Benson 2004, 2006; Benson & Neveu, 2005; Cook, 1998; Ryfe, 2006; Sparrow, 1999). On their account, news routines arise less from organizational need than from historical and institutional circumstance. Take, for example, the practice of deploying journalists at government agencies. This practice originated in the late nineteenth century. At the time, the practice was adopted in order to satisfy an organizational need, namely the need to get timely information. However, once adopted, the practice was propelled forward by the dynamics of path dependence. As explained by Paul Pierson (2000, p. 252), path dependence means that, as social actors take steps down a particular path, “the relative benefits” of continuing down the path “compared with other possible options increase over time.” The choice of placing reporters at government agencies set an important precedent. Over time, the cost of adopting and maintaining this practice gradually lowered in relation to the benefits of reproducing it, and so the practice eventually took hold across the field of journalism.

The crucial insight of this approach is that news routines are not simply sets of abstract rules that journalists learn. Rather they are constellations, to borrow from Anthony Giddens (1979, pp. 62–64), of “rules *and* resources” (*italics mine*). Again, consider the practice of stationing reporters at government agencies. It is true that the practice of “covering a beat” consists of abstract schemata or rules. Every reporter knows that covering a beat requires periodic chats with public information officers, attendance at agency meetings, collection and review of publicly available documents, and so on. But the practice only becomes effective when it accrues material and symbolic resources. Material resources include such things as office space, rolodexes, websites, and staff dedicated to answering reporters’ questions. Symbolic resources include such things as friendship between agency staff and reporters, role conceptions, know-how, status, and recognition. Over time, these kinds of resources pooled around the practice of covering beats, such that the two – rules and resources – tended to implicate and reproduce each other. William Sewell (1992, p. 13) makes this general point when he writes: “schemas [or rules] are the effects of resources, just as resources are the effects of schemas [rules].” Applied to the practice of beat coverage, this means that the rules governing the practice naturally reproduce resources, just as the accumulation of resources around these practices tends to reproduce the rules. This dynamic makes the structure of news production difficult to circumvent.

A concrete example will illustrate the point. During my visit to one newsroom, reporters and editors were making a substantial effort to upgrade content on the newspaper’s website. In the past, the website had received scant attention. One or two individuals were responsible for posting content, and most of the content they posted was repackaged from the newspaper. Moving forward, the site was to receive new attention and resources. As they tracked traffic on the site, editors learned that their largest audience visited at 8 a.m., then in slightly smaller numbers at noon and

at 5 p.m., at which time traffic essentially disappeared until the next morning. These data led them to focus their efforts on posting as much fresh content as possible at 8 a.m. A problem arose, however, when editors realized that almost every reporter was assigned to a specific beat, that most of these beats covered government agencies, and that government agencies offered little new information between the hours of 5 p.m. and 8 a.m. For decades, the newspaper had invested resources in these beats, in forms as varied as interpersonal relationships, rolodexes, office space, and really simple syndication (RSS) feeds. These resources made changing the beat structure of reporting a costly proposition. It might have meant, for instance, dedicating more staff specifically to the website (and less to manning government beats), or requiring reporters to hold content for the web, or training reporters to do entirely different things, like interact with their audiences rather than with government sources. These costs might even have included not producing enough content to fill the next day's newspaper. Given that the newspaper still brought in over 90% of the organization's revenue and the website less than 5%, this was an easy calculation for the editors to make: they would innovate up to the point at which the cost of change outweighed the benefits of the status quo. In this case, the editors assigned two reporters to the website and asked them to start work at 5 a.m. But they made no other changes to the beat structure that governed most production in the newsroom, or to the way in which reporters covered beats. Thus conventional news practices persisted because the cost of inventing new ones was much higher than the benefits obtainable from their reproduction.

Individual journalists make the same sorts of calculations, and for much the same reasons. Unlike the first wave approach, which describes reporters as learning news rules and, once they have learned them, following them as if by rote, this second wave perspective portrays journalists as strategic calculators of self-interest. In other words, the schemata that organize social action confront journalists less as rules than as strategies for action. As a general matter, this change in language is designed to avoid the conclusion that social actors (like journalists) merely follow rules as if by rote. "In order to escape this danger," Pierre Bourdieu (1986, p. 111) says in an interview, "one needs to bring into the theory the real principle of strategies, that is, a practical sense of things [. . .] what athletes call a feel for the game." In the context of news production, this means understanding the schemata that organize practices less as sets of rules to be followed than as resources for problem solving.

In this way a theory that began with an effort to explain uniformity opens a way to understand the nature of variability in news production. It becomes apparent that, if viewed as problem-solving resources, multiple solutions to the same problem exist, in other words that journalists may arrange, order, mix, or combine the rules of news production in diverse ways. Consider again my six-month stint as a cub reporter. By the end of that time, it is true that I had been socialized into the newsroom well enough not to have to vocalize the rules any longer. But this is not to say that I always reproduced the practices in an unreflective, unconscious way. As a routine matter, this was not possible. Sometimes it was difficult to know which steps were the most

appropriate ones in a given situation: should I call this or that person, ask these or those questions? At other times I disagreed with the city editor about the newsworthiness of a story, and I had to invent a strategy to persuade him that I was right. And sometimes, in pursuing a story, I hit a roadblock and did not know how to go on. On these occasions I sought advice from others, retraced my steps, and pursued alternative paths. Throughout, I actively interpreted the rules of practice so as to solve the problem at hand.

This activity illuminates the performative and improvisational dimension of news production. Different journalists may apply different practices to the same situation, and the same journalist may apply different practices to the same situation at different times – just as the second wave of ethnographic work insists. Strategies of action are not so extensive as to account for the particulars of every situation. They are not so cohesive that it is impossible to combine them in different ways. People also are differently positioned vis-à-vis one another and vis-à-vis the situation at hand. What looks appropriate to do from one vantage point may seem inappropriate from another. Finally, people have in their possession many different strategies, any number of which may be brought to bear on a given situation. Practices, then, do not determine precisely how they will be practiced. As Alan Warde (2005, p. 134) writes of the practice of consumption, a “pattern of activity can be filled out by a multitude of single and often unique actions reproducing the practice [. . .].”

The language of strategy also illuminates the fact that rules present opportunities as well as constraints to social actors. Journalists who are more creative and more skilled at using these opportunities (manipulating available strategies) will naturally accumulate more resources (e.g., money, status, autonomy) in relation to other journalists. This means that the practice of news production is not only improvisational; it is also, by definition, political. As journalists adapt news rules to local circumstances, a pecking order develops. A few journalists become “stars” and accumulate great resources, which they may then leverage into new opportunities. Others obtain fewer resources and have more limited options. The same dynamic, by the way, applies to news organizations: Different organizations will accrue differential amounts of resources available in the field of journalism, and so they will find themselves placed in a pecking order as well.

This becomes important for the prospects of change because, as with news organizations, the resources that journalists accumulate as they adopt conventional practices represent *investments* in the status quo. Consider the case of Dan Manning, a veteran reporter who worked the health beat at a newspaper I visited in the summer of 2008. Manning was in his early forties and had spent the last two decades working his way up the pecking order of news organizations. He started out at a very small community newspaper and, after stops at four other papers, he finally landed a job at the biggest newspaper in the region, covering healthcare – a premier beat in the newsroom. From Manning’s perspective, the time, energy, and focus it took to master the practice of journalism represent an investment that he is, quite understandably, reluctant to relinquish. When contemplating changes to his practice, like blogging

or multimedia storytelling, his instinct is to protect and defend. As he told me in a conversation: “We need to preserve the core mission of the newsroom. If we don’t do anything else we need to do that [because] if we’re not doing that [then] what are we doing?” In other words, Manning wished to protect the practices in which he had invested so much of his professional life. His conservative posture toward change arose not from a mindless embrace of tradition, but from a strategic calculation.

A view of news practices as rules and resources adds essential pieces to our puzzle as to why news production has remained stable in a time of great change. Most importantly, this view restores a sense of history and a concern for agency that are lost in a strict focus on organizational habits. However, like the first wave emphasis on habits, the conception of news practices as strategic investments has limits. Since 2007, the once slow and gradual decline of newspapers has greatly accelerated. Revenues have fallen precipitously, layoffs have accelerated – nearly a quarter of daily journalists lost their jobs in 2008–2009 alone – and entire news organizations, like the Rocky Mountain News, have folded. As Doug Smith, director of the Punch Sulzberger News Media Executive Leadership Program at Columbia University, recently put it: “It’s chaos out there, and there’s definitely a sense of terror” (Folkenflik, 2009). This collective “terror” implies that the costs of maintaining the status quo have, in recent years, grown greatly in relation to the benefits. Yet, even today, I know of no initiative in a daily newsroom to change fundamentally the standard practices of news production. This suggests that something beyond investments, path dependence, and strategic calculation is at work in maintaining the status quo.

Definitions

In order to explain the persistence of conventional news practices, I have found myself searching for new tools. I have mostly discovered these tools in recent work in the sociology of culture; but I begin with Clifford Geertz’s (1973) famous distinction between culture as “models of” and “models for.” Cultural practices like the routines of journalism are “models for” in the sense that they serve as instructions for how to do the job. They are the rules that journalists follow to produce the news. But, as “models of” journalism, news routines also enact constitutive rules for what counts as journalism. The notion of a “constitutive rule” comes from John Searle (1969), who argues that practices like marriage, a trial, or indeed journalism have, embedded in them, rules that take the form “X counts as Y in context C” (quoted in D’Andrade 1984, p. 91). Such rules bring into being the very reality they name, and they do so by determining what counts as what in their particular social domain (for an application to journalism, see Ryfe, 2006).

Take, for instance, a reporter’s notebook. We can think of the notebook as a resource attached to the practice of gathering information. Of course, there are rules for performing this activity: what kinds of information to collect, in what form, and

so on. In this sense, the notebook has, embedded in it, a “model for” doing journalism, a recipe for how to perform the activity. However, the notebook also contains a “model of” journalism. It presupposes, for example, that a journalist is someone who gathers information (hence the need for a notebook). It assumes that a journalist must collect information from a source (most often, someone who possesses newsworthy information) and deliver it to a consumer (someone who might find the information useful, but would not learn of it without the efforts of the journalist). In this sense, the reporter’s notebook enacts a definition of what journalism is: it is the act of filtering information obtained from one group and disseminated to another (or, in conventional terms, it is the action of a gatekeeper of information).³ This constitutive rule serves as a background context, which lends meaning to the reporter’s notebook. To feel this rule at work, simply attend a city council meeting with and without a reporter’s notebook and compare the difference in the way others respond to your presence.

The question is: What makes constitutive rules (like the notion of journalism as a filter) so resilient? Traditionally, the answer to this question has been something that comes down to the idea that constitutive rules are embedded habits. One strain of this argument suggests that habits run very deep. Built up through a process of accretion, such rules serve as an inner core for social fields, a background that creates the possibility of action. As such, the rules may simply be so implicit that they lie out of the reach of social actors like journalists and cannot be changed by them. Another strain has it that the habits are broadly apparent. Perhaps rules like “journalism is a filter” remain vital because they inform a great variety of news practices. The very number and breadth of these practices make the rules resilient. These arguments contain a kernel of truth, which is why the first wave of research in the sociology of news remains vital. It notes that the rules constituting journalism may be so tacit and difficult to formulate that they are beyond the reach of explicit efforts to change them. And it observes that the rules are embedded in so many practices that inertia sets in even if technological change alters some of them.

While sensible and certainly capable of explaining some of the dynamics of transformation in journalism, these arguments do not, however, capture all of the evidence. For instance, journalists have attacked and defended the conception of journalism as a filter of public information, an indication that the rule is not beyond their ability to formulate it in explicit terms. Moreover, the argument for breadth fails to explain why, in many cases, journalists are using new technologies less in order to invent new practices than in order to sustain old ones. From this perspective, it is especially puzzling that non-journalists, like bloggers and citizen journalists – who have not been socialized into the conventional practices of news-gathering and reporting and therefore have no investment in these practices – have used the new technologies more to reinforce than to challenge the standard conception of journalism (Ryfe & Mensing, 2010).

As a way around these dilemmas, I turn to sociologists, who note that the immediate experience of actors in a social situation is with one another, not with abstract

rules or structures (see Archer, 1996; Emirbayer, 1997; Emirbayer & Mische, 1998; Joas, 1993). On the ground, actors do not experience social structures so much as they experience *interpretations* of those structures (Wiley, 1994). This insight leads Ann Swidler (2006, p. 85) to argue that practices anchor constitutive rules in a social domain by serving as an “infrastructure of repeated interactional patterns. [Constitutive rules] remain stable not only because habit ingrains standard ways of doing things, but because the need to engage one another forces people to return to common structures.” In other words, constitutive rules persist not (or not only) because they are deeply and broadly embedded, but because they coordinate routine interactions between social actors. So long as the practices are followed, the interactions persist, and therefore so do the constitutive rules guiding those interactions. This result will follow even when the rules are no longer deeply or widely embedded.

Consider the following example. At the *Cedar Rapids Gazette* – one of the newsrooms I have visited – the CEO of the company, Chuck Peters, has led reporters through several presentations that describe a revolution in journalism.⁴ Peters argues that, in an online environment, journalism must and will become interactive, transparent, and collaborative. No longer a primary gatekeeper to public conversation, journalism must reinvent itself as a facilitator of and catalyst for community interaction. By this he means that journalists must come to see themselves as one voice among others in a community conversation. Over the past year, Peters’ ideas have sparked an entire reorganization of the newsroom. The discussions about change in this newsroom have been so incessant that one group of reporters has made the topic into a drinking game: during meetings, they take a drink of water every time someone uses the word “fundamental” to describe the impending changes.

But, while *Gazette* reporters and editors have become comfortable talking about and imagining a new journalism, they are much less able to imagine *doing* journalism differently. Charlie Adams is a nice illustration of this point. Adams, who is in his mid-twenties, started as an intern at the *Gazette* three years ago and today is a city politics reporter. In a conversation, Adams expressed a willingness to change his practices. He likes blogging and is active on Twitter. When I asked about Peters’ idea of a journalism that is more collaborative and interactive, Adams did not flinch. He expressed support for it and said, in agreement with Peters, that something like this kind of journalism was inevitable. In fact, when I entered the newsroom, the editor of the newspaper, Steve Buttry, held up Adams as someone who “gets it” and is readily adopting the new mind-set.

Despite his expressed interest in change, however, Adams finds himself doing journalism mostly in conventional ways. In large part, this is so because the filtering conception of the practice lies at the heart of his daily interactions with others. On his beat, almost every day, Adams does the following operations: he scans the meeting agendas of various government institutions; he interacts via email with individuals in and around government who might have newsworthy information; he contacts officials and experts to obtain quotes and to verify facts he would like to include in

his stories; and, when time permits, he attends government meetings. In each of these interactions, Adams and his sources act on the assumption that he is a filter (or gatekeeper) into the newspaper, and therefore into the public conversation. This assumption informs everything, from Adam's skeptical attitude to the types of question he asks, to the snap judgments he makes about the information conveyed by sources. In other words, throughout these interactions, Adams' posture toward others is imbued with the filtering conception of journalism. This conception also informs the attitudes and actions of his sources, who work hard to manage how their information and views are portrayed in his stories. Adams' interactions in the newsrooms also reproduce the status quo. Every day his editors ask Adams to vouch for his work, to show, for example, that he has asked the right people the right sorts of questions, that he has verified information and correctly quoted sources, and that, most importantly, he has gotten his stories done on deadline. Thus, even as Adam grows more comfortable talking about change, his interactions with others ritually enact a traditional constitutive rule of journalism.

From this perspective, the principal impediment to change lies not in what journalists believe, prefer, or say, but in what they do. Their daily practices place them in relationships with others that, like a gravitational force, push and pull them to reproduce the established reality of what journalism is. Put another way, the key inhibition to change is not socialization, as in the first approach, or strategic calculation, as in the second, but recognition: the ability of journalists, sources, and even consumers of news to recognize new practices as journalism (and various individuals as journalists when they engage in these practices). Take, for instance, the practice of blogging. It is one of the most common new practices in journalism. Yet, in my conversations with journalists, most have described blogging as something that their editor has asked them to do in addition to their journalism. Typical is the comment of this reporter: "I don't mind blogging, but sometimes it gets in the way of my work." Here the impediment to adopting the new practice is not normative – "we shouldn't do X" – or epistemological – "I don't know how to do X" – but ontological: "why would I do X?" This journalist did not resist blogging so much as fail to recognize it as a form of journalism. Given this fact, is it any wonder that reporters commonly use blogs as opportunities to empty their notebooks of the stories that, for reasons of space, they can no longer get in the newspaper?

The importance of recognition also helps to explain why online journalists and non-journalists often reinforce the values of traditional journalism. In newsrooms, online journalists must interact with others in terms of the filtering conception, or they risk being perceived as non-journalists (Paterson & Domingo, 2008). To establish their credibility, bloggers often work harder to hold journalists accountable to conventional practices than to invent new ones (Graves, 2007; Lenhart & Fox, 2006; Reese, Rutigliano, Hyun, & Jeon, 2007; Tremayne, 2007). And citizen journalists often act more out of a fear of losing traditional journalism than out of a desire to innovate (Ryfe & Mensing, 2010). In each instance, new entrants into the journalistic field are pulled toward conventional meanings via a process of recognition: individu-

als tend to orient their energies around practices that can be readily recognized and justified to others, in social interaction, as journalism.

Conclusion

It has been 15 years since the Internet first made its way into newsrooms, and it has been 10 years since observers recognized the medium's potential to disrupt conventional news practices. Yet, today, news production remains relatively untouched by this disruptive force. This fact represents one of the most compelling puzzles facing sociologists of news today. The solution to this puzzle illuminates crucial dynamics within journalism. Since journalism is one kind of cultural production among others, perhaps the solution has insights for the study of media production more generally.

In this chapter I have reviewed three potential explanations. All three focus on news practices, but they frame them in different ways. According to a first approach, news practices are habits: tacit rules that journalists have been socialized to reproduce in a relatively unreflective, unconscious way. On this view, news production remains stable because these practices have been naturalized. In a second approach, news practices are more like institutions, or like constellations of rules and resources. It is the fact that journalists have investments in the resources of standard practices that explains their persistence. A final approach views news practices as constitutive, in the sense that they enact a basic understanding of what counts as an instance of journalism. They are difficult to dislodge not because they are habitual or costly to change, but because they place journalists in social interactions that reproduce a shared understanding of what journalism is.

Each of these explanations roughly corresponds to "waves" of research in the sociology of news. It is tempting to embrace one of these waves over the others. But this would be a mistake. The dynamics illuminated by each wave of research are operative in most newsrooms. In fact, they likely compound one another, making change especially difficult. I also think that the dynamics uncovered by each wave of research are not at work to the same extent at every moment. In the early phases of the transformation underway in journalism (roughly, in the early to late 1990s), the first approach was probably a more accurate reflection of the state of things in newsrooms. At that time most daily journalists viewed the Internet as an intrusion. They were comfortable in their habits and saw their practices as simply the "way journalism is done." This led them to resist efforts to align their practices more closely with opportunities afforded by the web. In a second phase of the transformation (late 1990s to early 2000s), it became apparent that the Internet presented more than a minor or transient challenge to conventional news practices. Yet, as journalists moved to develop more forceful responses, they realized that changing news practices entailed significant costs. In particular, over several decades, newsrooms had

made significant investments in core news beats that they were loathe to give up. It did not help that these choices were made at a time when the industry began to experience significant losses in revenue and profits; or that the Internet offers so few new inducements: compared to the past, there is little profit to be made – either materially or symbolically – in online news. Since this calculation remains as true today as it was several years ago, the institutional argument still explains a great deal about the stagnancy of news production.

It does not, however, explain everything. Today, reporters and editors in many newsrooms are willing to bear the costs of change because they recognize that online news is the future of journalism. Yet even these individuals continue to reproduce standard practices. Moreover, I have witnessed non-journalists, from government officials to bloggers and citizen journalists (who ostensibly have few investments in traditional practices) work to resuscitate traditional journalism rather than to invent new practices. As I watch this process unfold, I see less resistance (“I won’t do that”) and more of a simple lack of recognition of potentially new paths as journalism (“why would I do that?”).

A theory of news practices as constitutive explains these dynamics better. According to this perspective, news practices enact rules for what counts as journalism, like the notion that journalism is a practice of filtering information. These rules organize interactions in and out of newsrooms in such a way that it becomes difficult to recognize new practices as journalism unless they are put in traditional terms. The stumbling block here is more a lack of imagination: an ability to visualize what it would look and feel like to do journalism in a way that did not involve reporters acting as a filter of information from a source to a consumer. Even in a climate of “terror,” this sense of what journalism is still serves as the gravitational center of the field.

NOTES

The argument in this chapter is expanded and further developed in my book, *Will Journalism Survive? An Inside Look into American Newsrooms* (Cambridge, UK: Polity, 2012).

- 1 In this chapter I focus on the situation in US journalism, mostly because it is the context I know best, but also because a comparison with other regions – such as Europe, Latin America, or Asia – is beyond the scope of the chapter. It is also the case that the sociology of news literature has emerged mostly in the United States and Great Britain. In a chapter designed to outline this literature, an appeal to the US context seems therefore sensible. That being said, economic, technological, and political pressures are forcing changes to media systems worldwide. These changes are, of course, inflected by local conditions, but the perspective of the sociology of news is useful for capturing at least some of these dynamics. For recent efforts in this regard, see the following introductions to special issues dedicated to the topic: Boyer and Hannerz (2006), Klinenberg and Benzecry (2005), Ryfe and Blach-Ørsten (2011).

- 2 Over the past five years I have spent nearly one third of my time in the newsrooms of three US mid-sized metropolitan daily newspapers. This work involved attending news meetings, following reporters on their beats, observing news practices, and having informal and formal conversations with almost every reporter and editor in the room. As a condition of access, I have agreed to keep the names of two of these newspapers and of their news workers anonymous. However, in accordance with the wishes of Chuck Peters, the chief executive officer (CEO) of Gazette Communications, and of Steve Buttry, then editor of the *Cedar Rapids Gazette*, I have agreed to use these three real names – of the *Rapids Gazette* and of Peters and Buttry – but to keep those of everyone else in the newsroom anonymous. Also by agreement, I did not audiotape conversations in any of these newsrooms, but I compiled instead notes in nine ringed binders. Scenes from this research included in the present essay come from these binders.
- 3 For a discussion of the way in which online collaboration is challenging this constitutive rule of journalism, see Bruns (2005).

The Production of Mediated Performance

Espen Ytreberg

ABSTRACT

This chapter overviews and discusses scholarly contributions to how media production can be understood as an act of thinking about and planning communicative performances in the media. The core features of large-scale media production – advanced technology, complex organization, extensive divisions of labor – can be understood in terms of how they enable and shape performances for absent, multiple, and mass audiences. This chapter draws a rough framework of forms and levels of planning performances within media production; it also looks at some concrete examples in the production of news, talk shows, and reality programs. Finally, the relationship between performance, identity, and society is addressed via discussions of the concepts of “discipline” and the “persona.”

Today it has become commonplace in the humanities and social sciences to hold that the communicative actions of humans in social settings can be likened to performances. Theories of performance call our attention to the fact that performing is a basic aspect of social life, insinuating itself even into the ostensibly most real and authentic behaviors. Performance is, in effect, endemic to human communication. If we allow this for communication in general, it should be warranted to say the

same of communication through the media, since media performance could be seen as a subset, a particular species of communicative performance. The performances of hosts, interviewers, reporters, and stars have clear similarities to the performances we all get up to in everyday settings that do not involve media. One might say of both that they are “formal,” “informal,” or “intimate,” for instance. At the same time, it also seems plausible to say that communicating through the media makes a difference to communicative performance. We cannot all perform the ways in which talk-show hosts can; and the ways in which talk-show hosts perform, say, “being informal” may not be the same as the ways in which we perform it. After all, media performances come about in circumstances that are quite different from those of everyday communicative performances. The latter are typically spontaneous products of a relatively nonhierarchical setting, whereas the former are, as a rule, comprehensively planned and hierarchically organized.

Combining media production studies with insights from the study of performance is the subject of this chapter; and I mean possible insights as well as real ones, since there is no such thing as an established area of research into the production of media performance. What we have, roughly speaking, is a number of instances within the tradition of media production studies in which researchers have incorporated ideas and observations about performance. This work of incorporation can be placed within a wider agenda of media studies: an agenda that pays heed to the drive for an integrated approach to media production and media texts. The next section, on research strands, starts by accounting for this drive, looking into why and how production studies researchers turned their attention first to texts and then to media performances. Then research on media performances is considered in greater depth; such research is conducted within news production studies and influenced by perspectives from the humanities. Next to it comes a strand of research into media production that has combined sociology and linguistics. Here particular attention is paid to the formative influence of Erving Goffman’s late work on the production of performances inside and outside the media. Goffman is also important to the present chapter for his seminal argument for a generalized use of the concept of “performance.”¹ All situations of co-presence with others, writes Goffman, require us to adjust our behaviors. And this goes not only for “theatrical” situations and for planned forms of behavior; even daily situations of an informal, ordinary, or intimate nature require us to take on certain roles and to stick to them as the social scenario implicit in them requires. In *The Presentation of Self in Everyday Life*, Goffman famously argued that performance includes “all the activity of an individual which occurs during a period marked by his continuous presence before a particular set of observers and which has some influence on the observers” (Goffman, 1990, p. 32).

After the review of research strands that have developed from roughly the late 1980s until today, the section on four fields of inquiry introduces and exemplifies some key fields of research. This section draws mainly on the author’s own research on non-fictional television and other forms of broadcasting over the last 20 years (Ytreberg 1999, 2002, 2004, 2006, 2008). A conceptual framework is used that builds on the basic premise that media production can be seen as a set of particularly com-

prehensive plannings of communicative performance, by means of modern forms of technology and organization. Here media performances are seen as the combined result of planning techniques (for instance through various scripts and logistical procedures) and performance techniques (for instance through various body and memory practices). The chapter offers analytical illustrations that focus on the nuts and bolts of how performances in media production concretely come about.

The concluding section discusses how the production of media performance relates to wider issues of society and personhood. Here the focus shifts back from a predominantly empirical level to a predominantly conceptual one. A basic fact about the great majority of media performances is that strong forces lie behind them that have demands on and stakes in the performer. There is the editorial team above the line, the technological operators below the line, and the management team in the media organization. At a more general level, there are forces of society that define what one might call a communicative climate of dominant and preferred behaviors. These all wield power over the performer. They contribute to shaping performances and – in time – to shaping the performing individuals as well.

Production of Mediated Performance: Research Strands

Media studies has become established as a loose federation of subdisciplines that have come to pursue research agendas relatively independent of each other.² Media production studies have largely concentrated on issues intrinsic to production teams and organizations – such as journalist–owner relationships, professionalization, gate-keeping, and questions of creativity versus constraint. These issues are, of course, important and valid; but, even if media production processes are worth studying in their own right, it makes limited sense to divorce them from one of their core purposes, namely that of generating communications that are able to capture an audience.

This state of affairs changed roughly from the early 1990s on, as media production studies incorporated a broader range of insights from the humanities. There was a particular interest in the way media production crucially involves understanding and putting to use conventions of mediatized representation. The insight that media production importantly involves knowing how to construct and tell a story led to production research that was sociological but also drew on narrative theories and analyses (e.g., Bird & Dardenne, 1988; Jacobs, 1996; Schudson, 1995). Media production could also be said to involve a construction of genres (e.g., Bruun, 2010; Ekström, 2002), of aesthetics (e.g., Born, 1993; Caldwell, 1995), and of formats (e.g., Ytreberg, 2004). Common to all of these research contributions is a view of production as vitally involving meaning-making and communicative conventions. Producing media is seen as centrally a matter of understanding the requirements of such conventions

and of putting them to use in production, in the process conforming to them, adjusting them, and occasionally also challenging them.

A key aspect of this development in media production studies – and one that this chapter will develop – is the growing acknowledgment, among media researchers, that much of media production could be seen as a production of performances. Analyses relying on a notion of communicative output as “text” tended to work with notions of textual structure that did not leave much room for considering people’s bodily appearance and actions. Also, the importation of the notion of “text” from literary studies into media studies contributed to an emphasis on language and to a corresponding lack of attention to auditive and visual aspects of communication in media. The result was a tendency toward disembodiment in analysis. Insofar as actual persons and bodies were considered, they were routinely subordinated, as “functions” of some narrative or generic sets of requirements. As a consequence, not much was made of the myriad movements, looks, postures, gestures, and comportments that fill our screens.

Performing Journalistic Authority

An important early move toward performance in media production studies was provided by Barbie Zelizer from within the tradition of journalism research. As part of a “humanistic inquiry into journalism” (Zelizer, 1993), she proposed looking into the established research area of journalistic power by using other tools than those traditionally offered to journalism studies by mainstream social science traditions. Power is not just a matter of one person intentionally producing effects on other persons, Zelizer argued, but also a matter of providing the basic frameworks for action and representation. Following the work of performance theorists such as Victor Turner and Richard Schechner, Zelizer proposed to deal with the communicative actions of journalists via a “performance frame”: “When seen as performance, news is understood as a situationally variant process [. . .] this frame may turn out to be particularly useful for considering journalism” (ibid., p. 82).³

In several publications from the early 1990s (Zelizer 1990a, 1990b, 1993), Zelizer explored issues of power and performance via the case of journalistic authority. Clearly, the authority of journalism is communicated through the personal authority of journalists’ performances. Equally clearly, this authority is not, primarily, a product of the individual journalists but of larger, collective entities – such as the institution of journalism and broadcasting organizations. Somehow the authority of, for instance, a BBC news bulletin rests both on its being recognizably a work of professional journalism and on that public service broadcaster’s output. Here the performers must carry a heavy load, embodying and acting out key virtues such as credibility, objectivity, and authority.

Such performances require effective and seamless sets of conventions. The authority structures of broadcast news had been analyzed before Zelizer’s work. Charlotte

Brunsdon and David Morley (1978), for example, noted a clear and uniform hierarchy of authority in studio-based news broadcasts, the anchorperson being at the apex. From the desk in the studio, the anchorperson connects the viewer to the world and connects the persons in the news to the world and to each other. Various combinations of conventions – direct camera address, logo superpositions, set phrases such as “here is the evening news with NN” – combine to establish the anchorperson’s authority. At regular intervals, the authority of the anchorperson is delegated to reporters on location or to experts – but only in part, and only for the duration of one news item. A further hierarchy of authority is established between reporters and the people who are in the news either because they are personally affected or because they witnessed the events covered. These people do not come to address the news audience; they only address reporters, and they do so only by way of answering questions. Broadcast journalism’s conventions are set up so as to make sure that the journalistic authority always intercedes between the people in the news and the people in the audience.

This positioning requires that journalists assume personal responsibility for finding and telling the story. Zelizer is interested in – and she looks at – how such a personal assumption of authorship and authority is concretely achieved. For a number of reasons, the journalist may not be as close to the news event as the assumption of authorship and authority suggests. Journalists routinely rely on satellite relays, wire services, and different types of second-hand reports of a news event. Zelizer argues that journalistic authority rests on a set of routinized journalistic conventions for asserting proximity or for creating the impression of being personally close to the news, regardless of whether the journalist actually is close or not. Journalistic proximity “emerges as much from organizational practices which lend an illusion of proximity as from the actual nearness of a journalist to an event” (Zelizer, 1990b, p. 38). Zelizer pursues this illusion of proximity in qualitative analyses of the National Broadcasting Company (NBC) and of the Columbia Broadcasting System (CBS) evening newscasts that focus particularly on the role of anchorpersons. She finds a set of “presentational practices” that are used throughout to assert proximity between the news event, the journalist, and the broadcast. The so-called “slugs,” or identifications, do much of this work. A formulaic slug such as “Bill Plante. CBS News. The White House” manages to unite the three parties symbolically in a matter of seconds (1990b, p. 41). The effect is particularly interesting in cases where the journalist is physically far removed from the news event. Zelizer discussed the case of a report introduced through the name of the reporter, but without identification of place. The report then introduces the scene of the news event – Boston – but omits information on the location of the reporter who narrates in voice-over. A sense of connection between reporter and place is thus established indirectly. Only after the report is the reporter’s location disclosed – for example, “Lesley Stahl. CBS. Washington.” Thus a performance of symbolic proximity, in the absence of physical proximity, works to establish journalistic authority.

Production and Participation Frameworks

By focusing on how production is shaped by the requirements of texts and performances, Zelizer and other sociologists of media production have been able to demonstrate the importance of collective interpretations and representational practices to media production. They have been less concerned with how the production of performance can be related to roles and functions in the production process. This has been done in a strand of work that originates with the sociologist Erving Goffman and has been taken up primarily by researchers with a strong interest in the interface between sociology and linguistics.

Goffman's work on what he called the "production format" of performative utterances was formulated in terms of a general theory of communication. It is worth noting that Goffman's prime example was that of broadcast communication.⁴ In several late works (1974; 1981a; 1981b), Goffman proposed to divide the production roles according to the share that different parties have in the performance. He suggested that a production format is the result of a certain constellation of "originating," "authoring," and "animating" an utterance. The "animator" is the visible and audible body in performance, which brings scripts and plans to life in a communicative act. The "author" puts together the words and other concrete features of the performance. The "originator" is the entity whose views and positions are represented in the performance. In everyday interactions outside of the media, one individual will typically take care of all these roles. For example, the person who utters "Hi Judy, nice day" upon meeting a friend is also the person who composes the words and whose point of view is being expressed.

Media production systematically splits these roles among a number of people by means of organizational hierarchies and divisions of labor. Management originates, scriptwriters author, and performers animate. In traditional high-prestige newscasts, formality and a certain de-individualization signal the fact that an author of considerable prestige is "speaking through" the animator. Talk shows, on the other hand, feature hosts who seem to come up with what is said by virtue of their innate verbal prowess, then and there. Not only animating, but also authoring and originating seem to emanate from them. In broadcast communication, this embodiment is a simulation and an illusion, writes Goffman (1981b), albeit a successful one.

Research building on Goffman's concepts has tried to expand and supplement his list of roles in order to match more closely the issue of responsibility for the performance with the professions and organizational structures of media production. Writing on the production of news language, Allan Bell has proposed a number of subroles in order to flesh out Goffman's original three. An example is his suggestion that the role of editor should be distinguished from that of the author, because the latter formulates a draft text for performance, while the former modifies it (Bell, 1991, pp. 36ff; see also Kress & van Leeuwen, 2001; Levinson, 1988).

Goffman makes connections with production formats and actual performances both conceptually and in the analyses of concrete media performances. Conceptually, he emphasizes how the production format is closely matched with what he calls the “participant framework” of the output. It is axiomatic for Goffman that the broadcast performances of hosts and anchorpersons take place in a social situation and for various participants in the process of communication. Some participant roles involve direct participation, as when guests interact with hosts on talk shows and interviewees interact with interviewers on newscasts. In broadcast communication there are also “ratified parties” with whom communication is more indirect, primarily studio- and home-audiences. As for concrete analysis, both Goffman himself (1981b) and other researchers building on him (Brunvatne & Tolson, 2001; Clayman, 1992; Hutchby, 2006) have analyzed the ways in which performers take on the roles of animator, author, and originator. Sonia Livingstone and Peter Lunt (1994) have looked at the case of audience discussion programmes on TV. They point out how the psychological profession acts as a collective originator behind the utterances of expert psychologists in therapeutic talk shows. This brings to the programme a participation status that is superior in several respects to that of the lay participants. The latter participants get to report their experiences and feelings, while representatives of the profession are authorized to pass certain kinds of judgment on them. On the other hand, the lay participants gain an authenticity that is not available to experts by speaking on their own behalf and in a manner that conflates the animator, author, and originator (Livingstone & Lunt, 1994, pp. 128ff).

Research on production and participation frameworks has also looked at the often complex and subtle ways in which shifts in one framework (in what Goffman calls “footing”) are connected to shifts in another. For instance, newscasters routinely go from delivering a monologue to the home audience through direct address to camera, into a being an interviewer in a studio interview segment. The address to camera is typically scripted and places the newscaster in a formal mode that clearly signals the presence of an originator distinct from the animating newscaster. Here the newscaster’s utterances will typically be characterized by high “modality,” which refers, in linguists’ parlance, to the features of texts that “express speakers’ and writers’ attitudes toward themselves, towards their interlocutors, and towards their subject-matter” (Fowler, Hodge, Kress, & Trew, 1979, p. 200). When the newscaster shifts to interviewer mode, the performance routinely takes on a less manuscripted character. There is a subtle shift in alignment as the newscaster seems to move toward taking some share in the origination of her or his utterance questions. At the same time a subtle shift in modality takes place (as discussed in Montgomery, 2007, p. 30). The reporter is, typically, somewhat noncommittal toward the propositional content of what is being discussed, demanding a stand on the issue from the interviewee, but not taking one for her- or himself. These are fine nuances, which speak to the accomplishment of human communication and to the ways in which media have introduced yet more layers to that accomplishment. At the same time, the nuances are

far from being innocent ones. The duties and entitlements of various performers in the participation framework of broadcast communication tend to be unequally distributed, an array of communicative privileges being granted to those performers who represent roles in the production framework.

Production of Mediatized Performance: Four Fields of Inquiry

The existing research on the production of media performances has been developed in fits and starts within different research environments; hence it is necessarily patchy. Important areas of study are underexplored or virtually unexplored. The following sections outline and develop four such areas of study. Three of them foreground an interest in the stages of production that are closest to the performances themselves and provide the most direct influence on them. Other common threads are the management of bodies via media technology and various kinds of scripts. A key and underlying issue is that of how media performances are, for the most part, very comprehensively planned, even if they may seem spontaneous and “fresh.” The analysis of the performance itself is not foregrounded, since the research outlined above is relatively rich in this respect.

Direction for Performances

As a rule, the planning of performances that goes on in large-scale media organizations involves media production teams both above the line (e.g., producers, writers, floor managers) and below the line (e.g., camera operators, costume designers, makeup artists). Indirectly, they also involve editorial and management levels of the organization. In various ways and to varying degrees, all these people have a stake and a hand in the performances. Thus the planning of mediatized performance routinely becomes comprehensive throughout the organization. Planning runs the whole gamut, from very concrete instructions and proddings before and during the performances themselves, to policy and strategy work that establishes underlying premises for performances.

Closest to the performance itself in terms of spatio-temporal proximity is “cueing,” or directions given to performers during and immediately adjacently to the performance. Cueing is an important part of setting up the occasion of a performance. A main long-term tendency in current non-fiction broadcast programming has been to try and avoid “staginess.” A feel for the informal, the intimate, or the authentic seems to require the avoidance of overt signs that the performer is being told how to perform. This poses at once a practical problem, since extemporized performance is

Table 15.1 *Par-i-bol*, NRK1, August 28, 1992. A word table has been used here to provide an approximation of the script's layout

Source: *Par-i-bol*, NRK1, August 28, 1992.

harder to control. For instance, a verbatim manuscript can be timed quite accurately in advance, whereas the time of extemporaneous performance must be kept by the performer while performing.

Aside from cues, giving kernel information is another way to provide direction in order to control extemporaneous performance. Kernels are items of condensed information on what to say or do in a particular section of the performance. Kernels often feature in scripts, but they can take the form of memorized sentences or phrases that can be incorporated into an otherwise extemporaneous stream of talk.

Table 15.1 provides an example from a Norwegian popular journalism news and current events TV program from the early 1990s called *Par-i-bol*. The script was handwritten collaboratively between the two main hosts, Lottelise Folge and Lars-Jacob Krogh (*ljk* in the script); it was made in order to sort out their turns at talk in a segment. The sequence involved introductory information for a debate sequence on European Union membership, to be shown after a news bulletin. This particular script employs several forms of kernels for the talk, from a one-word condensation of what is to be said in turn ("Daring") to condensed questions and statements. The bottom of the script illustrates another key means of directing the specifics of personal performances: what could be termed "turn scripting." Turn scripting indicates who gets to talk and when. It is in use in scripting the coordinated performances of more than one person. The more detailed variants indicate each speaker's turn to talk in a sequence; this is necessary if the production is live, as well as technologically and logistically complex. However, short-hand versions seem to be more common. Some turn scripts only indicate who starts the sequence and who closes it. The framing and nomination of ratified participants involves names, titles, and other

credentials, which such turn scripts are made to help the performer remember. The *Par-i-bol* example in Table 15.1, which covers the signing-off part of the sequence, shows both kernel and turn scripting at work. There is a nice twist in the way this “outro” (I mean, this opposite of an “intro”) actually scripts the turn to happen as an interruption from a ratified participant, with the words “I’ll have to break you off there”).

The need for an extemporaneous and ongoing assembly of the performance, what Goffman (1981b, p. 227) calls “freshness,” makes it potentially awkward for the TV performer to carry around a clearly visible script during performance. The choice is either to hide it or at least to make it look inconspicuous, marginal to what is “really” going on in the performance. So a number of script-hiding devices are in use for “fresh” performances. The most technology-specific device is perhaps the teleprompter; but there are more prosaic ones, such as checking the script during off-camera breaks in the performance. A much used alternative is the helper in the stage wings of production, who cues the performer. During performance, the producer will generate reminders, for instance of time limits, and s/he may suggest lines for the performers, for instance appropriate interview questions. Most major live formats, where the logistics of performance are extremely complex and relatively unpredictable, depend heavily on this technique. Cues are made either visually, through gesticulation, or aurally, through (often wireless) microphone systems. Various conventions exist to make this effective. The producer countdown to the host during performance is one commonly employed verbal convention (“20 seconds [. . .] 10 seconds [. . .] cut now!”). The gesturing equivalent, sometimes used by producers who have eye contact with the performer, is a cut-throat hand slash. This illustrates a more general point: the professional performer is effectively communicating not just to absent audiences, but also to members of the production personnel, who are hidden in the stage wings. Broadcast communication to the audience has to be managed jointly with collusive communication back toward the production staff. Performers must be able to do this in sometimes very taxing circumstances, such as by talking to audiences while simultaneously listening to producer directions through earphones or earbuds.

Direction immediately before or during performance may be seen as the last stage in a process of teaching and learning, directly and indirectly, which starts when the performer first encounters the production team. In the case of professional performers, this process may take a number of years and is correspondingly hard for researchers to follow. A major work in this area is Laura Grindstaff’s production study of daytime talk shows, *The Money Shot* (2002), which describes in some detail how talk-show participants are made ready for performance. The process is quite elaborate and involves a number of stages. First, contact is usually made in pre-interviews over the phone, during which production team members ask questions in order to find out not only what the prospective participants have to say, but also what their storytelling skills are and whether they have the requisite emotional appeal. Follow-up conversations give more background information and also provide a chance to do

what Grindstaff calls “maintenance work” on the person’s willingness to comply and perform. When participants arrive backstage before taping, there is “prepping and coaching,” reminding participants the order of events’ and the format’s performance requirements, as well as putting them in the right frame of mind. For daytime talk shows, this typically means encouraging participants not to hold back on emotions, to “cut loose,” and to “let it all out.” All of this direction involves a risk of producing an unwanted artifice in the performance. As Grindstaff shows, a constant conflict is involved between the need for control and the demands of a performance that has to look spontaneous and fresh:

The mandate for spontaneity [. . .] exists in tension with another equally important one: getting guests to condense their stories and speak concisely, homing in on the important elements first – in other words, getting guests to tell their stories in sound bites, following the conventional pyramid structure employed by journalists. (Ibid., p. 100)

This type of “prepping and coaching” is primarily a matter of spoken communication between guests and production team members. Still, the production of broadcast performances relies on extensive forms of written materials, particularly scripts.

Scripting Performances Outside of Talk

The word “scripting” is used in bewilderingly diverse ways in a number of traditions of academic research. This section focuses on an extended sense of the word, often used in professional literature on the media. On the one hand, it is used more or less synonymously with “manuscript” and refers to documents detailing what the performers say (for instance the kernel script described in the previous section). It follows from this use of the word that performances that do not use such manuscripts can be called “unscripted.” A different and more extensive use can be found in the literature of screenwriting manuals. Here a “script” outlines the talk of a performance, both its sequential order and its spatial settings. In this sense, a script coordinates not just the performance but also its mediatized context and time sequencing – not just the talk, but also the sounds and images (Ytreberg, 2006).⁵

Following this wider use, one can say that a script is a document, in paper or data file form, sometimes handwritten or typed, but nowadays usually computer-generated. It contains information in verbal, visual, and/or graphic form on key aspects of media performances, coordinating the work of those involved in, or affiliated with the production of, media performances. A script is prescriptive in the sense that it is basically geared toward giving direction on how future productions should be carried out. However, the registers of scripts themselves are most often matter of fact and descriptive. Perhaps most vital to media production is the main script – a standard feature in film, in broadcasting, and in the production of multimedia applications.

There are of course innumerable variations across media and genres, from shooting scripts and storyboards in film to the teleplays of television and the so-called flow charts of interactive applications. Still, most of them incorporate a timed overview of the output sequences (e.g., film scenes or news bulletins), information on what goes into every sequence (e.g., words/talk, video/audio sources), and information on handling the requisite technology (e.g., camera choices, cues). Main scripts thus contain vital information on performances, technology, and logistics; in a sense, they serve as a meeting point between the three. Manuscripts for verbal performance are usually auxiliary in relation to the main script, and they are sometimes inserted into it. Such auxiliary scripts are made to serve the specific needs and requirements of various professions involved in production. As the performer has his or her manuscript, the designer has a floor plan and the cameramen have camera shooting scripts. Only some of these scripts are used by the performers themselves; but all of them affect the performance. A main script sets the basic pace of the performance by blocking and timing a program's sequences – including its conversations, monologues, and segues. For instance, the pace and sequencing set by an evening news programme requires compressed delivery and highly formulaic segues between elements.

Scripting, then, is about far more than spoken lines; it is used to plan basic spatial and temporal parameters for the performance. This section will elaborate on one important type of script for shaping the space and the social setting of a studio: the floor plan. Figure 15.1 shows an example taken from the production of *Wiese*, a Norwegian prime-time soft journalism program studied in the early 1990s. This floor plan lays out a standard studio-based, multi-camera setup for cameras and their movements, pre-setting certain camera coverage options. In doing so, the floor plan also sets up the performance in a number of very concrete ways. Studio walls and passageways indicate quite precisely the space the performer has to stand in and move through (as indicated in Figure 15.1 as “café 1” and “artist scene”). These sorts of studio sets are constructed so that the performer can always be in the unobstructed, well-framed view of the camera and clearly audible via mikes, although the live broadcast involves a number of sequences in different studio subsettings. Typically sets will be constructed for the performer to move from camera to camera, sometimes by using markers on the floor, because these movements have to end up in specific places. An example to the above right of the *Wiese* studio plan is the “alleyway” (*smuget*), where the host is framed and set up to move forward, toward and along a set of static and dynamic camera options. The setup ensures continuous address to the camera and at the same time makes the performer frontally available to the viewer. When the host moves in the studio, this means that he or she will have to address one camera first and then another, with no lapse in between. The real-time address shift between cameras has become a standard device for dynamism and variation. In real-time multi-camera studio settings, such shifts between cameras frequently have to be done while the performer is moving physically. This usually requires studio rehearsals in which the performer memorizes movements and camera address shifts to a point reminiscent of the internalization used by dancers and actors.

Figure 15.1 Floor plan, Wiese, NRK1, 1992. Source: Wiese, NRK1, 1992.

In recent television production, the traditional division between constructing a social setting in the studio and registering what happens in a preexisting (“location”) setting has become increasingly blurred. The production of a live major event tends to take place in a setting that is so media-saturated that it comes to resemble a studio-type situation, even if its rationale is still tied to the ongoings of an outside world. This is the case, for example, with major sports events, in which the stadium or arena is increasingly occupied by sound and camera equipment, and in which the event spaces themselves are lined up, angled, and proportioned for this coverage. There are also ancillary spaces specifically for the mediation of the event, such as the setting of the post-race soundbyte, or the studio-in-the-stands, where hosts, experts, and athletes meet up to preview and review the event itself.

The reality show *Big Brother*, an internationally successful format generated from the first Dutch version in 1999, also famously extends this tendency in sometimes drastic ways. It is an extreme, hence instructive, case of how comprehensively current television can set up performances by scripting social settings. Television in this case builds from scratch a social setting that contains the performer’s whole life, at least for a number of weeks. Audiences know that this type of reality program may include

Figure 15.2 Floor plan with camera setup, Norwegian *Big Brother*, TVNorge, 2001. Source: Norwegian *Big Brother*, TVNorge, 2001.

even the most private parts of everyday life (e.g., slander, sex, drunkenness). Yet few people know how the scripting of ordinary people's lives is actually managed. Several important forms of scripting for the production of *Big Brother* provide interesting leads. One is the "technical plan." All versions of this format build from scratch a "Big Brother bunker" where the participants are locked in for the duration of the competition.

The combined building layout and camera plan shown in Figure 15.2, as well as other information on Norwegian *Big Brother*'s production, are taken from Anders Lindstad's master thesis on the 2001 series of Norwegian *Big Brother* (Lindstad, 2003). In practical terms, the *Big Brother* social setting is a container built to house the apartment and multi-camera production facilities. Following a sort of reverse panopticon principle, the participants' living area is surveilled by a ring of cameras and microphones (which supplement the participants' body microphones). As indicated on the *Big Brother* technical plan, the camera setup combines automatic surveillance-type roof cameras and cameras hidden behind one-way mirrors (shown in separate rooms marked "Kam" in Figure 15.2). There are also mini-cameras, for instance one in the bathroom (shown in the lower left on the plan), which is mounted on the shower head. Not indicated on the plan are a number of roof-mounted microphones designed to supplement each participant's body microphone.

Figure 15.2 shows a comprehensive and professionally challenging production setup: the production team needs not just to expose rudimentarily what is going on, but also to disentangle the specifics of who is saying and doing what to whom, in a room that is often crowded with participants. Basic production techniques like the match-on-action shot and the foregrounding of relevant sound sources become quite difficult when there is no script to dictate these ensemble performances.

The scripting of *Big Brother's* social setting attempts to contain the uncertainties over what participants will say and do by making possible an extensive ritualization of domestic life. The bunker living area more or less has a typical apartment room layout, with spaces for social interaction: the sofa sectionals, the dinner table, the kitchen bench and table, the backyard. However, these are also the spaces for a series of ritualized actions imposed by the production team; voting ceremonies, contests, and various assignments are introduced to keep the participants active and the social interaction going. The sofa arrangement doubles as a setting for the regular voting out of participants. The backyard doubles as the site for assignments of a more physical nature. This, then, is a private house setting, the traditional arena for relaxation, layered over with competitions and ceremonies that are anything but relaxing. The private home is a prime site for authentic communication, since it is conventionally associated with individualized and “fresh” performances. Still, the scripting of *Big Brother's* social setting makes it possible to overlay the home setting with a steady stream of competitive rituals. This has the effect of making even an amateur performance without a manuscript into something that is still scripted and, hence, considerably more controlled and predictable.

Policies for Performances

The scripting of talk and of the spatio-temporal parameters of performance impacts the performer in very direct and concrete ways. Some aspects of production have a more indirect impact, which is still important. “Policy” in this section refers to overall guidelines for outputs that are provided or overseen by a media organization’s management. Policies seldom focus on specific performances. Still, a number of policy decisions and documents are salient to performance. The connection is perhaps most evident in formats that are built around individuals. Here the whole realization of a production hinges on managing to sign “talent,” someone around whose performance track record the format will be built. One may also include in the policy category certain documents that provide overall guidelines for performances and their mediation. Examples of such guidelines in television include the format “bible,” which is a reference document used to plan and standardize key features of a television series. The bible is an important part of the buying and selling of format rights, which is usually a policy-level decision (see also Chapter 12, this volume). This section examines how policy-related documents guide performances in broadcasting organizations.

Reality TV format bibles are interesting for the quite extensive ways in which they plan performances. They offer a kind of main script, in that they convert the inherent time structures of certain rituals (a voting, a competition) into chronologically timed and sequentially blocked units. Format bibles in reality TV are hard for the researcher to come by, but they seem to be strongly focused around temporal unfolding, explaining it in considerable detail. There are good reasons for this; not only the time structure of the programme series, but also the logistic and technological challenges of its production follow largely from the basic ritualizations that the format requires.

Figure 15.3 is an excerpt from the format bible to the American reality programme *No Boundaries* (2002), a contest involving trekking-type challenges and a voting out procedure designed to eliminate gradually everyone but the winner. Excerpted is page 7 of a 61-page bible that is structured almost in its entirety as a chronological

Overnight: Kennedy Lake

It's the night before the very first removal. Even though they've only been together for two full days, nothing brings out the best and worst in people like shared experience – especially when the experience has been challenging, taking each contestant out of their comfort zone and pushing them to their physical and mental limits.

Tonight, as they set up camp and sit around the fire chatting and resting, the contestants will all need to be jockeying for the leader's favor because tomorrow the leader bids farewell to the first contestant removed from NO BOUNDARIES.

As the sun sets on the night before the removal, the Leader will have to go to sleep thinking about the important decision he or she must make the next morning.

Figure 15.3 Format bible excerpt, *No Boundaries*, Outdoor Life Network, 2002. Source: *No Boundaries*, Outdoor Life Network, 2002.

run-through of the competition's stages and various rituals. The excerpt shows how the bible outlines not just the basic rituals of the competition itself, but also attendant rituals, such as the evening campfire get-together. It indicates some key features of the performances, as well as key modes of participant behavior (such as "resting," "jockeying," and being "out of the comfort zone"). Given that the reality genre imposes a taboo on manuscripts, it is presumably difficult to plan just how much jockeying will happen. Cameramen will have to go with the flow of what happens, and this is difficult. Hence the tendency, in these types of format, to stage events and actions that the cameras would not capture the first time around. However, it counts for a lot in terms of practical production that jockeying will happen – or that something will happen that can be interpreted as jockeying. The cameramen will be in the right place, set up and ready to capture what is, ostensibly, about to occur naturally.

The "personalities" of the main performers are basic to the appeal of many genres in the electronic media. Therefore they are dealt with on an overall policy level. Some quite extensive examples are found in fictional genres such as the soap opera and popular drama series. Here it has been a common (although variable) practice for the main scriptwriter to write up the basic characteristics and the biography of key characters. A team of scriptwriters then turns these basic characteristics into actions and lines in individual episodes. In comparison, non-fiction scripting seems on the whole to be less comprehensive. Bibles and format handbooks will often contain a description of the ideal characteristics of hosts and other participants, but rarely in very concrete or detailed terms. Still, the production of many non-fiction formats involves the formulation and deployment of a policy for cultivating performers' personality characteristics. This typically goes on in seminar-type settings, when production teams break off from the daily schedule to take stock. Seminars will often involve the producers writing memos to be distributed subsequently. The memos provide a more or less authorized view of how the format and its performances need to be reformulated or adjusted.

These memos may provide a sort of ideal description of the format's key personalities. Table 15.2 is an excerpt from such a memo, providing something of a recipe for a certain type of host's performance. It was written by the heads of the production team, when they made the youth radio current affairs program *Mamarazzi*. An observation study of the production of *Mamarazzi* (Ytreberg, 2002, 2004) observed that this memo did matter to production staff, although it was not referred to on a daily basis. The memo did not seem to function like a recipe or a checklist; rather it provided a background reminder and a fleshing-out of what the basic premises for production were. The production team's allegiance to the basic values described above, such as genuineness and realness, was a more or less unanimous and taken-for-granted thing. The memo's function was to remind performers of key considerations that were already ingrained in consciousness. It reminded the members, in the last instance, of how to be when they were in performance mode: genuine, personal, critical, and so on. One might say the memo was ultimately concerned with

Table 15.2 Memo, *Mamarazzi*, P3, 2000. A word table has been used here to provide an approximation of the script’s layout

PROGRAMLEDERNE I MAMARAZZI:	THE MAMARAZZI HOSTS:
• Skal være ekte, men ikke selvhøytidelige • Skal være personlige, men ikke pinlig private • Skal være kritiske, men ikke ondskapsfulle • Skal være fandenivoldske, men sympatiske • Skal være hovedpersoner, men ikke på bekostning av gjestene • Skal være underholdende, men ikke flåsete	• Should be genuine, but not full of themselves • Should be personal, but not embarrassingly private • Should be critical, but not mean-spirited • Should be gung-ho but sympathetic • Should play a main part, but not at the guests’ expense • Should be entertaining, but not flippant
GJESTENE I MAMARAZZI:	THE MAMARAZZI GUESTS:
• Skal være virkelige De er ikke rollefigurer – de skal ikke late som om de er noen andre enn det de er. Lytterne skal tro på dem. • Skal være midtpunktet under samtalen Selv om programmet er programleder-sentrert, er inviterte gjester midtpunktet i studio og i lytternes ører. [. . .]	• Should be real They are not actors – they should not pretend to be someone they are not. The listener must believe in them. • Should be the center of attention during conversations Even though the programme is host-centered, invited guests are the center of attention in the studio and in the listeners’ ears. [. . .]

cultivating a certain kind of performer, maybe even a certain kind of person. The formation of a professional performer is a time-consuming thing, however. It is obviously not something that can be accomplished via one script or via one instance of media production. A longer process of training is involved.

Training for Performance

Media performances require various forms of performer competence. One such competence is the ability to commit elements of the performance to memory; another is the facility to produce a stream of reliable talk under demanding conditions. Manuscripts can take care of some of this, but not all of it. Performances such as those of disc jockeys (DJs), of talk-show hosts, and of sports commentators simply contain too much talk, and they need to sound fresh and spontaneous. Hence performers tend to rely on internalized formulae. Researchers have noticed interesting similarities between media broadcast performances and the performances of oral

poetry and other premodern forms. They are all highly dependent on various types of formulas, set phrases, and expressions learned by heart and with the aid of rhythm and music. A formula is “a group of words which is regularly employed under the same metrical conditions to express a given essential idea,” according to the oral tradition scholar Milman Parry (cited in Lord, 1960, p. 30).

Paddy Scannell and Graham Brand (1991) have pointed out that broadcast performances also routinely require that a repertoire of set phrases and other formulas for talk are built up so as to be available on instant call. In the case of radio DJs, extemporaneous speech must be kept up in stretches of several hours. But the introduction of new technologies of communication also changes performance; this general point is emphasized by the communication historian Walter Ong (1971, 1988), for whom changes in media technology are the watershed between the oral and the literate world. The introduction of writing means that instructions can be written down, codified, and made more permanent. In this way the formula can be imposed on the performer through an external trigger. Thus writing enables a more intense scrutiny of performers and a more comprehensive manipulation of them. In modern large-scale media, this routinely happens through elaborate forms of training for performance – by way of dedicated courses and various other kinds of training.

Training for the purpose of seeming informal on the screen produces a performance that resembles, but is not the same as, everyday informality. To use Ong’s vocabulary from his seminal *Orality and Literacy* (1988), the orality afforded by electronic media is “secondary,” in the sense that it is based on writing practices in production. It deals, paradoxically, with the “planning of unplanned events” (Ong, 1971, p. 285). Extemporaneous performances in the media, then, may have a fresh feel to them, but this will be the result of a very different process from everyday informal talk. Among other things, quite extensive training goes into handling the technology and the scripts so as to make it possible to extemporize in circumstances that are likely to make the untrained fall silent. Further, there is always a need for editors and management to ensure that performers are reliable. Hence the formalization and professionalization of performance training has become common in modern large-scale media. There are even some formal educational programs for becoming a host or a news presenter; these are available both in media organizations and in universities.

The practices of training for professional performances have not yet been much studied, but should present a rich area of inquiry for those interested in how media performances are produced. Again, a possible starting point is Goffman’s (1981b) analysis of how the “freshness” of the professionally trained broadcaster differs from everyday behaviors in non-mediatized settings. The broadcast performance is more correct and more fluent than everyday performances, Goffman argues, but it secures a “fresh” feel by using a repertoire of set phrases. When slips and falterings occur, professional performers have the ability to regain control and fluency in a way others do not. Broadcast performers, as a rule, stick to the requirements of format and genre. Whereas performers in informal interpersonal communication enjoy a lot of leeway to segue

loosely from the informal to the formal and back, a talk-show host must stick reliably to informality. As Goffman puts it in the case of station announcers who seek to combine their scripted and informal performances:

Competent announcers with the permission of their stations editorially elaborate on their copy extemporaneously in the course of reading it, thus appreciably strengthening the impression of fresh talk overall. [. . .] Yet when one examines how this editorial elaboration is accomplished, it appears that a relatively small number of formulaic sentences and tag phrases is all that is needed. Providing that any one use of a particular remark does not follow another use of the same remark, the illusion of spontaneous, creative, novel flow is engendered. (Ibid., p. 324)

The process of training for these competences is a process of adjusting one's personal communicative repertoire. Becoming a news presenter means that one must suppress the effervescent traits of one's personality and boost the restrained traits. Becoming a reality TV participant often requires the opposite adjustment. Whatever the ratio between suppression and boosting, there is clearly an augmentation of an individual's communicative repertoire for the purposes of media performance. Such augmentation of individuality has been described quite succinctly by one broadcaster interviewed by researchers Andrew Tolson and Catherine Roberts:

The performance that good presenters give is of themselves. But a little more so. If offering advice I'd say "be yourself," but with both the colour and the contrast knobs turned up a notch. You have to break through the screen, not by raising your voice but by raising your personality a touch. (In Tolson, 2001, p. 447)

Not surprisingly, such boosting of oneself is emphasized in television production but the need for self-suppression is not, since the latter is harder to square with ideals of authenticity. Ostensibly it is one's "true self" that gets augmented in this way. As Tolson (2001) has argued, however, appeals to such true selves become problematic in media settings that seem to impose their own frameworks for defining what that self actually is.

Performance, Identity, and Society

So far, performances have been looked at from the standpoint of production. Much has been made of the ways in which mediatized performances are extensively marked by the processes of planning, logistics, and technology management that lie behind them. Still, a focus placed exclusively on these specifics of media production will not explain performance fully. At least two further factors should be brought in: individuality, and society. The individual clearly brings to media production something that

matters: an already developed communicative repertoire and an already formed sense of self. The trajectory of training and adaptation to production then seems to make some marked differences to that performer, extending perhaps to his or her very sense of self. As for society, it has been pointed out above, in some detail, how media production involves considerable forces that stand behind the performer, so to speak, and act on performance. These forces are a feature not only of individual media institutions, but also of the institutional structure of contemporary society. So the power wielded over the media performances that was discussed in this chapter could be seen as a particular instance of how power is wielded over performances in society more generally.

The close monitoring and extensive planning of performances is by no means specific to today's media institutions. A number of important research contributions from the social and human sciences suggest that, on the contrary, this is a widespread feature of institutional communication in contemporary Western society. It seems particularly prominent in the service sector. Deborah Cameron (2000) has documented the extensive monitorings and disciplinings that call center operators are subjected to. Arlie Hochschild (1983) has investigated how air hostesses are trained by their employer organizations to internalize and discipline certain forms of emotion in performance. Speaking more broadly of postwar Western culture, the performance theorist Jon McKenzie (2001, p. 55) has observed that we routinely speak of organizations' abilities to "perform." He sees in this an expansion of the performance concept whereby it comes to be associated with management, with demands of review and of efficiency. Following Michel Foucault (1977), one might say that the power exerted over media performance is an instance of more general processes of surveillance in modern societies whereby organizations exert power over bodies and over individuality. Although Foucault's preferred example is the prison, he investigates some much more general organizational procedures. Modern organizations are about systematic and exhaustive training, about "meticulously controlling the operations of the body," as Foucault (1977, p. 137) puts it. Discipline here does not imply particular kinds of restrained or formal behavior. The discipline of a talk-show host, for instance, is evidenced in an ability to be reliably and consistently informal, jokey, and effusive. It does mean that a very extensive regime of training is imposed on the individual by an organization. In media, this is the training designed to make one cope with technology, with the logistics of plans and scripts, with format and genre requirements.

Society and individuality are inextricably linked in Foucault's work. Over time, he argues, the systematic and pervasive character of training in modern organizations heavily involves the individuality of the disciplined person. "Other-discipline" is imposed by the organization, and comes to work in concert with "self-disciplining" processes, through which individuals strive to become what is expected of them. According to Foucault, these disciplining processes quite simply come to constitute individuality:

Through this micro-economy of a perpetual penalty operates a differentiation that is not one of acts, but of individuals themselves, of their nature, their potentialities, their level or their value. By assessing acts with precision, discipline judges individuals “in truth”; the penalty that it implements is integrated into the cycle of knowledge of individuals. (Ibid., p. 181)

This famously uncompromising view of how organizations constitute individuals contrasts starkly with some strong notions of performance and of the performer within the media industries themselves. Industry practitioners tend to argue that success on screen hinges first and foremost on the performers’ ability to “be themselves” and precisely not to “play a role,” “put on an act,” or otherwise adapt their behavior to the production apparatus. As a Norwegian TV producer puts it: “You can’t *play* a programme host. You have to *be* a programme host” (Ytreberg, 1999, p. 220). In this type of industry account, the necessary natural charisma is often seen to be possessed only by the chosen few, which serves to justify the exclusivity of being a media “personality.” The television writer, performer, and critic Clive James (1983, p. 174) has maintained, with studied arrogance, that “all you have to do on television is be yourself, always provided that you have a self to be.”⁶ In this type of account, some just “have it,” others just don’t.

It seems reasonable to say that the truth about how professionalism in performance comes about may lie between these extremes. However, a media production researcher will want to gain a more precise grasp of the ways in which the individuality of persons is put at stake in media’s production of performance. In conceptual terms, a main contribution from research on media has been the concept of “persona.” Reflecting, in 1956, on the then new television medium, Donald Horton and R. Richard Wohl defined the persona as a “special category of ‘personalities’ whose existence is a function of the media themselves” (Horton & Wohl, 2006, p. 2). The two authors go on to describe the persona as making a similar impression on the television viewer as a friend or family member would do – that is, the impression of someone intimate and familiar. Several decades before the subfield of media production studies existed, Horton and Wohl made the connection between media performance and the requirements of media production: “[The performer] has the peculiar virtue of being standardized according to the ‘formula’ for his character and performance which he and his managers have worked out and embodied in an appropriate ‘production format’” (ibid., p. 35).

Horton and Wohl tended to speak of personae as an artificial construct that bore little resemblance to the performer’s identity and behavior outside media settings. However, a closer look at production practices (which Horton and Wohl did not provide) may suggest that a clear distinction between persona and identity is difficult to draw. This chapter has used the phrase “augmentation of individuality” to describe a gradual process of training and internalization for media performance. Personality augmentation is a process that builds on the performers’ prior identities, basic communicative competencies, and talents. The readying for mediatized performance

involves, then, the cultivation of some personality traits and the suppression of others by production members of staff who work according to the norms and procedures discussed in this chapter. The process is a very concrete and practical one, involving literally innumerable performances, both in simulated training and in actual performance situations. The performer gradually develops and internalizes a repertoire of set phrases, but also a repertoire of appropriate sounds such as brief laughs, poignant pauses, and continuers (e.g., “uh huh”) that help conversation along. There are also set looks, postures, gestures, movements, and mimicry. A working knowledge of complex technologies is required, along with a finely developed ability to micro-manage the body in time and space.

The routine result of this performance work is a persona that is demonstrably different from the individual person who first entered a production setting, although it is related to and it builds on that person. This chapter has emphasized how research helps us understand the nature and extent of such differences. It has also argued that the process of producing media performances involves the exertion of power, and in doing so it has suggested that conflicts are involved. As has been mentioned, media industry discourse often downplays issues of power and conflict, preferring to emphasize how natural charisma can carry the individual through production into successful performance. Some testimonials from within the industry speak to a certain effect of estrangement, however. An example is provided in the 1979 report of Harald Tusberg, a veteran performer in Norwegian TV entertainment, who went to America and was quite literally trained to be authentic:

In the course of a few months we were drilled to walk, sit and gesticulate naturally, to talk and perform communications of the most various kinds in an earnest tone. We were taught to “mean” what we said, to be on guard against false notes, to improvise and play dramatic scenes, to provide witty (planned) remarks in an interview situation [. . .] in short, to behave right in front of a camera and know how a camera must and must not be used. Our individual peculiarities were polished, augmented and incorporated into the setup. It is one of the strangest things I have ever been involved in. (Cited in Ytreberg, 2000, p. 47)

Tusberg’s insightful testimony to the augmentation of individuality reminds us of just how strange and paradoxical the production of media performances is. That strangeness has to do with the need to carefully plan what we usually think of as unplanned. It certainly speaks of extensive changes that can be felt by the performer as affecting the sense of self, although in a somewhat unresolved way. The references to “learning to walk” and being “taught to ‘mean’” seems to speak of an experience whose realness is hard to gauge but that is still felt as being strongly affective. Finally, by focusing on the element of paradox and estrangement, the citation from Tusberg reminds us that the logic of training for making a performance seem real and natural is an organizational, not an individual one. A strong link exists between this pervasive and peculiar process of individual transformation, the affordances of media

technologies, and the requirements of modern media organizations. That link lies at the heart of the study of how media performances are produced.

NOTES

- 1 Goffman's key text is *The Presentation of Self in Everyday Life*, published in 1959. Around this time, related arguments about the foundational importance of performance were made in several academic fields. In rhetoric, Kenneth Burke (1969) developed the concept of "dramatism" as a strategic use of language in social circumstances. In 1955 J. L. Austin presented his theory of the "performative" aspect of language (Austin, 1975). His argument that language is not just a means of representation but also a mode of "doing" has been extended to a number of fields. The performative approach has powerfully informed feminist scholarship (see Butler, 1990) and is central to the cross-disciplinary field of performance studies (for an overview of these connections, see Carlson, 2004).
- 2 This tendency has been much commented on by media researchers, perhaps most famously in three dedicated issues of *Journal of Communication* (1983, 1993a, 1993b).
- 3 At roughly the same point in time, Scannell (1991, p. 11) argued that "all broadcast output is [. . .] a self-conscious, self-reflexive *performance* produced for audiences that are situated elsewhere."
- 4 The following section builds on an interpretation of Goffman's work that has been presented by me in greater detail elsewhere (Ytreberg, 2002, 2010). On this interpretation, his late essay "Radio Talk" (Goffman, 1981b) is a key text in terms of contributing both to media studies and to media and communication theory.
- 5 See also Lundell (2009). A more restrictive use of the concept of scripting can be found in Paddy Scannell's (2003) historical analysis of the management of liveness in British radio. Here scripted talk is contrasted with talk that is live and unscripted.
- 6 Critical discussions of persona and authenticity can be found among others in Dyer (1987), Gledhill (1991), and Tolson (2001).

Imagination and Censorship, Fiction and Reality

Producing a Telenovela in a Time of Political Crisis

Carolina Acosta-Alzuru

ABSTRACT

Telenovelas seem an unlikely arena for political discourse. In 2003–2004 the Venezuelan telenovela *Cosita Rica* aired, in the middle of the country's political crisis and its deep polarization around the figure of President Hugo Chávez. In addition to the usual love stories, *Cosita Rica* included characters who were metaphors of the protagonists on the political scene (one character's story was an allegory for Chávez), plots that reflected the embedding of politics in Venezuelans' everyday life, and a storyline that mirrored the presidential recall referendum of August 2004. This chapter examines how *Cosita Rica* was produced in a time of political turmoil. It is an open window into the life span of telenovela production; through it we are able to observe the writing and the mise en scène processes and how the commercial demands of the genre, the audience's readings, the comments of the entertainment press, and the government's censorship played a fundamental role in *Cosita Rica*'s production.

Telenovelas, long considered by some to be “the most watched television genre in the world” (McAnany & La Pastina, 1994), are melodramatic serials that focus on a central story of heterosexual love plagued with misunderstandings and obstacles. These melodramas seem an unlikely arena for political discourse. However, political commentary has been present in several Brazilian telenovelas (La Pastina, 2004; Porto, 1998, 2005; Straubhaar, 1988), and in Venezuela’s *Por estas calles* (*On These Streets*) (Hyppolite, 2000; Márquez, 1999).

In 2003–2004 the Venezuelan telenovela *Cosita Rica* took the stage, in the middle of the country’s political crisis and deep polarization around the controversial figure of President Hugo Chávez. *Cosita Rica* both straddled and blurred the line between fact and fiction through its complex and realistic characters – some of them allegories of political personalities (including Chávez) – and through its multiple plots framed by Venezuela’s political and socioeconomic crises. The telenovela was broadcast in the space of 11 months (September 30, 2003 to August 30, 2004), which included the difficult period that led to the presidential recall referendum of August 2004 and the referendum itself. Simultaneously mirroring and criticizing reality, *Cosita Rica* achieved high ratings despite the audience’s political polarization.

This chapter examines how *Cosita Rica* was produced in a time of national political turmoil. My study is a contribution to media production scholarship because, in a media industry characterized by secrecy, it opens a window into the lifespan of telenovela production. Through this window we are able to observe the writing, staging, and acting processes in the context of commercial demands for high ratings, the audience’s responses to the program, the comments of the entertainment press, and the government’s censorship rules. All of these elements played a fundamental role in the production of *Cosita Rica*.

Theoretical Framework and Methods

Even though there is still a shortage of cultural studies of media industries in the US, this research area has been growing at a fairly steady pace in the last years (see Mayer, Banks, & Caldwell, 2009). Forerunners in this tradition, such as Todd Gitlin’s (1983) *Inside Prime Time* and Julie D’Acci’s (1994) *Defining Women*, embrace a broad conception of culture as a “site of social differences and struggles” (Johnson, 1986/1987, p. 39). For Richard Johnson, cultural studies is a project that stresses lived experience, legitimizes popular culture as a valid research topic, and focuses on conflicts over meaning in order to “to abstract, describe and reconstitute in concrete studies the social forms through which human beings ‘live’, become conscious and sustain themselves subjectively” (p. 45). Several theorists have tried to model the project to this end: Stuart Hall (1980); Johnson himself (1986/1987); du Gay, Hall, MacKay, and Negus (1997); and D’Acci (2004).¹ All of them include production as an essential element in the study of media and culture.

However, a cursory glance at the cultural studies literature shows a disparity between the number of studies that focus on media production and the amount of research that examines media texts and/or audiences. In general, scholars show a marked preference for the “decoding” aspects of the communication process, while the “encoding” side seems somewhat neglected (as argued in D’Acci, 2004; Kellner, 1995; Levine, 2001; Ytreberg, 2000), or treated as its opposite (MacKay, 1997). This shortage of cultural studies of media production is the result of several factors. First, scholars often choose to study reception rather than production because there is a generalized perception that it is not easy to gain access to media production sites and personnel. Second, D’Acci (2004) argues that the seminal collection *Cultural Studies* (Grossberg, Nelson, & Treichler, 1992) contributed to American cultural studies’ move toward text-centered approaches and foci. This focus, writes Douglas Kellner, helped produce an imaginary divide between cultural studies and political economy, even though

[i]nserting texts into the system of culture within which they are produced and distributed can help elucidate features and effects of the texts that textual analysis alone might miss or downplay. Rather than being antithetical approaches to culture, political economy can actually contribute to textual analysis and critique. (Kellner, 1995, p. 6)

Although I do not disagree with Kellner, I would add that, in order to study the telenovela industry, we must also study processes of media production as cultural phenomena. Beyond economic relations and organizational structures, the processes themselves are “assemblages of meaningful practices that construct certain ways for people to conceive of and conduct themselves in an organizational context” (du Gay, 1997, p. 7). Cultural studies of production assume that media and culture are inextricably linked, since “culture is concerned with the production and the exchange of meanings – the ‘giving and taking of meaning’ – between the members of a society or group” (Hall, 1997, p. 2). Telenovelas demonstrate these exchanges of meaning par excellence. There is constant negotiation between the writers, the director, the production team, the actors, the audience, and the institutional staff that participates in the social formation of the genre. As Jesús Martín-Barbero (1993) argues, the telenovela is a site of “mediations” between production, reception, and culture. The genre thus offers a perfect example of how production and consumption are deeply articulated (Quiroz, 1993).

My own cultural study of the production of *Cosita Rica* is organized largely around the “circuit of culture” model (du Gay et al., 1997) and intends to show how meaning is created and negotiated through processes of production, representation, identity, consumption, and regulation (see Figure 16.1). Each of these processes reveals how the meanings associated with the telenovela are produced, negotiated, and contested. Each one informs the cultural study of production in a more complete way. Hence I studied production processes through 40 hours of individual interviews with *Cosita Rica*’s actors, directors, and producers, and through 30 hours of interviews with head writer Leonardo Padrón. I supplemented these interviews with 200 hours of participant observation on the production set of the telenovela and by watching several episodes with Padrón, observing his reactions. Representation and identity processes

Figure 16.1 Study theory and methods (based on du Gay, Hall, MacKay, & Negus, 1997 and their concept of the circuit of culture).

were examined through a textual analysis of the telenovela's 245 episodes. I further studied identity and consumption processes via 40 individual and group audience interviews, open-ended email questionnaires, and sustained observation of Internet message boards devoted to *Cosita Rica*. These gave me insights into the class and political differences between the various audiences of the telenovela. Finally, I looked at regulation processes by interviewing entertainment reporters and analyzing the extensive press coverage (778 news stories) of national current events and the political implications of *Cosita Rica*. Therefore, although this chapter focuses on the production of the telenovela, the circuit of culture reminds us that production processes are linked to representation, identity, consumption, and regulation.

Some scholars have criticized circuit models for being reductionist and for limiting the way we approach the study of cultural products (see Grossberg, 1997); but I agree with D'Acci's response to this criticism:

A circuit model doesn't hawk a formulaic approach to TV studies; rather it underscores that we cannot start from ground zero each time we embark on a new project, and that explicitly working from the scholarship of the past (scholarship that has contingently delineated and analyzed various dimensions of production, reception, cultural artifacts, and socio-historical contexts) is the best way to structure our current inquiries and our pedagogical practice. (D'Acci, 2004, p. 431)

Context: Reality, Crisis, and Television

Venezuela's Political Crisis

On February 4, 1992, Venezuelans woke up to the surprising news that an attempted coup was in progress. The country, deemed as Latin America's most stable democracy

at the time (Blanco, 2002), had not experienced a similar event since 1958, when the last dictator, Marcos Pérez Jiménez, had been deposed. The attempt was short lived. By the end of the day the insurgents had surrendered, then President Carlos Andrés Pérez was back in his office at Miraflores Palace, and the captured leader of the coup appeared on national television – a sign that the government was again in control. A paratrooper with the rank of lieutenant, Hugo Chávez, looked with aplomb at the camera in front of him as he serenely accepted sole responsibility for the coup's inception and failure. Chávez asked his followers to depose their weapons and surrender, since their goals could not be achieved *por ahora* (for the time being). This *por ahora* television moment changed the fate both of Chávez and of Venezuela (Villegas Poljak, 2002).

Chávez became president of Venezuela in a landslide election in 1998. Soon after, the party system suffered a severe breakdown as he drafted a new constitution and reinvented institutions to further his left-leaning Bolivarian Revolution. Four years later political polarization settled in Venezuela, tainting and pervading all aspects of political, social, economic, and cultural life. Chávez is a messiah for his supporters and a devil for his opponents. He is adored and feared. His supporters allege that the opposition has not allowed him to govern. Opponents argue that he is an incompetent autocrat.

In April 2002, after massive street protests against his government, Chávez was briefly toppled in a business-organized military coup, only to be brought back to power 48 hours later by the military. The return to power followed the mobilization of Chávez supporters – *chavistas* – who clamored in the streets of Caracas for their president's return. In December of the same year the opposition, structured under the umbrella organization Coordinadora Democrática, orchestrated a two-month strike that embraced the oil industry. This strategy proved to be a huge miscalculation. Chávez survived the work stoppage and fired the oil industry employees who had participated in it. The economy suffered a severe blow. Exchange controls were enacted, many businesses closed and unemployment figures rose to new heights, as the economy contracted by 29 percent (Forero, 2003).

After the failed strike, the opposition tried a legal alternative: to activate Statute 72 of the constitution, which allows for a mid-term recall referendum of the president. (In other words it allows voters to remove their president from office before the expiration of the presidential term.) The thorny path to the referendum began in November 2003, with a petition drive to gather the necessary number of signatures to request the referendum. Three months later the National Council of Elections (CNE, which stands for Consejo Nacional Electoral) deemed 1.3 million of these signatures "invalid"; street violence ensued. Then the CNE implemented a process through which the invalid signatures could be "repaired." Finally, in June 2004 the presidential recall referendum process was activated, much to the opposition's delight.

The historic referendum took place on August 15, 2004 after a short but intense political campaign, which was plagued by mutual accusations of abuse and deceit. Chávez stayed in power. His supporters and opponents stayed in their respective

ideological camps. The polarization created then in Venezuelan politics and society persists until today.

Chávez and the Media

From the beginning of the crisis, the Venezuelan mass media played a crucial role in this story. Chávez entered the political stage through television. As a presidential candidate, he was supported by almost all media owners and conglomerates (Hawkins, 2003). However, as business, professional, and elite circles became increasingly disenchanted with the new president, they started fearing the effects of the Bolivarian Revolution. The honeymoon ended and the tone in the media changed gradually, but steadily. In his weekly allocution to the nation, “Aló, Presidente” (“Hello, President”), Chávez repeatedly lashed out at privately owned media. He once called media moguls “horsemen of the Apocalypse” and asked the Venezuelan people to distrust them. By the time of the 2002 coup, the private media were unequivocally opposed to Chávez and had assumed an overt political role.

In June 2003, when the first episodes of *Cosita Rica* were being written, relations between the government and privately owned media were extremely contentious. The latter were in critical financial straits due to the national strike. Their content was unmistakably oppositional. Out of fear of the wrath of *chavistas*, print media offices and broadcast stations were heavily guarded. Reporters wore bullet-proof vests and other anti-riot gear on a daily basis. There were documented cases of threats and physical violence against journalists, and even against entertainers (Tremamunno, 2002). The president appeared regularly on *cadenas* – mandatory public radio and television broadcasts.² During these sessions he derided all private media and threatened to control their content.

Polarization and Telenovelas

Venezuela is a major player in the international telenovela market (Mato, 2005). In the last decade, the Venezuelan telenovela industry has both struggled with and been shaped by the internal political forces of polarization, government-media belligerence, and media regulations that have characterized the presidential terms of Hugo Chávez. Two private television networks – RCTV (Radio Caracas Televisión, owned by the Phelps-Granier family) and Venevisión (owned by the Cisneros family) – are Venezuela’s main telenovela producers and exporters. For the last 50 years they have battled with each other fiercely, in a ratings war that has defined Venezuelan television. The latter has also been marked by the changing relationship between these private networks and the Chávez government. *Cosita Rica*’s production took place in this defining context.

Telenovelas have a stronghold on Venezuela’s prime-time television. Many Venezuelan telenovelas follow the traditional format of *la telenovela rosa* – a love story

about a heterosexual couple in which both partners have to overcome obstacles and intrigues in order to achieve happiness together. The two main characters usually come from different socioeconomic backgrounds; therefore their love story is also a story about socioeconomic advancement. Simplistic, one-dimensional, Manichaeian characters are linked in a main storyline, in which love always wins over evil (Cabrujas, 2002). In contrast, telenovelas *de ruptura* break with this traditional format, as they include social and cultural issues taken from Latin American reality. These telenovelas present complex characters, which are both ambiguous and unpredictable, and their storylines combine personal and social problems in a narrative fiction that attempts to chronicle and critique social actuality, speaking to the audience in terms of a shared reality (Martín-Barbero & Rey, 1999). *Cosita Rica* belongs in this latter category.

***Cosita Rica's Production*³**

It is almost impossible to identify the precise moment in which a telenovela begins to be conceptualized. The creative spark occurs in an imperceptible place in the author's brain (or heart); it is the result of his experiences and talent, and it becomes eventually the ideas that will shape the story. It is far easier to pinpoint the event that leads to the long-term business deal that places a telenovela on the screen.

Cosita Rica's author is the Venezuelan poet and writer Leonardo Padrón. In his case, the creative trigger for his many telenovelas has usually been the city of Caracas and the many characters that inhabit the streets of this fascinating, glamorous, and dangerous metropolis, which is also home to 25% of the Venezuelan population. *Cosita Rica* began like many business deals with a lunch meeting. Padrón's trajectory as an experienced and successful telenovela writer meant that he did not have to compete with other authors to capture the attention of network executives.

Over that lunch, Padrón explained the general concept he had in mind, the characteristics of the main protagonists and their love story, and outlined some of the subplots. The author's thesis for *Cosita Rica* consisted of two stories: "The tale of an immense love and the story of the lack of affection between the political extremes in Venezuela" (Leonardo Padrón, June 18, 2003). His first audience for this story was the network's president, its vice-president, and the person in charge of *dramáticos* (dramas). These network executives liked Padrón's proposal. The conversation then veered from general ideas to particular deadlines – when to turn in the first scripts, when to begin shooting, when to go on the air – and to other particulars: set locations, names of possible protagonists, cast members, and the executive producer and general director who would realize the scripts. Padrón got the green light to start the project of putting his ideas into practice.

Telenovelas, much like soap operas, are made to fit existing talent pools and tight budgets. As he designed characters and storylines, Padrón imagined who would be the best actor for each role. The network negotiated with those artists and their

agents. Once Padrón had confirmation that an actor/actress was on board, he would tailor the character specifically for that person. Meanwhile executive producer Consuelo Delgado and general director César Bolívar explored possible locations for the story in *Cosita Rica*. The budget of a Venezuelan telenovela is considerably lower than that of its Brazilian and Mexican counterparts.⁴ Therefore Delgado and Bolívar had to be creative about choosing locations. For example, all the scenes scripted for a college coffee shop were actually videotaped in the network cafeteria. Gradually *Cosita Rica* acquired its eventual shape. Actors signed their contracts and met with Padrón to talk about their characters, and a small number of episodes were written. In August 2003 production began. In September Venevisión broadcast the first promotions. Finally, on September 30, *Cosita Rica* entered the ratings battle.

How were the writer's ideas transformed into episodes that aired at 9 p.m. every Monday to Saturday? With the exception of Sundays, Padrón and his team of three writers (the *dialoguistas*) wrote at least one episode of the telenovela every day. The time span between each finished episode and its broadcast was originally two weeks in September 2003, but this process shortened to three or four days as the telenovela's finale approached. This is the main reason why telenovela writers have no time to rest. They absolutely must generate one episode per day, in an inexorable routine:

It's an overwhelming creative system. [. . .] Your inspiration must be on a schedule. You have to create a story during nine months that seem to last forever. You write a pile of 12,000 pages, 5,500 scenes, and 200 hours of dramatic tension. [. . .] You can't wait for the arrival of the muse. You must wake her up and bring her to work on time. (Padrón, 2002, p. 51)

Cosita Rica's writing process lasted over one year and was not limited to "office hours." Very early each morning, Padrón outlined (*diagramaba*) the next episode by creating a list of scenes. This is a delicate process. It requires a clear sense of dramatic structure and of the audience's tastes regarding the storyline and the characters. In a good episode outline (*diagra*), the writer moves the story from one cliffhanger to the next and creates linkages, so that the story holds the audience's attention without losing sight of the characters' essential traits. Padrón divided the scenes among his writers, saving for himself the ones that were key to *Cosita Rica's* argument and dramatic structure. Several hours later, when all the scenes had been written, Padrón proceeded to assemble, revise, and polish each episode, taking particular care of his "left-hand margin" notes for the technical crew and cast members in each shoot. Throughout this process he consulted with his writers and with Delgado. Shortly before dusk Padrón emailed the definitive version of the episode, approximately 40–50 pages with 25–30 scenes, to Delgado.

In her capacity as an executive producer, Delgado studied the episodes with the eyes of the person in charge of "making the writer's ideas and dreams come true" (Consuelo Delgado: June 11, 2003). For her, each episode was a long list of props, sets, talent, and equipment requirements. General producer Carolina De Jacovo then converted each script into the shooting schedule – *la pauta* – a daily timetable

organized by scenes, which governs each studio and shooting location and details everything needed: sets, props, actors, director, and production assistants. Script and *pauta* were then copied and given to every single person involved in the production. Actors usually highlighted their lines as they learned them, and they quickly decided on a strategy for their scene(s).⁵ Personnel in the departments that handled props, sets, and wardrobe also worked to be ready for the upcoming shooting schedule, which began very early each morning and ended late at night on most days.

After all the scenes in an episode were videotaped, the episode itself went to the editor's booth, then to the music department, and finally to the post-production department, where it was finalized and promotional previews were prepared.⁶ Meanwhile Padrón stayed on top of as many production details as he could manage. He analyzed, for example, the promotional calls and argued for a number of commercial breaks that would not weaken the dramatic structure of his story. He also worried that President Chávez would interrupt the broadcast with one of his many *cadenas* and carefully examined the ratings, trying to figure out the recipe for staying on top without betraying his *telenovela*'s essence. At home, Padrón watched the final version of his text on his television screen. He focused on the unavoidable gap between the script and the production. He analyzed the actors' performances, which became a frequent source of inspiration. Before going to bed he would work a bit more: "After I watch the episode, I usually pre-outline the *diagra* I will work with the next day" (Leonardo Padrón: April 27, 2004). And that is how each day in the lifespan of *Cosita Rica* ended: with a glimpse of what would come the next day.

***Cosita Rica's* Flight**

Padrón frequently compared the daily struggle of writing and producing a telenovela with flying an airplane on a very long flight. I use the same metaphor to describe some of the key moments in *Cosita Rica*'s journey, which will illustrate the everyday life span of a telenovela from a production standpoint, without losing sight of the articulations with representation, identity, consumption, and regulation.

Like an aircraft, a telenovela must take off with enough power to reach cruise altitude and speed in an adequate amount of time. It is also essential to keep the plane on the air through storms and turbulence until it is time to land softly. Ratings and shares, which are "God and currency" for any commercial television business, determine the duration of the flight.

September 30, 2003–March 2004: Takeoff and Flying at Cruise Altitude in a Turbulent Country

On the evening of September 30, 2003 *Cosita Rica* took off. And, even though network Venevisión had been consistently losing the prime-time ratings war for the past two

years, it took *Cosita Rica* only a couple of weeks to own the first place. The audience enjoyed the telenovela's balanced mix of love, melodrama, reality, humor, and political commentary. By the end of October *Cosita Rica* was flying at cruise speed and altitude. Its main competitor, RCTV's *La Invasora*, had been definitely relegated to second place in the audience's preference. The entertainment press covered and commented on *Cosita Rica* extensively.⁷ Padrón, his writers, the cast, and the production team worked feverishly without major interruptions or problems. And by February, the network's decision makers, ecstatic with the telenovela's success, asked Padrón to extend it from the planned 180 episodes to 240.⁸ Since the writer felt his story had still many possible developments, Padrón agreed to the extension, while production anticipated the continuation of a smooth flight.

In contrast, Venezuela was increasingly agitated as Chávez's opponents gathered the necessary number of signatures to trigger a constitution-based recall referendum of the president. By the end of February 2004, the National Council of Elections announced that 1.3 million of the collected signatures were invalid; this triggered a week of violent street protests in Caracas, which were aggressively squelched by the National Guard and kept people away from their work places. Production stopped that week, and it was necessary to broadcast reruns for several days. When the telenovela returned during the first week of March, the episode included a monologue by the teenage character Nixon. He was the story's occasional narrator, representing the voice of young Venezuelans who face an uncertain future in a polarized country. In a voice-over accompanied by real images of the street protests and by the National Guard's ensuing repression, Nixon said:

I'm very sad because of my country. Venezuela used to resemble the word happiness. But now everything is different. There is fire in the streets. People are shooting each other. I can't feel the breeze from the *Avila* because oxygen now stings, like eyes itch with tear gas.⁹ Some of my friends' parents have disappeared or are dead. Everyone has a stone in their hand . . . or in their minds. Everyone's angry. One of our teachers told us that this is the way wars begin. I'm very scared, even though my dictionary has words that could help us become the country we once were: democracy, freedom, tolerance. But there's a word I've been searching for and I can't find: peace. I'm 15 years old and I live in the country that grownups built. However, these days nobody is behaving like an adult. Instead, they act like rabid dogs. Is it possible that it's easier to kill ourselves than to respect each other? I'm 15 years old and I want someone to give me back my country. Someone . . . or everyone . . . A country that resembles peace . . . peace . . . please . . . (Episode 113)

In general, audience members for and against the president approved these words, which resonated with their recent experience (Acosta-Alzuru, 2011). Mirroring political reality, however, was not an easy road for Padrón. The audience liked occasional editorializing and enjoyed the use of metaphor, as in the case of the charismatic, verbose, and polarizing character Olegario Pérez, which Padrón wrote as an allegory of President Chávez (ibid.). But, when the telenovela re-created

a notorious and widely reported case of authority and physical abuse by the National Guard (Benzaquen, 2004), my study participants were divided in their appreciation, and not by their political position. Some enjoyed watching the sequence, arguing that it “helped people comment what was happening in the country” (AMELIA, 27). Others thought it was “too much” (ANDREA, 35) and “too similar to the tragic events in the streets” (MONICA, 46). The network received many phone calls from viewers who warned that, if the telenovela was going to become another newscast, they would stop watching it. Such was the nature of the tightrope that *Cosita Rica* walked between reality and fiction, between being a mirror and providing entertainment.

April 2004: A Two-Airplane Race and *los Niños de la Calle*

In April, Venezuelans took a break from political unrest, as the CNE decided to implement a process to “repair” the signatures deemed invalid. The television competition, however, heated up at 9 p.m., when RCTV premiered its new telenovela, *Estrambótica Anastasia*, and won the ratings the next ten days in a row. Padrón had been preparing for the new competition. His strategy was to wait a few days and then to exploit the dramatic conflict of *Cosita Rica*’s favorite story of young love (the *historia de amor juvenil*)¹⁰ (Acosta-Alzuru, 2007); in the story, identical twin sisters separated at birth – one poor, the other rich – fall in love with the same man.

In a plot reminiscent of Mark Twain’s *The Prince and the Pauper*, María Suspiro and Verónica meet for the first time in their early twenties and decide to exchange places. They are opposites, two sides of the same coin:

María Suspiro is war. Verónica is peace. María Suspiro is hyper. Verónica is serene. The first is joyous. The second is melancholic. María Suspiro is intuitive. Verónica is rational. To me they’re both luminous. María Suspiro is the blazing sun of high noon and Verónica is the light of sunset. Neither one is night. (Leonardo Padrón: May 8, 2004)

María Suspiro falls in love with the luxury of her sister’s life, and Verónica falls for her sister’s boyfriend, Cacique, who does not know that his girlfriend is really two different women. As the plot progresses, the relationship between Cacique and Verónica heats up. Their “chemistry” surpasses the television screen. The love triangle is set in such a way that, by the time the public realizes that Cacique is (unknowingly) really in love with Verónica, they already love María Suspiro’s exuberance too.

Ten days after the premiere of *Estrambótica Anastasia*, in a heavily promoted episode, Cacique finds out that María Suspiro has an identical twin sister and that the two women have been exchanging places. Even with a forced 10-minute interruption for Chávez’s allocution, ratings soared to the highest point that *Cosita Rica* would ever achieve. Not even its final episode topped the numbers of that pivotal evening. *Cosita Rica* regained its first place. The writer’s strategy had worked.

The fact is that when a story has broadcast 150 episodes, the audience has its favorite characters and stories. It would be senseless to navigate against the audience's likes and dislikes. [. . .] When the telenovela faces a strong rival, I must underscore *Cosita Rica's* strengths. This is what I'm doing with Cacique and the twins, and it's working. (Leonardo Padrón: April 27, 2004)

In April, in addition to the fierce ratings war, *Cosita Rica's* production had an incident with the Chávez government, which was related to a subplot focused on the high number of abandoned and runaway children and adolescents who live in the streets. Known as *los niños de la calle* ("street children"), these youngsters have dropped out of school and do not count on family support. They survive among the filth and insecurity of Venezuela's largest cities as beggars and/or petty thieves (Márquez, 1999).¹¹

Street children have a presence in *Cosita Rica* in a plot in which 15-year-old Nixon, who lives in one of the poorest sectors of the city, meets a group of *niños de la calle*. Despite their aggressive and seemingly disdainful attitude, their physical and emotional hunger gives away their needs and disturbs Nixon in profound ways, as these youngsters place him in the unusual situation of being the most "privileged" in the group. Nixon's mother, an unemployed, single parent, gets involved and organizes fundraisers on the street children's behalf. In this way Nixon and his mother become the conscience that reminds the viewers that, in spite of these children's ubiquitous presence in the streets, it is easy to become desensitized to their plight and to forget them, even when we are seemingly looking at them:

NIXON (VOICE-OVER during the New Year spectacular fireworks in Caracas): Like every year, we were all betting on a great New Year and a country that finally resembles our dreams. [. . .] The only thing that saddened me was to think of how my friends from the streets were doing at that time. I know that at a happy time like New Year's, the whole country forgets their existence. Maybe in this coming year there will be a President that will remember them. Hopefully . . . (Episode 75)

The political overtones of this storyline reached a climax when Nixon and his friends decided to take advantage of a political rally to voice the needs of *los niños de la calle*. Nixon climbs the stage, takes the microphone away from a politician who is delivering a trite speech, and speaks out on behalf of his friends:

NIXON: You would think *los niños de la calle* are dumb and can't speak. I say this because it seems to me nobody is listening to them. Today I speak for them, as if I were one of them. Grownups, don't mention us until you learn to look at us without disgust. The only thing we want is a place that could be called home and something that resembles a school. We don't want to hear any more lies. We don't want to listen to any more unfulfilled promises. (Episode 145)

The network edited Nixon's monologue. In the original script, the youngster also said: "Mr. President, don't mention us anymore in your speeches. Members of the opposition, don't use us in your political propaganda."

The editing of this monologue was the first instance of prior restraint related to *Cosita Rica*. It was caused by an incident that occurred while shooting these scenes. With every permit required by law, the sequence was shot in a quiet street across from the army's social entity, Club de Suboficiales. A few minutes after young actor José Manuel Suárez (who played Nixon) said his lines, Minister of Defense General Jorge Luis García Carneiro arrived at the location:

He was very irritated and upset. First, he kicked one of the guards of the Club de Suboficiales because he had allowed the telenovela to videotape there. Then, he unplugged some of the network's equipment and yelled that if we didn't leave the premises in 30 minutes, he would detain everyone. (Leonardo Padrón: April 17, 2004)

In addition to ordering the editing of the monologue, network executives scolded executive producer Delgado for her choice of location for this sequence and warned Padrón about the political color of this particular plot. This first instance of self-censorship by Venevisión was a sign of alarm and heralded changes in the network's political position.

May 2004: The Electric Storm

In May, Venezuelans opposed to Chávez "repaired" their signatures to recall the president and waited, while the CNE slowly audited and tallied the signatures. In *Cosita Rica* new characters appeared, creating new dramatic plots, solving some of the older ones, and giving the entertainment press more fodder for stories and gossip columns. Padrón worked on ways to return his protagonists – Diego and Paula C. (played by actors Rafael Novoa and Fabiola Colmenares) – to *Cosita Rica*'s center stage. In the ratings competition, the telenovela stayed firmly in first place. In spite of all these positive developments, May was a stormy month for Padrón and for *Cosita Rica*'s female protagonist Colmenares.

Measured in ratings and shares, the emphasis placed on the twins' plot at the end of April had worked successfully. However, the audience felt a bit disoriented, as it perceived that the protagonists' story was now second in importance, a transgression of the telenovela codes. "I feel the protagonists are now in the sideline" (ANA, 49). There was some discomfort among the cast too. One actor told me anonymously: "In this telenovela the protagonist code has been broken. Last Tuesday we won the ratings war with an episode that did not feature the female protagonist at all."

On May 4 an upset Colmenares met with top network executives and threatened to resign unless her character regained the importance of a protagonist. They promised her that they would talk to Padrón. However, the next day, when the network's president and vice-president met with the writer, they did not mention the topic of Colmenares' possible resignation, focusing instead on the successful strategy of elevating the volume to the twins' storyline (Leonardo Padrón: May 5,

2004). Padrón had already written a sequence of episodes focused on the main love story that included protagonist Diego interrupting Paula C.'s wedding with antagonist Olegario.¹² The plot was promising and the production team worked long hours for the mise en scène of these episodes, which were videotaped in a country estate outside Caracas.

Colmenares, however, had already talked to the press. Entertainment reporter Marlene Castillo wrote on May 11:

Fabiola, more depressed and disappointed than upset as she watches her character lose its rank of protagonist, presented her resignation to Venevisión top executives, who did not accept it with the promise of a "reconsideration" that would revalue her role to what it used to be. (Castillo, 2004b, p. 20)

The next day other reporters and gossip columns echoed the news of Colmenares' resignation. But, on May 13, the respected daily *El Nacional* reported that "Padrón denies Fabiola Colmenares' resignation" (Silva, 2004, p. B10). Entertainment reporters who had written about the resignation as a *fait accompli* reacted angrily:

Leonardo Padrón denied Fabiola Colmenares' resignation. It isn't the first, nor is it the last time that this happens. But to deny us when we're supported by the truth bothers us. [. . .] Colmenares DID resign. (Castillo, 2004c, p. 19)

When the promotions for the upcoming wedding episodes were broadcast, the press assumed this development as confirmation that Colmenares had indeed resigned and Padrón had been "scolded" by network executives who were appeasing the actor (Sepulturero, 2004c).

Paula C.'s interrupted wedding with antagonist Olegario produced good ratings, although significantly lower than those of Cacique and the twins.¹³ Venevisión's executives were happy, even though *Cosita Rica*'s distance from RCTV's *Estrambótica Anastasia* gradually decreased when the protagonists were finally together. What mattered was that the Padrón-Colmenares storm seemed to be over without having any effect on the audience's support of *Cosita Rica*.

At the end of the month, however, a gossip column published a note that began a whole new wave of speculations regarding the future of protagonist Paula C. Using the pseudonym "El Sepulturero," a columnist wrote that Padrón was so upset with Colmenares that he was going to introduce in the telenovela a serial killer, played by a Mexican actor, who would murder several characters, including the protagonist (Sepulturero, 2004a). The supposed addition of the "Mexican psychopath" was repeated by at least two media outlets (Castillo, 2004a; Sepulturero, 2004b), even though Padrón flatly denied it.

The writer knew this unfounded rumor could be damaging to his telenovela. He was right. To audience members, the "Mexican psychopath" was the opposite of the

realism they enjoyed and expected in *Cosita Rica*. On the Internet, message boards buzzed with anger (see *Cosita Rica*, n.d.):

LET'S UNITE AND REJECT WHAT'S GOING TO HAPPEN IN *COSITA RICA*!

May 24, 2004

According to the press and to a reliable source, Paula C and Diego will be out of *Cosita Rica* soon. A serial killer will appear and kill a bunch of characters, including them. Let's say NO to this destruction of our beloved telenovela! I hope that Padrón reads these lines one day and realizes that this is the worst thing he could do!!

–Dragoons

LET'S SAVE *COSITA RICA*!

May 27, 2004

Padrón wants to damage the telenovela . . . Nooooo . . . The press says that César Evora and another Mexican actor are going to be part of *Cosita Rica* as a serial killer. How ridiculous!! All *Cosita Rica* Fans must unite and not allow this to happen! We want the telenovela to continue reflecting the country's situation!!

In this way the stormy month ended with Diego and Paula C. recovering their protagonist status, *Cosita Rica* regaining first place, but with diminishing ratings, the press being obsessed with the entrance of a serial killer, and Padrón feeling the first signs of fatigue and facing the last months of his very long telenovela.

June–July 2004: Turbulence

In contrast with the situation in May, when *Cosita Rica*'s ratings were not altered by the electric storm generated by its unhappy protagonist, in June the telenovela encountered turbulence that turned on the warning indicators in the cockpit.

The month did not begin well. *Cosita Rica* lost the ratings in the first two days. The protagonists had been together for a week, and their storyline had lost its dramatic tension. Meanwhile the writer of its main competitor, *Estrambótica Anastasia*, had included a murder/“who'd done it?” plot that attracted viewers. The audience had become impatient with *Cosita Rica*, wanting to be constantly surprised by the telenovela. Acknowledging that the main love story's tension was based mostly on keeping the protagonists apart, Padrón generated a new obstacle for their love: Diego is kidnapped by a Colombian guerilla fighter. The audience gave this plot twist a cold reception, even though it evoked similar events that had shaken Venezuelans in the last decade. Furthermore, because Diego's kidnapping coincided with another storyline in which Patria Mía, a favorite character, gets involved with a drug trafficker, the audience felt that *Cosita Rica* had lost its luminous qualities. Certainly the balance between reality, melodrama, and humor had been altered, and both the ratings and the audience's comments showed the public's displeasure: “They forgot the central idea. Now we have to swallow this modern guerrilla. It's ridiculous. Every time they

show kidnapped Diego, I stand up and do something else. It's boring and totally uninteresting" (MONICA, 46). Here is a post on the message board for the show again (Cosita Rica, n.d.):

PLEASSSSEEEEE

June 21, 2004

Don't you think that since Fabiola Colmenares' temper tantrum the telenovela has changed? It's now such trash. The protagonist kidnapped, Patria Mía with that junkie. Please don't transform the telenovela into something boring and predictable!

–Elsa

Cosita Rica lost on June 18 and barely won the next day. Padrón declared a state of emergency and called a meeting with his writing team.

I think that *Cosita Rica* is suffering from erosion at the same time that its competition has become more interesting. To be honest, I don't think people liked the guerrilla plot. I've heard too many comments of people saying that the telenovela is now too serious and kind of heavy. The emergency indicators are definitely on. (Leonardo Padrón: June 21, 2004)

Decisions were made: add more humor to the script, elevate the volume of the characters and storylines that the audience loved (like the love story between Cacique and Verónica), write a three-month time ellipsis (a jump in time) that would solve/dissolve the plots that were not working, and use the telenovela itself to dispel the annoying rumor about the "Mexican psychopath."¹⁴

In the last week of June, the government-controlled network Venezolana de Televisión (VTV) premiered *Amores de barrio adentro* at 9 p.m. A blatantly pro-Chávez dramatic serial, it changed nothing in the prime-time ratings war because the Venezuelan audience all but ignored it, which suggested that, regardless of their political stance, Venezuelans were not interested in telenovelas that resembled political pamphlets.

Meanwhile, on most days, *Cosita Rica* and *Estrambótica Anastasia* were neck and neck in their quest to win ratings. When July arrived, Padrón made a move that returned his telenovela to the first place. Fictional character Olegario Pérez, like Chávez, the real-life character he evoked, now faced a recall referendum relative to his administration of cosmetics corporation *Emporio Luján*, a metaphor for Venezuela. The audience received this development, plus a refreshing time ellipsis, with pleasure: "*Cosita Rica* is now in an active and dynamic path. It's like they've given it some oxygen, and now it's as attractive as when it first started" (ROSALBA, 42). "I thought it was great that the telenovela skipped those three months. It gave it a new life" (REBECA, 20).

The writers, the cast, and the production team were exhausted, though. They wanted the telenovela to end as soon as possible. In an extremely polarized country, shooting scenes close to the date of the Chávez referendum worried everyone who

worked in *Cosita Rica*. However, their wish that the telenovela would end before August 15, when the historic referendum was due to take place, was not granted.

The Minister of Information and Communication and members of the Comando Maisanta (the government organization in charge of Chávez's referendum-related political campaign) met with Víctor Ferreres, president of Venevisión, and ordered that Olegario's on-screen referendum could not take place before Chávez's. The network had no recourse but to comply. In this meeting the government made clear that they were following *Cosita Rica*'s stories closely and warned Venevisión about using the telenovela for propaganda purposes. Feeling threatened, the network responded by implementing a self-censorship system. Scripts were carefully read by the network's legal department. Dialogues were modified and some scenes were re-taped, which added yet another layer of complexity to the last month of production.

Even with this annoying self-censorship in place, Padrón knew that *Cosita Rica*'s parallel path with reality could not be altered. July ended with *Cosita Rica* in first place and increasing its advantage over its competitor day by day. On the 27th, Venevisión announced *Cosita Rica*'s *etapa final* (final stage) and aired the first promotional broadcast for the telenovela that would substitute it in the 9 p.m. slot.

Venezuelans looked forward to August, when their country's destiny and the fate of the characters that had entertained them for almost a year would be decided.

August 2004: *Cosita Rica*'s Landing

The presidential recall referendum and its consequences marked the month of August. Two weeks before Chávez's referendum, *Zeta*, a political magazine with a clear oppositional stance, veered from a 30-year-old policy of not showing artists or entertainers on its cover and displayed a picture of Olegario with the headline "'Olegario' tá cagao" – "'Olegario' Is Shitting His Pants" – which clearly referred to Chávez.

The parallels between the telenovela and the national political arena were unmistakable. Venezuelans spent most of August 15 in long lines, waiting to vote for or against their president. Actor Carlos Cruz, who played Olegario in the telenovela, also stood in line for many hours to vote. Some passersby from the opposition acted toward him as if he were Chávez: "We're going to revoke you!" "This is your last day in the presidency!" (Carlos Cruz: August 27, 2004). Both political sides were sure they would obtain victory. In the wee hours of the morning of August 16 the CNE announced the president's victory. The opposition cried fraud, while the Organization of American States (OAS) and the Carter Center certified the result. Venezuela was now divided not only between *chavistas* (pro-Chávez) and *antichavistas* (anti-Chávez), but also between satisfied and frustrated Venezuelans.

In *Cosita Rica* it was finally time to prepare the aircraft for landing: resolve plots and decide each character's fate. The line between reality and fiction was further

blurred. The entertainment press mentioned the telenovela on a daily basis, and even the political press speculated about the fate of both Chávez and Olegario, while the audience had come back in mass to watch *Cosita Rica*'s last month: "I like everything that's happening in *Cosita Rica*. I'm enjoying it so very much. Sometimes I want it to end to see what will happen with certain characters. But at other times I don't want it to ever end" (ANDREA, 35).

On August 19, after more than two days of almost non-stop work from the writers, Padrón emailed *Cosita Rica*'s final episode. It consisted of 85 pages and 79 scenes, which ended the telenovela that had put Venevisión back in first place. *Cosita Rica* landed on August 30, exactly 11 months after it had taken off. Olegario, like Chávez, wins his referendum, and his opponents, like those of Chávez, cry fraud. Paula C. and Diego lived happily ever after. So did Cacique and Verónica, while María Suspiro fulfilled her girlhood dream of becoming Miss Venezuela.

Olegario's ending gave Padrón some unpleasant experiences. He received many anonymous text and phone messages calling him "immoral" and suggesting that he had been co-opted by the Chávez government. Throughout *Cosita Rica*'s 11 months the president's opponents had applauded the parallelisms between Olegario and Chávez. However, they were upset when Olegario won his referendum, because they felt that, just as Olegario was a satire of Chávez (and they liked that), now he was legitimizing the president (and they disliked that). These *antichavistas* felt that Padrón, *Cosita Rica*, and Venevisión were deserters in Venezuela's political battle.

The audience enjoyed the final episode, although, for those who opposed the president, "it brought back bad memories from Chávez's referendum" (DANI, 27). Sixteen months after the final episode aired I was still receiving emails from my study participants mentioning *Cosita Rica* as an unforgettable telenovela that had marked them. After its long journey, *Cosita Rica* had finally landed. The pilot and crew could finally say thank you and rest:

I truly believe that *Cosita Rica* will be a memorable chapter in our lives. We achieved a resonance within the audience that surprised us all. Each character became part of Venezuelans' affective imaginary. You, actors, managed to enter the viewers' retinas and furnish their smiles. You became topic and dessert every evening. I want to thank you for giving a piece of your soul to your work. I also want to apologize for the grey scenes, the lukewarm dialogues or the incoherent situations that I may have written. In a journey as long as this one, it was impossible that none of us lose our way, at some point. The important thing is that we've arrived to the end, unbeaten in our quest to make a more dignified television and accompany our country at a historical time of strife. We were the fiction that gave the public laughter, love and reflection. Today I turn off my computer, exhausted and happy, worn out and sad, thankful and taller, older and more human, thanks to you and to this story. Our story. [. . .]

Thank you. As I embrace you I say out loud: thank you.

And my heart stands up and applauds you forever. (Padrón, n.d.)

Conclusion

Those who place their words in the guts of a telenovela know it well: Love without ratings doesn't last.

Barrera Tyszka (2002, p. 65)

The life expectancy of a telenovela is determined by its ratings. "Love without ratings doesn't last" is the tenet of an industry that is often heartless and stubborn in its quest for success. The latter is strictly defined in terms of ratings and shares, which are the currency of the television industry. The quality of a show is never nearly as important as the numbers that measure the audience's choices. From the entertainment press to hardcore telenovela fans, ratings and shares impregnate every aspect related to a telenovela's production and reception.

These numbers also determine the survival of writers in the industry. It is not desirable to have a losing record. And, even though all writers have failures in their trajectory, it is necessary for their permanence in television that these failures are scarce and isolated occurrences. Studying Padrón as he wrote *Cosita Rica* allowed me to observe how he struggled every day with the tension between the commercial requirements of the genre and his own creative and stylistic needs as an author. I witnessed his battle to couple rating and quality in a commercial product that ends up not being his. On occasions, I saw how he succumbed to the strictly commercial parameters of an industry that can be like a sausage factory. I also witnessed how he overcame these factors and showed the best of his creative talent, as his telenovela encouraged the audience to reflect on the country's polarization and on the nature of political leadership.

Studying *Cosita Rica*'s production process also helped me understand the actors' craft/art in an industry that often does not care for real talent. In Venezuela there is an understanding of celebrity that assumes that Venezuelan actors have the lifestyle of the most glamorous of their Hollywood counterparts. In reality, the large majority of actors belong to the middle class. Most of them are not on the networks' payrolls, but are only hired by the telenovela. Hence their jobs are far from being stable sources of income. Furthermore, in a country where the theater and the film are not nearly as developed as television, telenovelas are the actors' main source of living. The actors' survival, like that of telenovela writers, also depends on the success of the melodrama they are working in. And, sometimes, as in the case of Colmenares and the creator, Padrón, the actor's professional achievement (via the character personified) is at odds with the success of the telenovela and of the writer.

Observing every stage and locus of *Cosita Rica*'s production process, I was struck by the fascinating paradoxes of these shows, which are, simultaneously, consumed and disdained in massive amounts. In telenovelas writers, actors, directors, and producers are determined to be artists striving for perfection in a highly commercial genre, riddled with imperfections arising from the industrial pace of production. In

the case of *Cosita Rica*, this paradox was further complicated with the telenovela's political content and context.

Examining *Cosita Rica* allowed me to observe the endless search for an answer to the question that dominates and determines the telenovela genre: What does the audience want? Day after day, all those involved in the writing, production, and decision processes try to answer this question and present their bets regarding the right answer. Day after day, they read in ratings and shares how right or wrong they were and whether their wager was a winning or losing bet. This is a life or death gamble for each telenovela and for the professional continuity of its makers. This industrial process is the key to grasping the articulations between media, culture, and society. For Venezuelans, *Cosita Rica* was entertainment, reflection, and catharsis at a difficult historical juncture. As I witnessed *Cosita Rica*'s flight, I saw first hand the dialogue between television and country, and how creativity was nurtured or restricted by the reality of Venezuela's political moment.

Epilogue

In March 2005, seven months after *Cosita Rica* ended, the Ley de Responsabilidad Social en Radio y Televisión (Law on Social Responsibility in Radio and Television) went into effect. This law, denounced by Human Rights Watch as coercive and stifling of freedom of expression (Human Rights Watch, 2003), imposes severe penalties on media outlets that do not comply with its content regulations. It includes strict rules regarding telenovelas' language and storylines.

In May 2007, alleging that RCTV was a "terrorist" media outlet, President Chávez did not renew the network's 50-year-old airwave concession. Hence RCTV ceased to exist as a commercial network, while TVES (Televisora Venezolana Social), a government station, occupied RCTV's frequency in the spectrum. Since then, Venevisión, the country's only surviving telenovela-producing network, is under severe self-censorship.

Today it is impossible to produce and broadcast in Venezuela a telenovela like *Cosita Rica*.

NOTES

- 1 Briefly, Hall's (1980) "encoding/decoding" model accounted for media producers, texts, and consumers. Johnson described his model as a "circuit" and included production, texts, readings and lived cultures. Du Gay, Hall, MacKay, and Negus (1997) and D'Acci (1994) subsequently included media production, representation, identity, consumption, and regulation in their models for a "circuit of culture."
- 2 "In 1999 there were 62 hours and 27 minutes, in 2000, almost 108 hours, in 2001, 116 hours and 58 minutes. In 2002 the figure dropped to 73 hours, but in 2003 there were

- 165 hours and 35 minutes. Up until July 24, 2004, there were 87.23 hours [of presidential *cadenas*]” (Marcano & Barrera Tyszka, 2004, p. 278; my translation).
- 3 A note about typographical conventions: throughout this chapter, quotations from production participants (writers, actors, producers, and technical crew) will be identified under “participant: interview date.” Audience members’ words will be recorded under “PSEUDONYM, age.” Quotations from Internet message board and chatrooms will appear under the pseudonym “nick” for each participant.
 - 4 At the time, Brazilian telenovelas had a budget of \$100,000–120,000 per episode. In Mexico each episode cost \$60,000–80,000. Venezuelan budgets were \$15,000–30,000 per episode (Mato, 1999, p. 234).
 - 5 For an actor, working in a telenovela is like being in a year-long acting “bootcamp.” Unlike in film or theater, in a telenovela nobody knows ahead of time all the twists and turns of the plot (not to mention how these unknown factors will affect each character). Furthermore, because telenovelas are broadcast on a daily basis and are not governed by seasons (like US TV series), once production starts, there is little time for actors to plan and strategize. Personifying a telenovela character is like knitting a huge sweater in which the writer holds one knitting needle and the actor holds the other one.
 - 6 Because telenovelas occupy prime-time slots, promotions of the upcoming episode are aired throughout the day.
 - 7 The number of news stories focusing on *Cosita Rica* more than tripled those dedicated to *La invasora*.
 - 8 There is no set number of episodes for a telenovela. However, 120 episodes is the standard used in network contracts with writers and actors.
 - 9 The Avila is a mountain that defines life in Caracas.
 - 10 In addition to the main love story, most telenovelas now offer a love story between younger characters. The inclusion of the so-called *historia de amor juvenil* started as an attempt to lure younger audiences to the genre (Espada, 2004). Today these love stories of younger lovers are a staple of the genre.
 - 11 According to UNICEF, the number of *niños de la calle* in Venezuela had increased from 2,500 in 1992 to more than 8,000 in 2003, the year *Cosita Rica* was broadcast (De Venanzi & Hobaica, 2003).
 - 12 I use here the Venezuelan convention of referring to the character by his/her first name.
 - 13 The episode in which Cacique discovered the twins’ existence won 15.4 to 6.1 ratings points. On the night when Paula C.’s wedding was interrupted, *Cosita Rica* won 11.6 to 7.0.
 - 14 In three different episodes, when a character mentioned her/his concern about the existence of the Mexican psychopath, another character replied with undeniable scorn: “There’s no Mexican psychopath! Don’t believe everything you read in the press!” After that, the press stopped mentioning the “*psicópata mexicano*.”

Distributed Creativity in Film and Television

Three Case Studies of Networked Production Labor

John T. Caldwell, M. J. Clarke, Erin Hill,
and Eric Vanstrom

ABSTRACT

This chapter will examine the systematic ways in which cultures of facilitation and “distributed creation” fuel Hollywood corporate, labor, and creative practices. The study brings together three substantial but largely invisible, ignored, or camouflaged sectors of Hollywood that are fundamentally important in the creation of film/TV screen content, yet have received scant attention from either scholars or critics: assistanting, marketing research rituals, and content development outsourcing. All three areas help constitute the industry’s production infrastructure, which can be thought of, alternately, as interpersonal and inter-organizational networks through which the task of content creation is “distributed,” or as “catalytic” sites of mediation and negotiation that are subsequently erased by above-the-line creative executives: these habitually hijack credit for Hollywood’s content creation on the basis of professional postures of managerial or personal exceptionalism.

Introduction

John T. Caldwell

The genius of the Hollywood production system for film and television lies in two interrelated workaday habits. The system excels at effectively “distributing creativity” to teams of artists and contract workers, even as it “harvests” and manages this collective idea churning into months-long and complex narratives for series television and for blockbuster film franchises. This chapter examines the ways in which the industry distributes, harvests, and monetizes creative work; and it does so through three case studies of very different industry sectors. These studies all underscore that “production” actually includes wide-ranging work practices that go far beyond the traditional stereotypes of location shoots and sound-stages. They also raise questions about the collective nature of creative work, and how this group work differs up and down the production food chain – from “below-the-line” craft workers to “off-the-set” support personnel and to “above-the-line” executives. These cases challenge production studies to think beyond physical production *per se* and to understand better how the distances, and the extent of interaction, between artists and executives are managed and how the social bonds between workers impact the film and television we experience on a daily basis.

Before considering work “outside” – or off the set – two examples illustrate “distributed, then harvested” creativity in places traditionally viewed as being “inside” creative spaces. First, distributed creativity in the prime-time writers’ room – where writer/producer teams create narratives through real-time pitching, debating, and negotiating story elements – can alternately function like brainstorming R&D (research and development), like group family therapy, or like a deadlocked jury room. This work environment has proven essential in creating large multi-episode story worlds, in part because the dozen or so writers present in a room learn their craft over time, in a system of graduated assisting, apprenticing, mentoring, and producing. Long-term teaching and modeling unfold here – that is, along with screen-writing and producing – which makes them model activities for corporate multitasking. The room survives industry-wide because successful executives have learned to monitor the chaos selectively, to glean ideas efficiently, and to channel the brainstorming economically so as to create focused high-concept screen content.

Physical production provides a second example, since traditional camera crews “on the set” also work in “teams.” Yet, unlike writers’ rooms, these crews are organized around a quasi-medieval craft-mentoring system and are managed in a military-style, hierarchical, chain-of-command scheme. Both of these disciplining measures – distributed creativity and physical production – are supported by the job-threatened IATSE (International Alliance of Theatrical Stage Employees) unions and by management’s cost-obsessed executives, who do not want crews to “invent,” but only to “render” their expensive and risky investments. The “speak only if spoken to” rules implicit in a camera crew differ dramatically from the constant, effusive “who can

speak the loudest” group speculation that characterizes the writers’ room. If camera crews still follow a classical Taylorist/Fordist approach to distributing production work (segmented and assigned down the line, in an assembly-line fashion), then writers’ rooms follow a post-Fordist/psychotherapeutic model of simultaneity (creativity as an encounter group).

Both examples underscore why research on creativity and constraints should consider legal, economic, unionist, historical, and institutional factors – not just organizational structures or interpersonal interactions – in order fully to understand a specific culture or subculture of production. The following three case studies of collective work do just that. Each is a short essay that challenges us to compare insights gleaned from fieldwork research in Los Angeles to dominant trade discourses and popular depictions of production. Each case also asks us to think about creative work in production far beyond the on-the-set confines of the soundstage or the writers’ room, paying heed to the legions of off-the-set support workers once thought to be “ancillary.” Hierarchies, “teamwork,” and “sharing” – sometimes in tortured manifestations – are as important for production off the set as they are for production on the set. Finally, these essays prompt us to think about where creative labor actually resides now – in the digital, post-network era. Each case shows how distributed, then harvested creativity is no longer confined to the bounded worlds of crews and rooms. Now, in the age of online media and economic recession, collective creative work melds indistinguishably with “outsourcing” (Clarke), with “dues-paying” (Hill), and with “crowd-sourcing” (Vanstrom).

In the first essay M. J. Clarke contrasts popular trade theories with his industrial research on the outsourced creative workers who produce Hollywood’s newly branded ancillary content for “tentpole” mega-shows like *Lost*. In showing how studios now manage and monetize “infrequent contact” with increasingly anonymous production artists, he turns Chris Anderson’s “long tail” theory on its head, showing how the current reorganization of screen content mirrors a major reorganization of creative workers. In the second case study Erin Hill compares “insider” blogosphere communications to her own fieldwork with producers’ and agents’ assistants, painting the picture of an unruly and poorly paid office workforce, whose gendered labor and contention is only barely managed through the habitual mantra of deferred career gratification and through a culture of “dues-paying.” She is particularly good at suggesting historical reasons for the industrialization of “emotional labor” and how a culture of “suffering for *entrée*” helps keep Hollywood’s lowest paying jobs filled with an endless supply of cheap labor. Unlike Clarke’s disaggregated artists, Hill’s assistants are *not* far from the centers of power and are instrumental in creation; yet they remain invisible nevertheless. Finally, Eric Vanstrom shows how ostensibly unauthorized fan activities “outside” of the studios, in online start-ups like the “Hollywood Stock Exchange” (which cultivates sophisticated management knowledge about the film industry), have actually become more effective than “inside” studio marketing research in predicting a film’s commercial success or failure. Vanstrom’s picture – of “fans” defined through their “executive” affinities, and of box-

office competencies freely fueling Hollywood's futures markets – undercuts two scholarly orthodoxies: that fans are unauthorized subjects recreationally hijacking screen content for personal ends; and that fans are subjugated by Hollywood's market research and media's "surveillance" regime.

All three case studies show just how calculated and problematic the practices of redistributing non-union work have become to the new Hollywood. Consider that Clarke's conglomerates obsess on *reconnecting* ancillary content to mother brands by simultaneously *disconnecting* and outsourcing production work. In turn, habitual industry recriminations against the lowest paid workers transform Hill's vast *collective* of producers' assistants into suffering *individuals* – career ascetics who serve their vocational sentences. Finally, the industry easily converts the unruly "distributed intelligence" in Vanstrom's fan *hive-sourcing* into market research *outsourcing*, even as it freely hijacks and gathers fan intelligence-sharing into its marketing and business plans. Therefore all three cases involve pushing labor (its entitlements, health plans, and authorship aspirations) farther away from corporate centers, even as management ranges more widely to harvest creative ideas and intellectual property (IP) back for its screens. This trend may spur us to research distributed-harvested creativity in the executive suites and in finance and development meetings. After all, at this rate, executive teams may be among the only "workers" left harvesting ideas on the studio lot.

Aggregating Content/Disaggregating Labor in Tentpole TV

M. J. Clarke

Depending on the expert you cite, network television is either drawing its dying breath or slowly mutating into something radically new. Regardless of the description one chooses, change in the organization of work around many fictional television programs is evident. In the following pages my purpose is two-fold: first, I wish to show how network television producers in the US are currently experimenting with distributed organizational forms that are meant to capitalize on a postdigital landscape by more aggressively incorporating what Henry Jenkins (2006) has called transmedia; second, I intend to demonstrate the problems and provisional solutions raised by this important shift in creative management and its exploitation of loose social bonds. This section examines a specific mode of entertainment production, which distributes creative roles to a number of workers (a sort of limited crowd-sourcing) and across a number of platforms – a technique that I call, echoing the event-building and image-saturating strategies of the contemporary film, "tentpole" TV. What follows will then suggest some of the difficulties encountered by traditional television makers in their efforts to disperse creative responsibilities, as well as several common solutions favored by these same workers and producers of affiliated transmedia. In attempting to sketch a portrait of tentpole TV production, my section

draws on industrial and popular press representations of the world of television workers, contrasting such representations to the conclusions drawn from a series of interviews with transmedia professionals.

In early 2007, *Wired* editor and television doomsayer Chris Anderson was the keynote speaker at the annual National Association of Television Program Executives (NATPE) conference, where he promptly informed the entire television industry: “you don’t have megahits [. . .] the blockbuster is a diminishing part of the market as demand is distributed on a vast amount of products” (Nordyke, 2007). Here Anderson was drawing on his hugely influential book *The Long Tail* (2006), in which he discusses a “supply chain revolution” brought about by innovations in digital storage and distribution: this revolution creates an infinite amount of shelf space and an infinite range of demand, suggesting that nearly all the goods, no matter how obscure, will sell at least a few units when brought to this virtual market. The thesis of the book is that the mass of these nearly infinite niches – what Anderson calls the “long tail” – outnumbers the volume of singular mainstream hits. Thus thousands of video podcasts taken collectively do better numbers than CSI.

However, I would argue that a certain trend in television production suggests that the blockbuster isn’t dying, but in some cases may be meeting the challenges cited by those who prefigure network television’s death – and in ways not contradictory to Anderson’s own observations. In his book, Anderson also describes the vital role of so-called filters that drive demand down the long tail, to more and more obscure niche products. The filters primarily addressed are online ones, such as “user recommends” metrics on long-tail exploiting Internet businesses like Amazon and Pandora. What these examples ignore is the way in which preexisting intellectual properties can also act like filters, pushing demand down the “tail.” In fact a recent trend in network television programming – a trend I call tentpole TV¹ – follows just this tactic, exploiting the streamability of content. Streamability is a new media term, coined to describe the way in which entertainment products have increasingly been made to be more replicable, more modular, and more transferable (Murray, 2005). I argue that the use of long-tail economics does not eliminate the blockbuster in television but gives rise to this other trend that, by moving affiliated content through multiple channels, allows the filter of the brand to soak up fabled latent demand all the way down the long tail. For example, one can look to the program *Lost* (ABC, 2005–2010), which hypothetically amassed the largest share of its revenue from its traditional on-air advertising, a little less from DVD sales, a little less from online advertising on affiliated websites, a little less from the share of profits from licensed video games, a little less from licensed novels, magazines, and so on. It is not unreasonable to suspect that, by combining all of these services and products associated with *Lost*, one could construct a model of distribution not unsimilar to the long tail, with demand progressively shrinking but always present – all the way down to the *Lost* candy bar.

Tentpole TV has been accompanied by managerial creativity among television professionals, a fact lampooned in a recent *New York Times* article that began with a job announcement for a television executive who knows how to move content and

how to “shovel it onto the Internet in a way that makes money” (Siklos, 2006). Not quite as lost as this article suggests, tentpole-TV makers have actively experimented with new job roles and functions. And, as attitudes toward television’s ancillary texts – traditionally maligned both in the academic and in the popular press as the zenith of the so-called commercialization of culture – have significantly softened and as the economic fortunes of network television have shifted, a new breed of storytellers, eager to exploit multiple media channels, has been employed in key creative positions. High-profile network showrunners, from *Lost*’s Carlton Cuse and Damon Lindelof to *Heroes*’ (NBC, 2006–2010) Tim Kring, have picked up on the concept of transmedia and have used it as justification for their own increased creative presence in everything, from *Lost*’s alternative reality game to *Heroes*’ web comics. Recently National Broadcasting Company (NBC) Universal head Jeff Zucker commented upon this growing practice in the field of network TV by stating: “All of these things have to line up early on in the food chain but not drive the creative” (Wallenstein, 2008). Translated from management speak, Zucker’s comment is arguing that, to be successful, transmedia must originate in the creative writing core of a series. By more aggressively overseeing the creative integrity of a program’s off-air manifestations, the job of showrunner has evolved to “managing a brand” – in the words of *Heroes*’ Tim Kring (Kushner, 2007). This means that showrunners are responsible for more than just the writing of scripts and the editing of episodes – namely for the maintenance of an entire textual world. For example, the *Lost*-themed mobisodes (original content for cellular phones) *Lost Missing Pieces*, penned by series writers, feature brief character moments, many depicting events implied in the on-air series, or “missing pieces.” In other words showrunners must pay careful attention to the on-air program’s unarticulated gaps and ellipses – textual aporiae that can become the source of the next transmedia text. Moreover, such work necessitates the existence of a more aggressive breed of creative managers and middlemen to oversee all the expanding manifestations of the core series. For example, *Lost* reportedly relies on its accountant-turned-writer Gregg Nations to maintain a ledger on all the minutiae of the intricate series. Showrunner Carlton Cuse described the staff’s reliance on Nations’s book-keeping in a recent *New York Times* article by saying: “we quickly realized that we needed some system to keep track off all the details, that we weren’t going to be able to do that by memory” (Wyatt, 2009).

At the same time as series writers and producers have reconfigured the organization of their own work, they have aggressively reached out to an army of freelance creative workers, incorporated in a vast system of loose social bonds, to provide transmedia extensions. Considering just these sort of changes, journalist David Wolf began a recent *Broadcasting and Cable* think-piece by pondering: “What does the term ‘television mean?’” (Wolf, 2007). In the article, Wolf sees uncertainty in the future of the TV business, given the flood of new entrants and platforms. This picture of a television with shifting boundaries and with an inconsistent set of personnel echoes observations made by a certain strand of contemporary social thinkers, who have turned away from the image of a powerful “Society” to examining the much more complicated fluid arrangements of what we may call loose social bonds. These diverse sets of theorists have considered

the diminishing power of institutions to guide action (Bauman, 2000); they have more rigorously isolated the importance of individual practice in reconstituting these institutions, now fragile (Bourdieu, 1977; Giddens, 1979); and they have studied the consequences of the increasing atemporality and aspatiality of contemporary networked and individualized labor arrangements (Castells, 1996). Despite vast theoretical differences and inconsistencies between these and like-minded thinkers, all would agree that, in the social science of the past, the solidity of social institutions, of their roles, of their boundaries, and of their bonds was overstated. Tentpole TV, I would argue, with its temporary, individualized bonds between workers along the long tail, with its unclear boundaries between traditional and other new media, with its shifting and evolving responsibilities for old and emerging professions, and with its experimental textual forms, becomes a model illustration of just the sort of agglomerations referred to by theorists of loose social bonds and a set of provisional responses to David Wolf's central query.

The looseness of networked bonds plays itself out in interviews with transmedia professionals as an organizational ambivalence that wants both to pull ancillary media in close to the creative core of the series and to keep it separate. To enforce their outwardly ambivalent attitude towards transmedia, television producers as a whole have largely favored a set of industrial practices designed to minimize contact between freelancers and their on-air supervisors. In the first case television producers, in order to maximize the economics of the long tail, rely on the work of freelancers to fill out the textual worlds of tentpole TV programs – a project whose sheer volume, complexity, and associated expenses invalidates simply relying upon the work of the series staff. While in television most labor is temporary, transmedia labor, in kind, is frequently freelance and project-based, minimizing producers' obligation to ancillary creatives.

Contact with freelancers is also minimized through a system of organizational barriers designed both to coordinate the approval process and to limit feedback loops. Despite the fact that freelancers often negotiate the exclusive rights to the adapted property, they are still beholden to the internal approval processes of the original IP owner. However, television producers have largely avoided micro-management in favor of looser structures of oversight. For example, writers of media tie-in novels based on network television properties have described their process as one marked by "double approval," which refers both to these writers' distance from the creative core of the series and to the temporality of their work. In the first case, "double" refers to the fact that authors are twice removed, from series producers and writers, through a system of middlemen, be they editors or licensors. And in the second case "double" refers to the fact that the authors' work is reviewed at two key hinge points, the prospectus and the manuscript, with no contact in between. Commonly it is during the pre-production phase that transmedia freelancers receive most scrutiny. One comic-book editor of television-licensed titles described his own firm's approval process to me in a personal interview by stating:

There's usually more scrutinizing at the start because its more a matter of just making everyone feel comfortable with the direction of the story, the look of the artwork. And

once they [licensors]’re comfortable with that, they tend to trust you a bit more and don’t scrutinize to the same degree.²

Infrequent contact is also an expected mode of behavior in the affiliated video game industry. An article published by the industry website *gamasutra* vetted the advantages and disadvantages of working on licensed titles, warning: “Get used to hearing the phrase, ‘I’ll get back to you by Wednesday especially on Thursday’” (Nixon, 2006). The approval process, however, is much more complicated in the case of current-generation video games that, because of their audio and visual sophistication, have to negotiate separately the likeness rights of acting talent, in addition to securing the property license.

Contact between the creative core and freelancers is also complicated by the temporal limitations placed upon transmedia creatives, which similarly minimize contact. Typically tight deadlines often imposed by IP holders make frequent contact and confabbing simply impossible. Artists working on the *Heroes* webcomic described working on a turnaround for as short a period as five days, while media tie-in writers are typically given three months to assemble a final manuscript. And, because transmedia workers are hired per project, they too are financially motivated to work very quickly. For example, one tie-in novel writer in a personal interview explained to me: “I try to write six or seven books a year because that’s how you make a living [. . .] If you spend a year writing on an *Alias* book, that’s a recipe for bankruptcy.” Similarly, the field of licensed video games is notorious for its rapid schedules and time crunches, which often result in compromised and hurried products.

Typically, licensed texts are arranged through an advance versus guarantee model whereby an outside organization guarantees the IP owner a minimum reimbursement, a large portion that is immediately paid – the advance; the remainder will be paid through royalties on each licensed unit sold. This means that these deals are generally low risk for IP owners; the latter receive the guarantee regardless of performance. While transmedia firms, be they video-game publisher or comic-book company, bear the financial risk, they are still held in check by the potential veto power of the approval process. As a result, the organizations and the freelancers who work for them practice a very measured form of self-censorship, which ensures that their work avoids the paradoxical constraints of both repeating and contradicting the on-air series.

Without anything resembling day-to-day, face-to-face contact to ensure creative integrity, tentpole TV producers often rely on several techniques to maximize trust and to undergird loose social bonds. Workers are often selected on the basis of pre-existing inter-firm relationships and of their native reputation systems. For example, when Fox’s *24* sought to produce its own series of mobisodes, it tapped a producer who had previously filmed DVD (digital versatile disc) extras for the program’s season box sets. Frequently producers farm out hiring and other creative decisions to trusted “brokers” (Dimaggio, 1977) or “contact men” (Hirsch, 1991). For example, the *Heroes* webcomic was staffed by artistic personnel (penciling, coloring, lettering)

all affiliated with the small, Los Angeles-based comics firm Aspen MLT (Michael Layne Turner), whose own editors were in charge of hiring decisions. Reportedly this inter-firm relationship was based on the efforts of *Heroes* and of comic-book writer Jeph Loeb acting as a contact man with a prior co-collaborator – Aspen founder and comic artist Michael Turner (Tabu, 2007).

Former freelance *Star Trek* writer and inventor of the Tribbles, David Gerrold (1973), describes the impossible position of freelance writers in television: paradoxically, they have to know more about the program than its writers, without having access to production data. The question then becomes how in fact these freelancers can guide their own work with minimal contact from the series. One can assemble a set of explicit and implicit mandates given to freelance workers; but more frequently I have found that these workers act on insights given by their fandom for the on-air series. In his *Art Worlds* (1984), sociologist Howard Becker discusses the vital role that conventions play as social glue that binds together the members scattered throughout any given artistic endeavor. I argue that details arrived at through fannish enthusiasm and through repeated viewings act in a similar manner, allowing freelancers to make more or less appropriate creative decisions without intimate coordination with a program's creative core. Nearly without fail, all the transmedia freelancers I have talked to expressed at least a casual devotion to the franchise they worked on prior to employment. And fannish desire for transmedia integrity matches or – arguably – exceeds such a desire among IP holders. The convention most frequently discussed by tentpole TV freelancers is the use of character – a conglomeration of actions, attitudes, and backstory – to make decisions. For example, a freelance writer on the *24* comic minimized the importance of the real-time format in the translation of the series, claiming that it is the character of Jack Bauer who guides the series and his interpretation of it: “Jack Bauer hits at something basic that’s missing from other media. And it’s that he’s resolute . . . it’s a sort of modern interpretation on the John Wayne mythos.”³ I argue that academic media studies must take seriously these sometimes idiosyncratic, distributed industrial arrangements, their resultant practices, and their textual consequences if it is to track properly this discipline's always elusive object of study.

Distributed Assistanthood: Dues-Paying Apprentices and “Desk Slaves”

Erin Hill

This is the business, always has been and always will be – it’s called paying your dues by working long hours, taking it up the ass and not getting paid [. . .] – if you can’t hack it, then go back home, live with mommy and daddy and work at the local bank.

Deadline Hollywood commenter discussing assistant pay cut (Finke, 2009)

Blogger Nikki Finke's recent report on the pay cut planned for assistants at the newly merged William Morris Endeavor Entertainment (WME) talent agency was met with a surprisingly vicious response from her readers (2009). The reactions, which appeared on the comment thread of her *Deadline Hollywood* blog, were not surprising simply by virtue of being angry – indeed some venting was to be expected by, and on behalf of, the assistants in question, given that what was at stake was a nearly 20% drop in salary (from \$13.50/hour to \$11.00/hour). Rather the anger of the “commenters” (to use the online term) was surprising because it was expressed most frequently and most vehemently in *support* of management. Commenters applauded the architects of the pay cut while admonishing assistants that they were “not coal miners” and telling them to “sack the fuck up and deal with it,” to “grow up!! The world isn't fair . . . get used to it,” and even to “try Iraq for three years” (Finke, 2009, p. 1). These respondents further insisted that the assistants would be foolish to strike, since “in this town, walkout equals lock out” and they'd quickly be replaced by others “chomping at the bit to take their place” (ibid.).

Finke's blog, though *de rigueur* reading for many Hollywood insiders, is unaffiliated to any studio, agency, or network. Therefore it's easy to dismiss the comment dustup as a random Internet flamewar, separate from the entertainment industry proper and from its system of production. However, I would argue that the blog and its comments are very much part of the system and represent a perfect example of one of that system's most important sustaining functions: the continuous development of industrial mythology that, over time, is codified and dispersed as fact through its creative products, and by and to its members. It is this mythology that surrounds and supports the system, helping to contain and control the contributions of low-status workers – such as assistants to writers, producers, directors, agents, and executives. Despite claims to the contrary made by the industrial boundary police on Finke's blog and elsewhere, these workers are absolutely essential to the industry's products and do impact them creatively. Examining the specific mythology at the root of the *Deadline Hollywood* exchange, as well as its historical precedent, will help explain the lowly place of assistant work in the Los Angeles film and television industry and why assistants not only stand for poor treatment at the hands of employers, but are often willing accomplices in perpetuating it.

Popular shows like *Entourage* (2004–2011) and films like *The Devil Wears Prada* (2006) glamorize creative industries right down to their scut workers (the assistants), and, through the hero's journey narratives, explain these industries as a world that can be navigated and mastered – if one is willing to accept that world's rules. Industry workers and aspirants who watch these types of texts see the Hollywood entertainment industry as being ordered and as making sense, when – as Caldwell points out – in reality “production cultures are far too messy, vast and contested to provide a unified code [. . .] for breaching [their] walls” (2008, p. 36). Caldwell argues that the industry self-theorizes, codifying the accumulated industrial myths into a relatively unified mythology, which keeps an increasingly divergent mixture of industrial modes from diverging completely (p. 34). This mythology is especially useful in keeping low-status, entry-level

jobs filled with cheap labor. In studying assistant work, I've identified the advice, stories, and "industrial wisdom" surrounding the concept of "dues-paying" as an overarching mythology that makes such a feat possible in this sector.

Actual assistant work is usually some combination of clerical and administrative work, personal errands, and creative/executive-level work on an employer's projects. Some actual assistants have supportive, mentoring employers and others wind up on the desks of bosses who are abusive and who assign them only unrewarding tasks. Despite this range of experiences, the mythology that has evolved around dues-paying – the process of "paying one's dues" at a low-status job in order to prove worthy of a higher status position – tends to elevate and celebrate the harshest, most embarrassing extremes of assistanthood and the most abusive, "screamer" bosses. From TV shows to chick-lit novels and to networking websites, stories of assistants completing unsavory tasks and taking vile abuse circulate endlessly. The stories might be mistaken for simple "venting," if they didn't so often carry the moral that these sorts of experiences should not be shunned but rather desired, as the trial by fire necessary for advancement. Just one example of that moral at work can be found in the how-to manual *It's All Your Fault! (How to Make It as an Assistant in Hollywood)*, which describes "assistanting" as "a purgatory" and "a rite of passage which, if suffered and surmounted, can land you in those heavenly regions beyond the pearly gates of Brentwood or Los Feliz" (Robinson & Morris, 2001, p. 14).

On the Finke blog, the necessity of dues-paying seems to be the only thing that all commenters agree on. Many times throughout the blog's 172 comments from June 16, 2010 on, assistants and their defenders qualify remarks by insisting that they know they must pay their dues, while the faction in favor of pay cut accuses assistants of not being willing to go far enough, insisting that they accept their fate, because "[t]his is the business, always has been and always will be" (Finke, 2009, p. 1). Statements like these show just how effectively dues-paying mythology contains worker dissent, since, contrary to the industrial wisdom it purports to impart, the dues-paying model of suffering for *entrée* is by no means the way "it always has been." In fact, for the first 60-plus years of the entertainment industry, this model didn't exist at all. What did exist was a sector of the workforce that was allotted low pay and low status because it was sex-segregated and feminized.

In the early days of film, the implementation of Taylorist "scientific management" meant that studios segregated work into scores of new "departments," as I detail elsewhere.⁴ This in turn produced an explosion of paperwork – an intermediate product that economists refer to as "clerical output" (Fine, 1990, p. 12). New business technologies designed to create and store this clerical output had been gendered as female, and clerical work was feminized, because women could be paid and promoted less and were thought to be more "manually dexterous and tolerant of routine" than men (Davies, 1982, p. 55). In the film industry this workforce made possible increased paper communications between various departments and the directors, producers, and executives who served by turns as managers in the developing system of production – which Janet Staiger describes in its various stages in *The*

Classical Hollywood Cinema (Bordwell, Thompson, & Staiger, 1985, pp. 128–142) – so that large numbers of films could be tracked and monitored. In this developing, large-scale system of film production, women – as secretaries, stenographers, and script girls – became the primary producers, distributors, and custodians of the clerical output without which the expanding studios could not have functioned, and they provided much needed rationality and control to the system of production by serving as the recorders, rule minders, and timekeepers of the creative process. For this they were rewarded with a salary that was competitive with those of other skilled “women’s professions” (e.g., teaching or nursing), but they had little expectation of promotion out of the female-dominated clerical ranks. However, especially at the highest creative levels of the production process (i.e., in the offices of writers, executives, directors, and producers), secretarial work at studios was not actually limited to the clerical sphere.

As Kathleen McHugh has explained, by the early to mid-1900s domestic labor had come to be associated both with the subjective, emotional, and maternal values stemming from the nineteenth-century cult of domesticity and with the rational, organized, and detail-oriented qualities encouraged after its early twentieth-century transformation into the discipline of home economics – a process influenced by Taylorism (McHugh, 1999, p. 61). The result was that woman’s identity was variously constructed as emotional caretaker, household manager, wife, mother, and detail-oriented record-keeper/organizer. These jobs were meant to be carried out with the appearance of ease, or of doing little (p. 76). Studios similarly assigned women to detail work, but they also expected them to take a managerial view of the sphere they inhabited through effortless multitasking, list-making, and filtering of information. There, too, they were called upon to use wifely, motherly, or daughterly skills to nurture co-workers, to mitigate the emotional content of messages, to communicate pleasantly, and to exercise an influence under the guise of feminine passivity, all while rendering their efforts virtually invisible through other aspects of gendered performance – such as chatter, flirtation, and gossip associated with girlish pleasure and leisure.⁵ Self-effacing, extra-clerical skills from the domestic sphere even enabled some women to expand their duties in order to better meet the needs of their employers or co-workers in film production, and in some cases they achieved a measure of creative agency despite their relatively powerless positions. Such was the case with Marcella Rabwin, secretary and later executive assistant to Hollywood producer David O. Selznick from 1932 to 1944. In the mere five pages that she devotes to her own career at the end of a memoir filled with stories of the celebrities who crossed her path, she admits to running Selznick’s offices, holding meetings in his place, composing many of Selznick’s famous memos herself, and signing his initials “as authentically as he could” (Rabwin, 2000, p. 161); but she refuses to take even the smallest amount of credit for his creative achievements. Like many successful female workers in the studio system, Rabwin achieved a kind of agency, but that agency came in part through her willingness to confine the signs of her own authorship to the reference initials at the bottom of Selznick’s memos.

The use of femininely deployed skills –by which I mean skills normally thought of as masculine, such as delegating orders to underlings, which are rendered non-threatening by a female worker when deployed with or disguised through some kind of feminine performance (e.g., nurturing) – seems to be common to successful workers in feminized, clerical-based jobs. I group these skills under the heading of *creative support* – a phrase of my own construction, which draws not only on the concept of *gender performativity* advanced by Judith Butler, where gender is constituted “through a stylized repetition of acts” (Butler, 1990, p. 179), but also on Arlie Hochschild’s characterization of the parts of workers’ jobs in which “the emotional style of offering the service is part of the service itself” as *emotional labor* (Hochschild, 2003, p. 5). Hochschild defines emotional labor as labor that “requires one to induce or suppress feeling in order to sustain the outward countenance that produces the proper state of mind in others” (ibid.). *Creative support*, then, represents the combination of feminized skills, gender performance, and emotional labor deployed in these different, clerical-based women’s jobs to support the movie-makers, to facilitate their creative vision, and, occasionally, to impact that vision. This phrase helps to link and explain the methods by which different female movie workers fitted themselves into the studio system by working *through* their gender in a way that was acceptable to that system.

Although the ranks of assistants in contemporary Hollywood are far more gender-integrated than those of secretarial staff in the studio era, the actual work they do is not. The official job duties of assistants have changed very little since the studio era, and the unofficial expectation that assistants offer employers self-eliding creative support subsists as well.⁶ Additionally, despite great social change since the studio era, many socially constructed, essentialist notions of men’s skills versus women’s skills remain in the minds of both workers and employers, even though the language of job ads and corporate documents is gender neutral.⁷ Therefore, though there is no such thing as a typical relationship between an employer and an assistant in today’s freelance, ad hoc entertainment industry, I argue on the basis of this evidence that assistant work remains feminized across gender. This continued feminization goes part of the way to explaining the continued low status and compensation of assistants, since pay may not have increased when men came to the field in large numbers if assistant work was still coded as “women’s work.” However, to explain how continued low wages were accepted by the new, gender-integrated generation of assistants, it is necessary to return to the concept of dues-paying.

In the late 1970s and early 1980s, at about the same time as assistant work began to be gender-integrated, modern assistantship shifted from being a career separate from others in the industry – one from which workers could not expect promotion – to a dues-paying quasi-apprenticeship in which workers were primarily compensated not in money, but in training for their future profession under one of its masters. Though it goes by various other names (trainee programs, internships, assistant hyphenates), apprenticeship is common practice in unionized below-the-line film professions, so it makes sense that it has been adopted by above-the-line profes-

sionals and agents. However, the difference between an assistant location manager and a producer's assistant is that, as with any real apprenticeship, the assistant location manager's union – the 399 teamsters – regulates the length, pay, and conditions of its members' apprenticeship and determines when they are eligible for promotion and pay raise. By contrast, there are no rules governing an assistant's pay, how he or she earns it, and what kind of training or promotions he or she may receive.

In reality, assistantship hasn't changed from the days of secretarial work so much as it has been rhetorically rebranded, so as to have the appeal of an apprenticeship without offering any of its guarantees. Hence the widely varying range of pay and work experiences of contemporary assistants.⁸ The mythology of dues-paying retrofits those parts of the apprenticeship system that are most favorable to management on to those – formerly gendered – aspects of the job that are equally favorable; then it spins the new combination as being not only attractive, but a key to success in the business. The sanctioning of work conditions through dues-paying might be more defensible if the promises of the dues-paying mythology were more consistently delivered. My research has shown, however, that, far from it being the case that assistants find themselves on track to creative or executive positions after a few years on the job, there is an extremely large assistant dropout rate due to the financial, mental, and emotional strain endured by workers for up to 10 years without promotion.⁹

The dues-paying mythology makes little mention of the contributions that assistants make to the creative process. However, like the earlier studio secretaries, the assistants in my study found themselves participating in creative projects through contemporary forms of creative support, which go from proxying for, and filtering non-creative work away from, employers to delimiting creative solutions to problems (say, generating writer lists or narrowing a field of 50 scripts to the five best) and to actively generating content (such as by creating transmedia texts). The impact of an assistant's work on creative texts was not as clearly delineated as that of the work of those higher in the creative food chain, who often characterized assistanting as ancillary, or parallel to the creative process. Yet, as members of the network that creates screen content, assistants were clearly essential to the process, being responsible for a large portion of the distributed knowledge that went into collaborative efforts and quietly carrying out a large share of the development and production work that took place on paper.

Far from being ignorant of the discrepancy between their value to the system and their compensation, most assistants recognize and accept it. Though California's labor laws for working overtime are broken every day in Los Angeles, offenses are seldom reported and attempts at unionization are rare and fruitless, since, under the rules of dues-paying, complainers "never work in this town again." The assistants accept their fate because most of them believe that, if they pay their dues, they will be rewarded. And when they aren't, the mythology is in place to shift the blame from management to the assistants, for being unwilling to pay their dues. Of course, the only definite beneficiary of this policy is the industry that continues to sustain itself on these workers' backs. This helps to explain why *Deadline Hollywood* blog com-

menters with seemingly little stake in the dispute angrily champion management over labor. Whether they've transcended assistantship, are themselves assistants, or are outsiders looking in, the commenters actually do have a stake in the argument: a belief that the system is rational and that they have the ability to succeed – if only they can master it. And so they defend the system, policing its boundaries and its mythology, just as they've been mentored by television or job gossip to do. This rationalization sanctions the system, helping it contain exactly the kind of dissent that, ironically, might ultimately make it fairer and more masterable.

Sourcing Film Market Intelligence: Box Office Data, Tracking, and the Hollywood Stock Exchange

Eric Vanstrom

Together with creativity, Hollywood distributes much of the collection, measurement, and analysis of market and audience data to outside research firms. This case study examines one such firm: the Hollywood Stock Exchange (HSX), a virtual market that uses “crowd-sourcing” to aggregate knowledge about box-office gross, star power, and other entertainment “commodities.” In tracing the historical shift in box-office information from industrial secret to a widely reported and analyzed cultural topic, I argue that box-office data are the primary tool through which organizations and participants make sense of the film “market” and attempt to limit market uncertainty. HSX is then contextualized as a part of the industrial practice of “tracking” – that is, of accessing box-office potential through audience research and historical modeling on the basis of various textual variables (genre, star, director, soundtrack, etc.) and contextual ones (release date, competition for viewers from other release, number of theaters, distribution/marketing strategy, demographics and patterns of consumption, etc.). HSX's users analyze, distribute, and create market intelligence as they track production news, promotions, marketing strategies, and audience interest; in short, HSX traders are encouraged to act more like studio marketing specialists and researchers than like objects of research, subjugated by surveillance (see Miller, Govil, McMurria, Maxwell, & Wang, 2008, pp. 282–294). HSX suggests how market knowledge and forecasting expertise are distributed ad hoc and well beyond “professional” media organizations, to knowledgeable and engaged film audiences.

However, HSX traders are also *products* of technological and economic forces that reshape all aspects the film market and media research. In particular, the evolution of digital technology and of computer networking has created exponential growth in consumer and market research industry and has shifted the amount of data available and the ways in which they are collected, analyzed, and circulated. Media fragmentation (new media delivery platforms, the disaggregation of content, and increased bandwidth) and audience fragmentation (“long tail” economics and niche audiences) have thrown traditional market and audience measurement tools and

methods into disarray. In some ways this has made audiences more elusive and unpredictable, while in other ways:

[N]ew systems of measuring media audiences, of gathering feedback from them, and of anticipating their tastes and preferences [. . .] are making it possible for media industries to fundamentally redefine what media audiences mean to them and how they factor into the economics and strategy of the businesses. (Napoli, 2008, p. 2)

HSX traders are at times unruly and unpredictable, but, as with studio executives and film marketers, maximizing profits and limiting market uncertainty is their collective mission and interpretative framework for accessing films.

Box-office grosses have always been important within the film industry, but the weekend/weekly charts as we know them today were brought on by conglomeratization of the media industries, the ever-shortening window for distributing and marketing studio films, and shifts in how box-office numbers are collected and distributed. Hollywood studios were historically reluctant to reveal financial information about their operations. Moreover, box-office data were difficult to obtain and of limited value until the late 1970s. Reflecting the classical Hollywood film market, box-office numbers were regional, unevenly compiled over time, and largely utilized by theaters in the hope of gaining any knowledge they could about the films that might find their way into their theaters. Not surprisingly, given the decline in attendance, increased competition in the media marketplace, and the development of consumer research in other fields after World War II, “the use and development of film audience research began to accelerate” (Handel, 1950, p. 4). By 1985 independent firm Entertainment Data, Inc. (EDI, later Nielsen EDI) could offer a complete national picture of box-office sales electronically, in real-time. And the speed at which box-office data now circulates has helped to reshape the film market (by front-loading almost all marketing and promotional activity in order to generate good opening weekend numbers) and labor (by turning each film release into a full-blown “branding” campaign on a global scale and continually adjusting to local market feedback).

In the contemporary Hollywood of tentpole productions and increased risk associated with every picture release, the high costs of saturation distribution and their massive marketing campaigns ramped up the need for more accurate predictions of box-office potential. And the coming wave of corporate culture and highly educated executives with postgraduate degrees in finance, advertising, and consumer goods would soon turn “tracking” into an astoundingly strategic practice that balances advanced polling, demographic-minded mapping and scheduling, and sophisticated historical models (Wyatt, 1994). Since 1978 National Research Group (NRG) has been the primary supplier of tracking information culled from random national telephone surveys and from its own historical box-office database. In the mid-1990s the development of the Internet along with massive decline in media audiences created opportunities for new research firms to compete with NRG’s dominance; these firms included the Online Testing Exchange (OTX) and MarketCast, which attempt to

reach subjects online. In 1997 NRG was bought by VNU (a Dutch publishing company), which publishes *Variety* and now owns Nielsen Media Research. Reed Business Information, publisher of *The Hollywood Reporter*, bought MarketCast soon after. The consolidation of the media research and business information industries mirrors the consolidation and globalization of media industries and audiences in general, as well as the collapsing distinctions between them, as these firms expand their reach across media and around the globe in order to offer an ever more “complete” picture of consumer behavior and of the integrated media marketplace.

In the last 20 years, tracking methodology has also shifted from controlled survey groups and telephone polling toward qualitative research informed by crowd-sourcing, ethnographic research methods, and passive electronic monitoring systems (used by Nielsen EDI and Rentrack to report box data electronically, in real time). Moreover, the availability of tracking data has also exploded, thanks to movie-related services like Moviefone and Fandango, which “harvest” site traffic, search data, and ticket pre-sales and monetize them as tracking research sold to studios and theater chains. Film-related websites, like *imdb.com* and *rottentomatos.com*, harvest tracking information by surveying visitors’ awareness of certain films and willingness to see them, producing data that is then shared with clients and partners. Some sites, like HSX, will offer the findings from these ad hoc surveys back to the online community, as a means of generating activity and traffic on the site.

Outside the film and media research industries, box-office data – and even tracking numbers – circulate widely, as part of our understanding of the film industry and popular culture. Box-office data are widely reported as items of general news and have become the ground for something of a marketing race between studios, as they compete to “win the weekend” in order to sell the film’s success as a reason to see it. In that way box-office gross is a cultural obsession and a part of the popular understanding of Hollywood movies, especially as professional film criticism fades in influence and notions of commercial success appear to be merging with ones of quality. Today, just as film distribution and marketing rely on these data to make industrial decisions about how to produce, market, and position films in order to limit risk, audiences increasingly utilize the same data to navigate their participation in the market. Arguably the prevalence of market data in popular culture and their use among members of audiences increase corporate transparency; but, as the HSX example demonstrates, box-office data and tracking information are increasingly mixed up with reflexive movie-marketing strategies and campaigns designed to cultivate niche audience, to control viral word-of-mouth promotion, and to blur the line between market data and marketing. The fetishization of box-office numbers in industrial and consumer cinematic discourse today is an excellent example of how Hollywood blurs the line between cultural/artistic production and economic/business activity.

Created in 1996, the Hollywood Stock Exchange is another interesting example. HSX describes itself today as an “integrated marketing, research and technology company driven by its patented entertainment stock market” (Lamare, 2007). This

carefully worded company boilerplate is intended to capture the multitude of practices and profit models that make up HSX as a business-to-business research service and as an ad-supported virtual market for consumers. As a “virtual stock market,” HSX allows would-be movie moguls to prove themselves in an online market that lets “traders” invest 2 million “Hollywood dollars” in Movie Stocks and Star Bonds and measures their bets as they rise and fall with each week’s box-office grosses against a pool of investors – who, according to HSX marketers, include a fair number of Hollywood luminaries. Complicating this distribution of industry analysis for fans is that HSX also wants “insiders” to play. “Insider knowledge is not only legal on HSX, it is encouraged,” claims the site. This mixing and “networking” of industry practitioners and audience is part of what makes this community unique. For these “savvy” traders, all relevant film information – such as cast and crew announcements, funding issues, production problems, marketing materials, and so on – usually affects a stock’s price. Being good at the game is, then, not easy. It requires – even from crowd-sourced outsiders – detailed knowledge of how feature film production, distribution, marketing, and exhibition are organized and operated and of how the market/target audiences are liable to react to a film in relation to developing information. In short, HSX makes the crowd think about films like studio marketing specialists or executive producers.

Markets, whether based on actual or on virtual currency, are excellent aggregators of information and very good at answering questions that have a definitive solution, like box office (Surowiecki, 2004). HSX’s “movie stocks” are pegged to a film’s domestic gross four weeks after release. Through the trading activity of users, the price of a particular movie stock offers a forecast of the box-office gross after a month in release. In that sense, the exchange functions as a “prediction” or “futures” market – that is, a speculative market that creates assets whose final value is tied to a particular event or market outcome. Anita Elberse (2005), professor of marketing at Harvard Business School, compared HSX’s forecast, as a prediction tool, with other tracking methods, and found – astonishingly – that the HSX closing price the night before a movie’s opening is the single *best* available forecast of its weekend box office. HSX is more accurate at predicting box-office results than traditional “insider” tracking methods. The ability of prediction markets to aggregate the distributed intelligence of a diverse group of “outside” traders (with different and uneven degrees of market knowledge) into an accurate forecast has stimulated the industry’s embrace of “the crowd.”

Recently a number of books and articles about prediction markets began championing the “democratic” power of networked prediction markets in terms familiar to academic cultural studies, theories of resistance, and historical theories of technological determinism. These arguments pitted the “collective intelligence” of the people and the inherent liberating potential of the “participation,” “interactivity,” and collective engagement of the Internet against the increasingly irrelevant bureaucratic old-guard “experts,” whose job is to analyze, understand, and predict market eventualities (Hubbard, 2007; Surowiecki, 2004). Not everyone is sold on this

phenomenon, however. Harold Vogel, president of Vogel Capital Management and author of *Entertainment Industry Economics* (1986), says that much of HSX is “window dressing and fluff to make people appear erudite, when they really aren’t,” but he adds that, “for the in-house studio prognosticators who make a living actually tracking film demand and adjusting marketing campaigns, HSX can be a valuable tool.” Apparently Cantor Fitzgerald, the financial services and bond-trading company that bought HSX in 2001 in the hope of turning its virtual market into a real one, recognized that potential too. Former Nielsen Media Research executive and marketer Andrew Wing was hired to oversee HSX’s market research product and to expand market partnerships for HSX. Thus HSX was conceived as a game designed to take advantage of the public’s obsession with box-office numbers and to harvest the forecast it produces as real-time tracking research, selling the data as well as ad space and promotional opportunities to film marketers, media analysts, and buyers.

Throughout its history, HSX has attempted to negotiate its competing visions of marketplace equality and information transparency for all with marketplace control and manipulation through proprietary systems of data collection and audience surveillance. For example, HSX founders, Wall Street brokers Max Keiser and Michael Burns, initially envisioned the site would “democratiz[e] the [film] financing process,” enticing virtual traders into becoming real investors in independent production (Lamare, 1996). Beginning in April 1997, HSX hoped to allow traders to invest real money in low-budget film, with breakout potential. “The concept is to democratize the filmmaking process,” explains Burns. “Why should it just be the studio executives who get to decide what movies we watch? How do they know what we want to see? And they think that we have no say, and we’re ultimately the ones that [*sic*] pay to see movies anyway” (quoted in Van der Zanden, 1997). Thus HSX was originally conceived as a film-financing marketplace that levels the playing field between producers and consumers by offering audience members the opportunity to become investors. The marketplace would do away with insider politics, nepotism, creative compromise, and other problems associated with the developing, financing, and green-lighting of a Hollywood feature and replace them with the populism of the free market. Market participants would have to put their money where their mouth is; tracking would become a pure expression of interest and personal judgment of the market (it seems to matter little whether that be construed as cultural taste or as investing acumen). Ideally a film’s potential could be judged on its own, before a saturation release would be forced onto the multiplexes and before market positioning, branding, and targeted ads/promotions would have a chance to tip the balance of marketplace equity.

More recently, Veriana Networks Inc. and Cantor Fitzgerald have used this line of argument as they lobbied the Federal Trade Commission (FTC) and Congress for approval of a real “box-office futures” market. Veriana’s Media Derivatives, which would only be open to professional traders, “will help better manage economic uncertainty and financial volatility,” according CEO Rob Swagger, who added that “every other segment of our economy has had a means to offset risk. The entertain-

ment industry has not had an opportunity for futures-type contracts” (quoted in Shields, 2010). Hollywood’s labor guilds and lobbying infrastructure back-lashed quickly, associating the market with gambling, suggesting how susceptible it was to manipulation, and arguing that, in a down economy, such a market would risk depressing box-office receipts further by “negatively affecting financiers’ and audiences’ pre-release perception” (Fleming, 2010). From the perspective of the Motion Picture Association of America (MPAA), box-office futures pricing is “lacking any reliable economic basis.” Thus the fault line here is really *perception*, protecting the industry’s ability to control and predict the marketplace through distribution, branding, and marketing of individual films. The industry-wide objection to film futures markets often postures as a concern to protect the creativity, art, and experience of film. Yet the objection is also about maintaining tracking research and box-office data as relative measures of profitability, quality, and success – both within the film industry, as career capital for above-the-line executives associated with a hit film, and between media industries, as sales data for, say, a television licensing deal. In this context, rather than “lacking any reliable economic basis,” box-office futures ground, even if they don’t fully measure, many of the economic activities related to the distribution and marketing of a film theatrically and across various release windows. However, the continued focus of tracking research and box-office receipts on a single revenue stream for films in a shrinking market is rather inexplicable – unless box-office analysis and reporting are seen as marketing/promotional tools for a film’s initial release, pushing the theatrical release as a “loss-leader” (since few films make turn a profit from domestic release alone) for the 10- to 20-year life cycle of Hollywood films today.

Tracking research and box-office data are, then, increasingly necessary, accurate, and available for measuring and anticipating audiences in today’s fragmented and cluttered film market. The importance of box-office data has spread to popular culture and influences filmgoers and our culture to view films in economic terms, as notions of entertainment and quality merge with ones of profit and chart position. In this way tracking research and box-office data are a part of what Caldwell (2008) theorizes as Hollywood’s “manic disclosure/non-disclosure” of industrial information, which it makes in an effort to manage and control risk in the globalizing and fragmenting film market. In audience communities like HSN, we have seen how increased disclosure and circulation of industrial data have encouraged the audience to engage with the film industry on its own terms, collapsing the distinction between producer and consumer as a matter of interpretative and informational differences. Such disclosure also seems to have improved and sped up tracking research, as well as the ability to forecast audience behavior accurately. At the same time, the collapsing distinction between marketing and market data, the interpretative relativity of tracking research, and the limitations of box-office data in relation to the profitability of a film over time are forms of non-disclosure that obscure the market, making audiences less predictable and yet, ironically, further exposed to market research and surveillance.

HSX's virtual market and traders are caught up in this paradox; they create and use market data and production information in order to forecast box-office profits, while the site not only sells its crowd-source intelligence, but also collects data about its users' tastes and moviegoing habits, in order to sell them to studios along with its real-time tracking service. The site also sells marketing space and promotional opportunities to marketers and media buyers looking to connect with savvy, reflexive audiences on HSX (mostly middle- to upper-middle-class men, aged 18 to 45). Partly because of the industry's manic disclosure/non-disclosure, contemporary film audiences are invited to consider the film market not as cultural expression, or even as simple entertainment, but as an object of economic and cultural analysis, and themselves as potential players in this marketplace. This distances the audience from filmgoing as a cultural and aesthetic experience, making economic frameworks the arena for interacting with and understanding the film industry. In this context, the MPAA's successful lobbying efforts against box-office futures – on the grounds that they would wither traditional labor divisions, that they would kill creative autonomy, and that such a market would be subject to manipulation from those with inside information – is not only a way of putting the cart before the horse, but also a highly hypocritical one.

NOTES

- 1 An informal, expanded list of these programs would include *24* (FOX, 2001–2010), *Alias* (ABC, 2001–2006), *Day Break* (ABC, 2006), *Drive* (FX, 2007), *Heroes* (NBC, 2006–2010), *Invasion* (ABC, 2005–2006), *Jericho* (CBS, 2006–2008), *John Doe* (FOX, 2002–2003), *Journeymen* (NBC, 2007), *Kidnapped* (NBC, 2006), *Kings* (NBC, 2009), *Life on Mars* (ABC, 2008–2009), *Lost* (ABC, 2004–2010), *The Nine* (ABC, 2006), *Push, Nevada* (ABC, 2002), *Prison Break* (FOX, 2005–2009), *Reunion* (FOX, 2005), *Surface* (NBC, 2005–2006), *Traveler* (ABC, 2007), *Vanished* (FOX, 2006).

- 4 See Hill (2007).
- 5 The monthly studio newsletters at MGM, RKO and Warner Bros. at this time reflect almost nothing but this gendered performance, with descriptions of female workers focusing on how much they like to giggle or chatter while rarely mentioning their work.
- 6 I base these claims primarily on interviews conducted with 40 assistants in 2007, as well as on my own experiences working as an assistant to TV and film producers for four years. See Hill (2007).
- 7 Many interview subjects stated that, when they heard of a plum job opportunity, they would try to discover, before applying, if the employer was looking for a man or a woman,

as many employers simply believed that only women could be good assistants: they were naturally more detail-oriented and had pleasanter phone manners. It's true that there were also instances of employers (usually men) who only hired men; but the explanation given for this preference was usually related to the belief that only men could absorb the kind of abuse the employer planned to hurl at them. This seems to indicate submission – an attribute associated with women under essentialism – to be an important part of the job. Indeed, the men I spoke to rarely if ever connected acts of masculine performance with success on a given employer's desk; they named instead self-effacement, submissiveness, and endurance of detail-oriented scut work as job prerequisites.

- 8 Among the assistants interviewed, salaries and work conditions ran the gamut from safe and respectful environments with decent pay and regular hours to downright hostile, sexually inappropriate, or harassing workplaces, and work weeks of 80–100 hours without overtime (Hill, 2007, pp. 71–111).
- 9 Of the 40 assistants I interviewed three years ago, only one has been promoted to a junior executive-level position, and seven have left the industry completely during the same period.

YouTube Stylo

Writing and Teaching with Digital Video

Alexandra Juhasz

ABSTRACT

The impact of YouTube on media production and distribution has been break-neck, immense, and seemingly irreversible. In this chapter I argue that media production professors need to embrace, and not to avoid YouTube, as if it was what the French call a *stylo*: a pen. To do so, we need to better understand YouTube and YouTube videos. I impart here some of the lessons I have learned from teaching an experimental course, Learning from YouTube, in which all the course work has been *about*, but also *on*, the site. These lessons illustrate the genres, contents, and styles of “video writing” that my students have developed to expand the reach of YouTube’s more standard and banal content. The lessons also address how knowledge of the technologies, ownership, architecture, and customs of the site can allow for careful, considered, and self-referential student work to become a critical part of this unruly archive.

Dreams of YouTube Writing

This, right here, is writing with words on paper about video on YouTube. This variety of YouTube writing uses words to call up digital sounds and images, in a scholarly prose common to the field of media studies. It is to be read on paper, in a chapter of

The International Encyclopedia of Media Studies, First Edition.

this book. However, the YouTube writing that is the focus of this chapter is a new kind of academic text (and cultural object), enabled by digital technologies that allow for video to become something akin to a pen ideally suited for expressing critical thinking about a medium within that very medium. In the second section of this chapter, I will introduce 10 writing styles displayed in YouTube videos made by my students for the course *Learning from YouTube*, which was held on and about YouTube in the Fall of 2007, 2008, and 2010. In the course, my students' videos (their sole academic assignments) examined YouTube critically by speaking through its own forms. In the process their videos, and this chapter about them, also trace the shape of the culmination of a dream: what communication might look like when it is freed from the constraints of word and page; what students might say when they are liberated by technology and enabled to speak about media, while being aided along the way by an education in video history and production as well as by critical media literacy (and also aiding them). The first section of the chapter sets the historical, pedagogic, and personal dimension of this dream of writing; the second will investigate what was realized in the student work – or in the YouTube writing – that was actually produced.

I came to teach on and about YouTube in 2007; I was both hopeful and critical. This corporately owned platform makes the most of several digital technologies in order to facilitate video production, distribution, and storage for increasingly large numbers of users who have access to a computer. While YouTube is essentially a platform for exhibition, it has taken on many other functions as well: people make, comment on, store, view, and move videos off it. YouTube holds videos and advertisements made by people and by corporations, as well as serving as host for personal, corporate, and non-profit “channels” that curate video for other users from its huge “archive” of moving images. YouTube's architecture and corporate imperatives set the standard for the conventions of socially networked video. Thus, when I say “YouTube” across this chapter, I refer to these many things, all under the umbrella of this brand. However, in what follows I am most eager to talk about less common uses of the platform, namely about YouTube as a form and forum of academic writing and education. Of course, while we were using it in this anomalous way, YouTube always also remained a larger cultural and corporate form of entertainment, revenue, and expression, and we spent a good deal of our energy trying to understand these facts by generating user-generated video about them.

Like many others (in and out of academia), I believe in the best for people-made culture, and I am certain that media literacy plays an important function in this project. Educating students as well as activist community members about making media and thinking critically about them has always been central to my work. My dream has been to participate in the production of committed media – media that rely upon, reference, and produce historical, artistic, and theoretical knowledge, committed to an articulated project of world- or self-changing. My goals for the course were similar to those of earlier projects that had focused upon writing and teaching about, and making, the committed media of AIDS activists, feminists, antiwar activists, and queers. For my class *Learning From YouTube*, our efforts

would be to understand the uses, structures, vernaculars, limits, and possibilities of a new media phenomenon and to work together to push this platform toward loftier goals than entertainment: that is, toward education, community-building, self-expression, history-making, and activism. Thus, together, we would produce contemporary media criticism using YouTube as our subject and pen (there was very little written about YouTube by scholars in 2007). Ours was a hopeful and productive use of the site, one that enabled community, critique, and control in an otherwise often resistant online environment (corporately controlled, entertainment-driven). Of course, while the technology was new, the underlying commitment to this pedagogical (and penmanship) project – to integrate media production, theory, literacy, history, and activism – has a long history in and out of the media production college class.

Thus, before I turn to what my students and I learned about using YouTube as a pen, about critically writing about a medium within that medium, I will look at the history of this older vision about media writing: “It is always interesting to review old utopian visions, as they remind us of our part in fulfilling the expectations of earlier generations,” writes Bjorn Sørenssen (2008, p. 48). He continues: “By developing new media technology there is also created a new and changed pattern of production and distribution and, subsequently, a new aesthetics” (ibid.). The 10 YouTube writing forms that follow – our new “YouTube aesthetics” – are the culmination of a century’s efforts to maximize the ease and accessibility of learning about, making, and watching moving images. Every generation, it seems, attests to the fact that that *theirs* is the era in which this wistful reverie is at last realized. “A Descartes of today would already have shut himself up in his bedrooms with a 16 mm camera and some film, and would be writing his philosophy on film,” proclaims Astruc (1968, p. 19) in his often revisited “Birth of a New Avant-Garde: The *Caméra-Style*.”

As a teacher using YouTube and related digital technologies, I join with those before me like Raymond Bellour (as well as my colleagues working today on related new media investigations), who have hoped to link technology, avant-garde production, and media literacy in the name of freedom of expression: “Everything attests to the fact that video is more deeply rooted in writing than is cinema, that it gives real life to Alexandre Astruc’s prophecy hailing after the war the birth of an avant-garde he defined as the age of the pen-camera” (*caméra-style*; Bellour, 1990, p. 421).

Many of the wistful, political, populist, or creative among us have yearned to teach media production like it is in writing: cheap, accessible, common, expressive, intelligent, analytic, aesthetic – our modernist lingua franca. On YouTube, users can write about video with video if they are so directed. Students think about the meanings of images with pictures; they contemplate the reach of sounds with noises of their own; and they engage with the power of text by using typography. Just this sort of stylo dream has been fueled by multiple politics of voice: varied hopes for democratization, radicalization, or diversification of media expression allowed by the ever expanding availability of technological tools. Conjuring his related prophecy, Bellour asserts something achingly similar for the video tools of his time: “the image is

‘written,’ in varying degrees, when its preexisting matter is modulated with the aid of various machines, as well as when it is even more deliberately conceived with the aid of a graphic palette or a computer” (ibid.).

But such visions were not solely the preoccupation of 1940s French cinéastes and 1990s poststructuralist film theorists. Several authors in Grieveson and Wasson (2008) attest that, since its earliest days, academic media pedagogy has also aspired to this same stylo – a technology, a method, and an impulse that integrate making and thinking about, or with, moving images toward critical expression or toward self-expression. According to Dana Polan (2008, p. 96), from the outset, teachers of cinema knew that

film represents the synthesis of the impulses and ideas that ran through the great humanistic tradition. If the great books moved knowledge into the realm of the spirit, the fact that cinema was art requiring very practical labor – all the techniques and chores of filmmaking – meant that it causes abstract notions to be regrounded in worldly activity.

Polan introduces the 1937 project of Scott Buchanan, who invented a liberal arts curriculum for the innovative St. John’s College that would culminate with instruction in both filmmaking *and* film aesthetics. “Simultaneously an art and a set of practical techniques, cinema represented a mediation of the mental and the manual fully appropriate to the contemporary world” (ibid., p. 115). In the same anthology, Michael Zryd (2008) convincingly argues the same idealistic project for the *next* generation of media educators. He explains how experimental filmmaking of the 1960s was housed, cultivated, and encouraged via an academic film study committed to personal and sometimes radical expression. Quoting from a 1960s report on film education by O. W. Reigel, Zryd paints the film school of that era as organized for “the individualist young man, usually with a ‘literary’ (verbal) orientation, who has an urge to express his personality and ideas. In the absence of the film medium, he would probably be writing stories, novellas and poems” (ibid., p. 194).

But, these exemplary early efforts aside, I’ll suggest that, before YouTube (and related web 2.0 video technologies), there were only (or mostly) stylo dreams deferred. For reasons pragmatic, institutional, economic, and professional, to integrate the hands and the head in one media studies classroom or project proved to be the exceptional, if always glaringly obvious pedagogic project. In the mid-1980s I slunk up the elevator, renamed course credits, and lied to administrators to access the *verboden* realm of video cameras and their teachers on the 9th Floor of New York University’s Production Department – while I was earning my PhD from the scholars of Cinema Studies housed on the 6th. As continues to be true to this day for those who wish to integrate media theory and production (and perhaps activism, too), I had to write a full-length doctoral dissertation on AIDS activist video even after I had completed, in 1990, an award-winning documentary about women and AIDS, funded by the New York State Humanities Grant and widely distributed – *We Care: A Video*

for *Care Providers of People Affected by AIDS*, 1990, about which I wrote my first scholarly book, in 1995 (*AIDS TV: Identity, Community and Alternative Video*, 1995).

“The divide between ‘theory’ and ‘practice’ has often been a sharp one,” writes Gill Branston (2000, p. 24). His article is one of several attempts to answer this puzzling question about our bifurcated field, in the first section in *Reinventing Film Studies* – an anthology with a title noticeably similar to the that of the book about the history of academic film studies previously mentioned. Branston continues: “Theory, in the most distasteful extremes, [is] the haughty downlooker on practice, history, the everyday, secure in its self-proclaimed possession of totalizing accounts . . . Without such objective knowledge, it was implied, practice was benighted and ignorant” (p. 24). In the 2000 account of the discipline’s invention our pen dream is thwarted, because it is too closely related to ideological visions – visions of Russian constructivists, feminists, people of color, and Marxist politicians bent upon making things that could actually be used for social change – to be associated with a new academic field in search of institutional sanction. My own doctoral AIDS project raised just the fears that Branston suggested when I sought to bring both safer sex politics and community video-making to traditional cinema studies. Such ideological commitments to community and identity building within a social justice framework evidenced in my work are often, although not always, behind similar pedagogic projects that link media literacy and production.

So, again, outside one-offs like my own 1980s camcorder AIDS work within academic cinema studies, our techno dream awaited its moment, its machine, its real home: YouTube, the Internet, the digital – at least according to a special section of the Society for Cinema and Media Studies’ *Cinema Journal* – a section devoted to “Digital Scholarship and Pedagogy” (McPherson, 2009). Here several authors, including myself, make the now familiar case that *ours* is, at last, the moment for a radical, integrated media pedagogy; that this is the time, at long last, for *video writing*. John Hartley (2009, p. 140) begins by explaining why “knowing and doing” have been split, why our stylo has been continually deferred until now:

The tradition of modern scholarship – now some centuries old – has tended to favor the abstraction of knowledge from action in order to develop explicit rather than tacit knowledge [. . .] In the Industrial Revolution, for instance, “workers by brain” were abstracted from “workers by hand,” white collar from blue, art from artisans, design from fabrication, knowing from doing.

He ends by announcing that our age transforms media pedagogy “from representation to productivity,” where “the most important change is that the structural asymmetry between producers and consumers, experts and amateurs, writers and readers, has begun to rebalance. In principle (if not yet in practice), everyone can publish as well as ‘read’ mass media” (p. 143). While past dreamers were certain that *their* newest technology – 16 mm camera, VHS camcorder, digital Hi8 – was at last small enough, cheap enough, and user friendly enough to finally become the pen,

we attempt yet again to assert that it is our generation's *home computer* – an even cheaper machine that houses words, as well as images and sounds, cameras and microphones – that is the most real deal. In her contribution to *Cinema Journal*, Anne Friedberg (2009, p. 150) agrees, but she ends with an important challenge:

We are now able to write with the very images and sounds that we have been analyzing. But even if we have the technical ability to quote and cite and embed moving images/texts/archival documents, will every media scholar want to follow the Godardian imperative and “write” with images and sounds?¹

Well, now that you ask . . . no. Interesting: Friedberg is right! Not *every* media scholar is writing (or teaching) with images and sounds (while, of course, many are engaging in their own pedagogic projects, which “write with images and sounds.”) So why do some take this on, and others not? Currently, most scholars of media are trained in words about images and are taught that they need distance from the object we study. But, ready or trained or not, we’ve been awarded the pen, and the question is, what will we do with it? How will we teach with it? Will we write with it? And won’t our students so compose, whether we teach video writing or not? Educators have certainly begun to incorporate YouTube into their classrooms (and, since my 2007 YouTube pedagogic project, many more professors and students have experimented in migrating their studies, writing, and pedagogy to the web). However, most of contemporary YouTube pedagogy employs the site as an easily accessible archive of illustrative clips (a good use, to be sure, but a limited one). A slide show, not a pen. Interestingly, media production education has also been slow to embrace YouTube, perhaps because the vast majority of what can be found there is almost diametrically opposed to the specialized standards of form and quality that have been developed across the discipline’s history. So we still teach the tried and true way – write on paper, cherish the ink pen, make high-quality PBS documentaries, fetishize our professional quality machines – while the world outside our classrooms, including our students, flocks to amateur user-generated content.

Our students were raised within the digital, and they come to class with a digital stylo in hand: making and watching media about media every day. This they’ve learned at home through how-to videos, digital versatile disc (DVD) extras, mainstream media that mocks but also uses amateur efforts, and scores of repeatable “fan vids” (that is, fans’ name for their voluminous online practice) networked on YouTube, Facebook, and MySpace. “In this respect, the computer fulfills the promise of cinema as a visual Esperanto – a goal that pre-occupied many film artists and critics in the 1920s,” writes Lev Manovich (2001, p. 79). “Indeed, today millions of computer users communicate with each other through the same computer interface. And in contrast to cinema, where most ‘users’ are able to ‘understand’ cinematic language but not ‘speak’ it (i.e., make films), all computer users can ‘speak’ the language of the interface.” Until recently, media literacy has primarily focused on understanding the ideological underpinnings of media (how to read

it) over the practical, formal, and political concerns about how to make it, given how hard that has been.

This is why my students' efforts to understand YouTube within YouTube are so useful for proponents of a critical media literacy. Their writing on, about, and with YouTube – their banal and daily acts of “speaking the language of the interface” – can teach us how to think about instruction within and about video 2.0: an accessible tool for inscribing personal, artistic, and intellectual reflections. I will suggest that media production professors (as well as media scholars) need to embrace, not avoid, YouTube and that, in so doing, we can also work to improve it by helping to contribute to its sea of mostly mediocre and uncritical products a new stream of smart and critical student work. By expanding our teaching methods to account for this new forum as well as for the forms it supports, we can also contribute our “expert” knowledge about teaching media production in addition to the vast multitude of discourses available on the site and across the Internet. Furthermore, by encouraging our students to produce “quality” work that can also succeed under the specific parameters of the site (which are quite different from those that organize the other places where student work has typically circulated), we can affect YouTube itself, as a source of media education as well as of distribution. School-learned knowledge of the technologies, ownership, architecture, forms, and customs of the site can allow for careful, considered, and self-referential student work to become a critical part of this unruly archive.

As more and more media are produced, viewed, and distributed in the format of short, intense videos on YouTube, I will conclude that it is imperative that our students become digitally literate as readers, critics, and writers of this contemporary – and perhaps dominating – trend in new media, and that we are most qualified to teach them to write with the digital stylo, even as we must remain equipped to learn. In a world – and in a medium – where the differences between amateur and expert blur, I will hold on to my knowledge and experience as a video production professor and media scholar, even as I understand that I have much to learn from the “digital natives” of today's media, writing as they will, at last (and hopefully with the teachers' help and participation), with a YouTube stylo.

Forms of YouTube Writing

In my integrated media studies and media production course Learning from YouTube, I have been interested in participating with my students in primary research about online video.² We study (while participating in them) the forms and functions of this particular poster-child for web 2.0 by investigating digital video with video. Engaging the site together against YouTube's primary aims of entertainment, we write online, on YouTube, about the limits of its corporate architecture, as we also examine our own needs as new media makers, users, and learners. For the class, students are

required to do all their course work as either YouTube videos or comments. In the process, we rework academic writing (video serves as the only permitted format for traditional “papers”) for the digital classroom. In this section I will introduce the 10 new forms of academic video writing that my students invented or assumed in their work during the 2007 and 2008 classes: public writing, isolated writing, amateur, entertainment, reflexive and convergence writing, visual, chaotic, control, and censored writing. I will offer examples of each form from my students’ huge output of work for the course. Needless to say, describing their work on paper pales against seeing their critique of YouTube on YouTube. For this reason I have included the URLs in notes.

I developed these 10 categories while trying to systematize my students’ work, and their work came from trying to systematize YouTube. Thus my categories often point, simultaneously, both to my students’ work and to YouTube video more generally. That said, I will only look to my students’ videos, using their inventive projects to draw out the terms for effective academic communication with a YouTube pen. While each of these stylistics can be found within traditional expression through writing and through the media, I suggest that they are modified, hybridized, and amplified in my students’ online academic video writing in ways that serve to demonstrate the current state of video within web 2.0, as well as how we might best teach it. As you will see, some of these “writing forms” are focused on larger social issues (public/private, amateur/expert, for example), while others are more aesthetic and formal (reflexive, visual, and so on); and some of the terms encompass the social and pedagogic experience of the class (on YouTube and off), while others are much more focused upon understanding the aesthetics of the class’s output. Needless to say, pursuing this close and complex relationship between style and content, form and ideology is defining for my practice, for the dreams of media literacy it is founded upon, and for the course itself. Thus, as I look at my students’ writing, I will aim to raise not just the relevant aesthetic and textual issues but also the social, institutional, and political ones that writing with YouTube encompasses – including the relationship with larger questions of media architecture, ownership, industry, and power, which was brought to our attention through the process of learning from within a corporately owned social network.

There are the three overarching styles used with all 10 forms of my students’ video writing. The first is word-reliant. In this academic form, the user writes a more or less traditional paper and reads the words on to video. Notably, this variety of writing allows for the expression of the most complex meanings and for the construction of the least interesting videos. Words that travel straight from paper to video take up too much time and are too didactic for YouTube’s vernacular of speed and condensation. The powerful expressive capacity of the image is also denied. Particularly at the beginning of each semester, many of my students would read papers to the camera, or even type them as a scroll onto the screen. Next – probably the most common and arguably the most successful form for our purposes – is the illustrated summary, composed through the bullet-pointing of more detailed ideas, which are then cut to

images from YouTube as evidence. This is YouTube as PowerPoint, and it's a method of communication we are already familiar with. Here the student reads or writes a list of short ideas and uses YouTube videos to illustrate them. Finally – perhaps my favorite, and certainly the most creative form – is the YouTube hack, where academic content is wedged into a popular YouTube vernacular mode, making its argument through an integrated approach, which occurs in both form and content. An example would be a video about advertisements on YouTube, expressed through the form of a popular YouTube advertisement. Beside these common formats, I also note the ubiquitous use of two more common tones and structures across my students' 10 forms of writing: parodic humor and self-reflexivity. Given the ubiquity of these two approaches, my students will still sometimes pull the unexpected power play of sincerity, which creates productive tension with YouTube's expected cynicism, humor, and self-reflexivity, and does so in ways that define the site.

Public Writing

- ALEX JUHASZ: We're recording! If you don't want to be seen on YouTube for this class, you should know we're recording, so you might want to be behind this area over here. You're going to be on all semester.
- STUDENT: It's so awkward.
- JUHASZ: You're in the shot.
- STUDENT: I know!

(Learning from YouTube: September 4, 2007, Pt. 1)³

Web 2.0 technology has altered human behavior, interaction, and communication in more ways than I can introduce here. Of greatest relevance to this consideration, however, is one particular and much noted phenomenon: the digital's influence upon the increasingly open nature of private life. On Facebook, YouTube, and the like users ubiquitously and unflinchingly post for social scrutiny images from the realm of home and family, once thought to be private. In his book on YouTube, Michael Strangelove (2009, p. 33) explains: "Whereas much of the home movie-making of the analog era was guided by a desire among filmmakers to show themselves to themselves, we now stand witness to a growing compulsion among online videographers to show themselves to the world." However, as publicity-seeking YouTubers readily make use of the recognizable, tried and true do-it-yourself (DIY) forms of home movies or family snapshots, things change when their new practices modify these forms' traditional locale. On YouTube, conventions for both the content and the use of the home movie have changed. Strangelove clarifies the differences: "The home movies of the 1970s generally did not focus on unfamiliar people, death, arguments, use of the bathroom, vomiting, and sexual intercourse" (p. 29).

On YouTube, home users train their camcorders on people, activities, and behaviors that used to fall off the radar of the permissibly visible: on parental drinking and

fighting, on soldiers' views of war zones and abuse against civilians, on the internal life of college classrooms. When the private becomes public, the focus of students' work also adapts. "In the hands of teenagers the camera becomes a tool for rebellious and transgressive behavior" (p. 49). In this vein, many of my students gladly show themselves and their peers on YouTube in compromised positions: under the influence of drugs or alcohol, engaged in sexual flirtation, titillation, or interaction. For instance, in "Picture of America (Hilarious Drunk College Students)," by CollegeKnowledge,⁴ my students ironically suggest that the "Future of America" will be in the hands of drunken college students: "What would you do if you were president?" "Legalize marijuana, end the war in Iraq, subsidize the refining of glass." While student video-makers have always pushed envelopes of propriety, this used to be visible only within the small community of the classroom. How does this radical public openness affect the teaching of video?

Usually (or at least ideally), the exclusive liberal arts classroom where I work depends upon an intimate and "safe" gathering of high-paying (or scholarship receiving) and carefully selected students to create a communal pedagogy. In my typical Pitzer College classroom, once the doors are closed, students are asked to contribute their interpretations and sometimes personal experience or knowledge to the class community, being always aware that they are not professionals but are certainly experts in training. Students, often feeling vulnerable in the eyes of their classmates and of their esteemed professor, are challenged to add their voices to the building dialogue – one in which they are active, continuing members. Meanwhile, aware of the power dynamics that structure the classroom by allowing some to speak with comfort and others not, I engage in strategies designed to alter the "safety" of the space. After leaving the classroom, students write for the professor, and sometimes to each other; but the general public is neither their audience nor their critic. The classroom's privacy and possibilities for mutuality encourage the development of a voice.

In this dynamic it is odd for a professor to make *her* work public. And yet I began this class – planning for its structure to imitate my understanding of YouTube's – with a press release. Picked up by a local newspaper (as I anticipated it might), this went onto the Associated Press (AP) wire (which I did not anticipate), and then the course was covered in print, radio, television, and across the Internet for about two wild weeks. While initially thrilled by such media exposure, the students quickly tired of the mainstream and digital media, which, while quick to judge, were astoundingly superficial in their coverage. Needless to say, lofty (and time-trusted) pedagogic dynamics shift when the world can see – and also participate in – the work of classroom learning. What does it mean to ask a novice to learn in public, or for a teacher to do the same? When students "write" on YouTube, their efforts at developing a voice are open to public scrutiny and to YouTube's sandlot culture. Many viewers of my students' (first) videos responded with nasty comments telling them to "learn to use a tripod" – not to mention the ubiquitous personal attacks, which were almost uniformly made against women, people of color, or those perceived to be gay or lesbian simply on account of the act of speaking as themselves, visibly on the site.

While making the class and its assignments publicly available serves to increase access to higher education and expands the limited participation within any brick and mortar classroom, it is vital to note how the disciplining structures that safeguard and control learning in a closed classroom – or a paper written for course work that will circulate privately between teacher and student – no longer function. In their absence, such confinements become both surprisingly visible and unusually desirable to students. For instance, the compact (and grades) of a closed classroom insure that all student participants are (relatively) committed and attentive. This is unenforceable in a YouTube classroom. Given these conditions, it was fascinating to see my students bent upon re-establishing the privacy of their classroom by using YouTube to create protected group pages, for instance, thereby holding out the curious and insulting public that I had initially invited in. This is only the first example of their efforts to bring discipline to a class where I had given it away, in my efforts to expand their voice and control in ways that I thought were mirroring the user-generated platform we were studying.

Thus this new public video writing demands that the YouTube professor make central to her teaching considerations of control, sexism, voyeurism, censorship, and self-censorship. America's definitive structures of public and private, profit and non-profit education also come to the fore, which allows for a meta-focus upon how the systems of higher education at large, and the college classroom more specifically, organize and control both student output and teachers' attention.

Isolated Writing

In "MS130 Want Some High School Musical 3? Watch till the End!"⁵ the student video-maker whose YouTube user-name is ziliemd begins with the inter-title "3 steps to become a YouTube Guru! Nov 2008 . . . Input: an ordinary guy . . . And the transformation begins . . ." We watch as this mild-mannered Chinese college student, in classic to-the-camera, video blog (vblog) shot, begins his online presence, then, cut to "step 1," he takes on costumes and attitude, seeking more fame and attention, and, cut to "step 2," adds "entertainment elements," lip synching with a friend, to elevate the fun even as the class assignment is to do the serious work of explaining the academic book *Serious Leisure* (Robert Stebbins, 2006). Thus ziliemd expertly produces in video form the kinds of practices that Stebbins introduces in writing.

In same-time counterdistinction and close connection to the public writing mentioned above, much YouTube writing, while openly presented to the YouTube public, is produced in and about isolation and in the hopes of finding community. The lone and lonely individual speaking to the computer camera in her bedroom – the video blog – is a definitive form of the medium. While it is highly debated (on YouTube and off) whether networked pleas for friends through the expressions of the individual and unique self can produce the desired effects of community's sustained interaction, recognition, mutuality, shared goals, and connection, it is clear that a

great many YouTubers write videos from the seclusion (and safety) of home and with some hopes of departing this place: whether this be to find fame or simply a friend. What does this portend for the teaching of YouTube writing?

Interestingly, the voice of the written text (like mine here) is typically not particularly self-conscious about its solo status (why, oh why, am I typing here alone . . . woe is me). Meanwhile, the solo YouTube writer is visually framed as a face alone, in the private sphere, and is just as often verbally preoccupied with her isolated condition. In “MS130 Want Some High School Musical 3? Watch till the End!” ziliemd literally adds a friend to his second and third shots, to reflect visually (and to increase it, because the shot is more interesting) the possibility of making friends, or at least of having more viewers. While writing with the intention of self-expression is as defining for the written medium as it is for the vlog, it is the purpose (and possibility) of actually interacting with others eventually, in almost real time – although often in less than real space – that most distinguishes these various writing forms. And yet, counterintuitively, a good deal of isolated YouTube video seems to be meaningless, silly, or egotistical ruminations on self – hardly a calling card for further interpersonal interaction. Interestingly, video art, too, has been long censured for being a “narcissistic” mode: a technological mirror allowing the self to interact solely with itself, in an endless loop of absorption and fascination. On YouTube we merely see a democratization of this effect. “The biggest content category is occupied by the ‘ego clips,’” writes Bridgit Richard (2008, p. 145) in the first anthology of critical essays on YouTube. “They excessively serve the narcissistic self representation of the users. In this category a wide range from shy monologues to visual self-prostitution are [sic] to be found.”

Of course, as is often true for YouTube, the reverse of narcissism is equally defining for its forms: the lonely video-maker looking outward, making sincere and humble stabs at communication, a lone voice waiting for recognition in the wilds of the internet. While the lucky few do break out to be heard around the world (as our class did), most YouTube videos suffer from “NicheTube’s” guarantee that no one will actually find, see, or hear you in the uncharted and unruly sea of similarly useless attempts at communication and self-expression. Given YouTube’s reliance on votes, ranking, and other forms of popularity engineered through its search and rating functions, the random thoughts of lonely girls usually go unfound and unheard. Thus, isolated video writing demands that the YouTube professor make central to her teaching considerations of self-expression and community, particularly within a corporately run architecture that allows for the most outlandish to have the best chances to be seen.

Amateur Writing

In one long take, shot in a dorm room, with a white board sloppily tipped against the wall behind him we see a student who says: “This is my video post: what can YouTube teach us? [. . .] I will do some teaching of my own. I’ll teach you a little about myself

in a segment I call '5 things about Ben!' This is the '5 things about Ben board.' We'll begin with 'V-card.' I lost my virginity at 16. I'm not sure that's appropriate but I'll go with it."

(What YouTube Can Teach Us: bhecht84)⁶

The vblog is a hallmark of YouTube and a seal of amateur writing: a word-reliant format that uses the author's computer or other home devices to capture her talking in something close to real time, most often about herself (see isolated writing). Visibly (and aurally), the media production of a lay person who makes the most of consumer technology, the guarantees of production expertise, or a college education in media production (careful lighting, clear and complex sound, artful framing, story management and development) are lacking – by definition, and even by design. While bhecht84 has the skills and education to make artful ruminations for his other classes, for Learning from YouTube he produced the intentionally messy "What YouTube Can Teach Us," because his use of "bad" form permits his use of "bad" taste (see public writing); all of this comments, via form, on his understanding that YouTube loves how people talk about their inane and trivial private experiences: "I lost my virginity at 16."

Amateur writing is the easily recorded, unedited words of real people talking into their low-end cameras about their private pleasure or pain, or perhaps demonstrating their exceptional or laughable skills. Everything they *don't do* marks the veracity of the form. On YouTube "crude is cool, as opposed to slick" (Sherman, 2008, p. 162). The bad but cool video of YouTube holds itself in direct opposition to the hot and professional, the other most common vernacular of the site. In the media production classroom we teach video-making *en route* to professional standards and methods: an expensive, collaborative, skilled practice where form is either transparent or carefully figured. This is the antithesis of the developing YouTube vernacular where

[t]he use of canned music will prevail. Recombinant work will be more and more common. Collage, montage and the quick-and-dirty efficiency of recombinant forms are driven by the romantic, Robin Hood-like efforts of the copyleft movement. Real-time, on-the-fly voiceovers will replace scripted narratives. Personal, on-site journalism and video diaries will proliferate. On-screen text will be visually dynamic, but semantically crude. Crude animation will be mixed with crude behavior. Slick animation takes time and money. (Ibid., p. 161)

Amateur writing celebrates and foregrounds its formal inadequacies. In this way YouTube is not really a level playing field. By reifying the distinctions between the amateur and the professional, the personal and the social, the bad and good, in both form and content, YouTube maintains (not democratizes, as it insistently proclaims) distinctions about who really owns culture even as more people can make it. In the meantime, amateur writing has itself become a legitimate form of dominant video production. Contemporary corporate media often fakes amateurism in hopes of gaining what amateur video is thought to hold: authenticity, individuality, realness.

“The misleading ‘ideology of authenticity’ as a cultural consensus is based on the poor quality of the recording tools with their low resolution, as well as the presentation in small windows on the computer screen, which conspire to create ‘a look of everyday life’” (Richard, 2008, p. 143). When students self-consciously use or mimic this convention (as bhect84 did so artfully), it carries this (short) history of meanings and customs.

Thus this new, amateur video writing demands that the YouTube professor make central to her teaching considerations of the relations between both professional skills and thought-through simplicity, as well as how these forms are used in relation to open-ended questions of personal authenticity and corporate legitimacy. Teaching amateur writing within the history (and changing standards) of DIY media forms is a good place to start, putting demands on the students to speak to each other in this way: exacerbating and highlighting difference and status (of women, foreign students, or working class students) who must speak as themselves, even if their vernaculars and homes mark disparities.

Entertainment Writing

“Gimme gimme more,” sings Britney Spears, as this song comes up for sale from iTunes at the bottom of a YouTube video where a male and female student wear outlandish wigs and sunglasses while gorging themselves on buckets of chicken, handfuls of burritos, and shopping carts full of chips, junk food and candy. Britney sings her refrain, “Gimme gimme more,” while the videomakers enact and then reverse their gluttony and purge all they have digested. The pop music track stops briefly, only at video’s end, as we see a car full of these hungry fast food junkies, and our male lead says to the intercom: “Can you give me more special sauce? Can you give me ketchup and mustard? Can you give me a napkin? Can you give me pepper?”

(Britney Spears Uncensored Dancing and Eating: jweitzel)⁷

Today’s middle-class students, schooled at home (and on the road!) on YouTube, iPhones, and Britney Spears (“gimme more”), want *more* information relayed with *more* ease and fun and plentitude; they want it pleasurable, simplified, and hilarious. They don’t want to be bored, even as they are always distracted. On YouTube, the rule is to be entertained with video, and more of it! This occurs through forms that are readily accessible, short, and easily identifiable: like pop songs. There should be no work expended to “get” a video. Thus entertainment writing is often both about, and made with, the ripped or imitated forms of already recognizable mainstream (or YouTube) media. It is writing about and through dominant diversions. It can also take up the amateur forms of comedy or spectacle, which celebrates or parodies the exceptional or standard behaviors of real people (like YouTuber jweitzel’s vomiting chicken) or pop stars. The point is to laugh, feel, and recognize – quickly and with a punch. My students’ video, relying as it does upon the song as well as upon the persona of Britney Spears, uses her highly recognizable work to provide a short-hand into their critique of consumer pop culture. The artists themselves say almost

nothing; and we get it immediately. In his contribution to the *Video Vortex Reader*, video artist and writer Tom Sherman prophesizes what I call *entertainment writing*: “Extreme sports, sex, self-mutilation and drug overdoses will mix with disaster culture; terrorist attacks, plane crashes, hurricanes and tornadoes will be translated into mediated horror through vernacular video” (Sherman, 2008, p. 162). The bulimic dance of jweitzel is exactly Sherman’s extreme.

Schooled as they are, contemporary students believe that even college should speak in this extremely entertaining language, which they already like and know and deserve. A good professor makes “hard” information understandable, palatable. While I have always been aware that I am a performer, I feel this to an unparalleled degree when I teach or write on YouTube. There I need to be quick and forceful, condensing my ideas into slogans: bite-size morsels of edification that are easily regurgitable. YouTube is not a place for the complex, deep, slow, or hard – which was once understood to structure the life of the mind, the work of the artist, the experience of the counterculture, the ways of the classroom. While students have often taken pleasure in the rigorous work of learning, entertainment writing is not founded on such delectations. Rather it feeds upon YouTube’s staple ease, plentitude, and self-referentiality. Thus entertainment video writing demands that the YouTube professor make central to her teaching considerations of the easy and ready pleasures of the expected, comfortable, and consumable as well as of how easy these are to eliminate.

Reflexive Writing

Using only still frame grabs of the site as visuals, we hear this commentary: “YouTube provides a prime example of how the content that we as a society create is shaped largely by the forms and rules of the medium that we use to share this content. For instance, the restricted comment length and poor archiving features for YouTube comments has contributed to the prevalence of short, often inflammatory comments . . . Decisions made at the corporate level for purely capitalistic reasons effect the medium in terms of content that appears on the website.”

(What Can YouTube Teach Us? baxteric1)⁸

Videos about two things – about YouTube videos and about corporate entertainment media – have become the hallmark of YouTube. Making such videos is reflexive writing. But this kind of writing is also entertainment writing, because it is almost always fun, in a postmodern way . . . It makes YouTube its content as well as its form and method – since, as I’ve already established, a significant amount of the content and form of YouTube is entertainment. This creates a dizzying hall of media mirrors – videos quoting, mashing, and copying other videos – and then, as in all things reflexive, there are two possible results. The first is heightened self-knowledge; the second is an abyss of unknowing. These binaries (like most others) coexist on YouTube and have a mutual influence. Knowing more about YouTube allows for an

awareness of its common state of unknowing, itself a form of cynical and cyclical entertainment.

Many YouTube videos take YouTube as their subject: for instance its community, or rules, or censorship. YouTubers contribute to all manners of video studies about the site, using other videos as both evidence and substance. My students' course work for "Learning from YouTube" is a prime example of this tendency: the site holds their videos, which are its critique, built from other YouTube videos; and these are then covered by other media or YouTubers, and those stories are ripped and put back onto YouTube, where users respond again. Even in our case (an example that starts with YouTube reflexivity and leads to self-knowledge), we see how quickly "the real" dissolves into nothing more than an awareness of YouTube's knowledge of itself alone. We fall into an abyss where YouTube refers back to nothing but itself, and we are part of this loss or transformation. We become a necessary but unmissed casualty to a richer and endlessly self-referential and self-fulfilling life online. Thus this new and reflexive video writing demands that the YouTube professor make central to her teaching considerations of the real in relation to the ready pleasures of its loss, while also helping students to understand the (artificial) limits of the site and of the media it holds.

Convergence Writing

We see images ripped from the internet over which text reads: "How does YouTube function within other webmedia? Example: Googlemaps. Users can create content like pictures and video. Here's what I found when I typed in Japan." We see stills of cherry blossoms, a subway map, a sports car, and a neon-lit street. "It's still hard to connect information and create real dialogue or learning, especially because you can find things like this . . . " We see a YouTube video of a baby singing "Hey Jude" with a guitar in hand.

(YouTube in Context: kimballzen)⁹

Convergence writing is a more mobile and adaptable form of reflexive writing. As Henry Jenkins (2006) points out, the new media allow for expression that gains in impact by moving across platforms while building upon the power of ready-made memes already encrusted with meaning (and ownership). Convergence writing moves on and off YouTube quickly and sometimes virally, picking up other forms, just as a snowball does: subway map, "Hey Jude." While Jenkins argues for the revolutionary power of this rapid and free movement, after reading him and also researching on YouTube, my students and I were less sure; see kimballzen's comment that connection, dialogue, and learning are less easy to secure than the accumulation of user-added stuff. Thus convergence video writing demands that the YouTube professor make central to her teaching considerations of the many sites, forms, and languages of new media, particularly as students make their YouTube writing about

other forms of writing (*Star Wars* yields the fan fiction that is the subject of “Media Convergence *Star Wars* Fan Fiction,” written by my student, wtto2005;¹⁰ there wtto2005 looks at fan fiction.net and discovers on its *Star Wars* page that, while there are 795 pages of fan fiction, one finds only 56 pages through ratings).

Visual Writing

Over one quickly edited minute and covering the Avril Lavigne’s hit “Girlfriend” we see video of: cute kitten, a train ride, women mud wrestling, the Girlfriend music video, a baby laughing, a unicorn animation, and some Soulja Boy dance instruction. The video concludes with text: “YouTube is changing society and now society is changing for YouTube, have we been tricked?”

(Everything People Love about YouTube: edauenhauer)¹¹

Visual writing depends on images linked through rhythm and related sounds. “Hey hey, you you, I don’t want your girlfriend” plus cute kitten. It does not depend upon written words, as the writing of old did. “Hey hey, you you, I know that you like me” plus train. Its 500-character limit and sandlot culture produce a dumbing down for the written word that is structurally impossible to remedy. “Hey hey, you you, I could be your girlfriend” plus mud wrestling. Here the limits of the site’s architecture hit against its corporate conditions: songs and beats, the more popular and recognizable the better to hear you with (plus baby laughing). So the way to be heard on YouTube is through video (music video). Being another category of entertainment and reflexive writing, this style banks upon the amusing stylistics of montage, appropriation, and parody. Meaning is quickly lost to feelings that are buttressed by the sound of music and cut to the speed of Final Cut Pro (or other home editing software, including YouTube’s). What “people love about YouTube” is how easy it is to make and see and understand. Relying both on spectacle and on humor, visual writing is also, counterintuitively, the terrain of the expert; for it is highly dependent upon corporate popular media, even (or especially) as modified by “amateurs.” Corporate videos express ideas about the products of mainstream culture in the music-driven, quickly edited, glossy lingo of music videos and commercials. They consolidate ideas into icons – which are often things to buy, like pop songs. “The current environment favors messaging, the propagation of short, direct, functional messages,” writes Sherman (2008, p. 166). Importantly, this has real effects on the kinds of culture we see. He continues: “the characteristics of poetic art, ambiguity and abstraction, are not particularly useful in a messaging culture.”

Understandably, visual writing is the most difficult form to use in academic video writing, but students try, usually through opposition, producing image-laden, inexplicably speedy montages that mean nothing, except that this meaningless linking (cat to train to wrestling) is how we mean on YouTube. Of course, this is in direct opposition to the vblog, where communication occurs through real-time words and where image

quality is basically insignificant. This new, visual video writing demands that the YouTube professor make central to her teaching considerations of the power of the written (and even spoken) word in relation to the ready pleasures of its absence.

Chaotic Writing

Almost impossible to describe, it's so quick (7 seconds!) and strange, to a techno beat we see: a guy dancing, a cat super-imposed and spun, a super-hero placed onto that, the guy with a walrus mask on his head and the words "do we want more from youtube?" flashed at the end.

(Worst Movie Ever Made: baxteric1)¹²

Ideally, the college classroom and its writing requirements are disciplined spaces and practices where knowledge moves in a formal and structured routine, familiar to all players. While the critical classroom begins to alter this script by giving more power to students and by allowing knowledge to be created dynamically, this is neither the random chaos of information nor the hidden controls of YouTube. *Chaotic writing* knows it will be lost (because it isn't any good, no one will watch it, and it will remain unranked and thus unseen); it tries to reach for meaninglessness, and perhaps randomly – if reflexively – it links to other meaningless writing, to which it has almost no deducible connection. It either celebrates YouTube's unstructured archive or is confused by it; or it confuses us – or it clarifies that confusion. Unknowing and pleasure are the point.

However, for effective education (and communication), structure remains paramount: to manage conversation; to allow ideas to build in succession, permitting things to grow steadily more complex; and to be able to find things once and then again, so as to link them, map them, and experience them more than once and also communally. Again, the significance of discipline within the academic setting tests the rule. Without it ideas stay vague, dispersed, and random – if fun (or funny). There is no system of evaluation and you can't find things or build upon them. Chaotic writing laughs at education in the name of entertainment; it celebrates the waning of meaning and the spiraling out of control of signification. It is either celebratory or anguished, and usually it is both: "Do we want more from YouTube?" This new, chaotic video writing demands that the YouTube professor make central to her teaching considerations of the random and the structured, the euphoric and the forlorn.

Control Writing

In this video, I speak to my computer, sitting in my office, as I read a list of twelve reasons why it is hard to learn from YouTube over two minutes of real-time video.

(Summary of Learning from YouTube at the Midterm 2: MediaPraxisMe)¹³

Control writing works against, and in response to, the previously mentioned chaotic, undisciplined culture of YouTube and attempts instead to force structure and the possibility of building complexity into its pages. It attempts to map or connect work, while making the most of YouTube's weak architecture – a web 2.0 environment that disallows most of what we expect on the web: linking, versioning, tagging, saving. Control writing strives to organize its own visibility, legibility, and linkability through the rigorous, theorized production of titles, tags, and networked promotion. It tries to understand the mechanisms, rules, and forms of YouTube so as to better direct these toward comprehension. Otherwise ideas stay vague and dispersed, there is no system of evaluation, and you can't find things or build upon them. Categories and order allow for discipline, which may punish or provide elegance, or both. This new, control video writing demands that the YouTube professor make central to her teaching considerations of discipline and structure, as well as their absence. YouTube separates the artist from the user. "Artists must pick up on the everyday forms of videos, but move beyond this. Artists must identify, categorize and order the various strata of everyday videos by using an appropriate video language to interact with the world effectively and with a certain elegance" (Tollman, 2007, p. 170). Here the professor gains and loses control as she attempts to question how the rules of traditional academic writing and video production do and do not translate into work penned through a video stylo.

Censored and Copyright Writing

To see "Blacks on Youtube Final," by VannaBlack4u,¹⁴ a research project on whether empowering or positive images of black people are ever popular on the site, you have to authorize that you are of age. This is because it has been flagged by users as being inappropriate for younger audiences. Many videos by my students have been taken down because they used songs owned by the music industry, while others still are gone for reasons of self-censorship: maybe the students didn't want their sophomoric efforts visible to you (or me).

Censored and copyright writing are corporate varieties of control and/or chaotic writing (it's all so confusing!) and are definitive of YouTube (usually heralded as a "democratic" platform). Content is built upon a promise of free expression; users nevertheless routinely flag it, servicing the corporation, whenever ideas stray from the comfortable confines of the hegemonic. "How do you find Black people on YouTube?" VannaBlack4u asks. Simple: "by SEARCHING for terms like Fight, Babymomma, Bitch, Ass, Trick, Ho." While sexual and violent images are easily found across the site, both ideological and corporately owned content are quickly lost. Then YouTube itself commonly censors content through a system of rules and procedures that are both opaque and shifting. Thus this new form of video writing – censored and copyright writing – demands that the YouTube professor make central to her teaching

considerations of voicelessness in the face of corporate control, a political theme that permeates all the previous categories. And here again the corporate architecture of the site creates and controls user behavior and access to information.

Stylo Dreams Deferred

If one wishes to be part of the twenty-first-century, media-saturated world and wants to communicate effectively with others or express one's position on current affairs in considerable detail, with which technology would one chose to do so, digital video or a pencil?

(Sherman, 2008, p. 163)

A pencil? YouTube is a corporately owned, highly structured domain that allows average users to write beyond the reach of a pencil with networked video. While infinitely more visible, their writing is also always circumscribed by capital, hegemonic ideology and by dominant media. If the pen or pencil is cheap and easily bought at the mall or online, but if it does not come with a teacher, we learn from YouTube that it will predominantly be used to mimic familiar forms, not to challenge them. We learn that, while everyone can be a writer, not all users will be “masters”:

The media-master is characterized through technical expertise and perfection, and has special skills relating to the medium and its structure. [. . .] Seen from the point of view of the art system of fine arts, the amateur normally represents the infantile, naïve and unreflected, almost too perfect imagery, that is generated through visual stereotypes or motifs of popular culture [. . .] Most YouTube-uploaders do not intend to establish or implement a new art form or aesthetic. (Richard, 2008, p. 150)

The dream was never simply to write, but to do so with a view to a better, integrated, and original aesthetics of the now, of the self, and of the self-aware. Contemporary digital video writers, like my students, armed with their pen and enabled by YouTube, also need digital video teachers who will work with them to produce video writing that integrates history, aesthetics, analysis, and control to truly fulfill this perennial dream of visibility, expression, and everyday communication and expression.

NOTES

- 1 Friedberg is referring to Jean-Luc Godard's reference to film critic Alexandre Astruc.
- 2 My YouTube page about the teaching of this class is at <http://www.youtube.com/MediaPraxisme>. A “video-book” about these efforts was “published” by MIT Press in 2012 as well; it can be found at <http://mitpress.mit.edu/catalog/author/default.asp?aid=38947>.

- 3 I will give the title, author and universal resource locator (URL) for each of the course videos I discuss, but obviously the best way to write about YouTube video is online, at <http://www.youtube.com/watch?v=8CDrYwXVOn4>

Queer Broadcasts

Backstage Television, Insider Material, and Media Producers

Quinn Miller

ABSTRACT

This chapter outlines critical tools for examining queer elements of production manifest in comedy texts. Building on the basics of queer theory and scholarship on camp, it reviews a set of methods for queer analysis of production details appearing in quasi-fictional television programs about the entertainment business. Referencing examples from US series, it employs the terms “insider,” “camp,” and “queer” to demonstrate how scholars can extract historical evidence about the industry from images of television production. The chapter considers the industrial, intertextual, and social dynamics that have contributed to the queer content evident in TV culture by looking at backstage series that represent queer work as an obvious aspect of the media industries as a whole, rather than as something specific to gender and sexual minorities. It argues that we can better understand the creation of queer media by analyzing satirical depictions of the production process.

In June 2011 Tina Fey, the creator of *30 Rock* – a National Broadcasting Corporation (NBC, 2006–) sitcom about a fictional NBC sketch show – issued a public statement following press coverage of an allegedly homophobic stand-up routine that one of her actors performed in a comedy club. Taking a “we are everywhere” approach shared by radical queer activists and more moderate campaigners for lesbian, gay, bisexual, and

transgender (LGBT) rights, Fey, who also stars in the show, stated that, without their “gay and lesbian coworkers at *30 Rock*,” she and her colleague, Tracy Morgan, “would not have lines to say, clothes to wear, sets to stand on, scene partners to act with, or a printed-out paycheck from accounting[. . .]” (Hibberd, 2011). This official acknowledgment of queer workers on a comedy series may be a first in the business. However, more informal shout-outs to queer labor behind the scenes of television productions have been part of satirical backstage comedies such as *30 Rock* since programming began. These series, which are set in show business and populated by fictional industry personnel, suggest the importance of using queer methods to study media production. The term “queer” indicates a set of interpretative practices partially at odds with the dominant gender/sexual system – as well as with other ideological frameworks – and provides needed leverage for addressing many people’s lived experiences.

Scholars often assume that media texts mask the production process, while they see the content of these texts as self-evident. A queer perspective on backstage TV points out that this relationship can be inverted. Comedy series that represent the television industry satirically carry evidence of actual production cultures. This evidence illuminates queer content that is seldom acknowledged. In this chapter I discuss some of the critical tools available for examining queer elements of production manifest in broadcast texts, and I do so without regard for the personal lives (that is, for the sexual identity or sexual history) of the people involved. While it can be useful to investigate the experiences and artistic expressions of the many self-identified LGBT people who have worked as television producers over the years, it is also important to consider the industrial, intertextual, and social dynamics that have contributed to the queer content evident in TV culture. Below, I build on the basics of queer theory and scholarship on camp to outline a set of methods for a queer analysis of the production details that appear in fictional television programs. With reference to relatively successful US series, I elaborate these methods through the terms “insider,” “camp,” and “queer.” I include a brief close reading of *30 Rock*, one of the premier backstage satires of the 2000s, to demonstrate how scholars can extract historical evidence about the industry from fictional texts about television production. Backstage series represent queer work as an obvious aspect of the media industries as a whole, rather than as something specific to gender and sexual minorities. I argue that we can better understand the creation of queer media by analyzing texts about the production process than by attempting to pinpoint individual LGBT producers as proof of queer content.

There are no hard and fast rules for how onscreen comedy relates to people situated at social peripheries, or for how an “insider” view relates to the reality of the industry. However, in looking at backstage programs, we can see patterns in the way these texts mediate between representation, history, and the industry’s heteronormative limits. In the case of television, queer content can be present when neither the characters nor the actors who play them are necessarily themselves queer. At the same time, this content links up with a diffuse realm of queer labor. The discussion below addresses a production subculture centralized in the US, which has a transna-

tional history in terms of personnel and circulation. It may have parallels and counterparts in other national contexts, as well as possible compatriots on a global scale. In one episode of the Home Box Office/British Broadcasting Corporation (HBO/BBC) quasi-documentary series *Extras* (2005), for example, Ian McKellen, an internationally recognized actor and prominent mainstream LGBT rights activist in England, casts Andy Millman (Ricky Gervais), a sitcom star, in a gay play after McKellen describes his preparation for *The Lord of the Rings*, a Hollywood franchise filmed in New Zealand. While the present chapter focuses on a specific subgenre of television, insight into the collaborative dynamics that arise in relation to the production of TV comedy can serve as a model for readers interested in other formats, genres, and media industries. Even within television, insider material turns a satirical eye on many different production cultures around Hollywood, including those related to film, music, dance, design, software, advertising, publicity, and other media arts. While I focus on television's representations of itself and on its producers, backstage series shed light on queer elements in a variety of production traditions. My study suggests that investigations of divergent threads and subgenres in different media can contribute to the recovery of queer histories at a level beyond traditional accounts of production studies and the conventional politics of representation. Exploring how these histories intersect is an essential step in understanding the full weight of queer media history.

Production Studies, Expanded

The US television industry has generated many satirical backstage series since its inception, such as the variety programs of Ed Wynn, Milton Berle, Burns and Allen, Ernie Kovacs, and Jack Benny; *Where's Raymond?* (ABC, 1953–1954), *The Bob Cummings Show* (NBC, 1955–1959), and *Mr. Adams and Eve* (CBS, 1957–1958); *The Dick Van Dyke Show* (CBS, 1961–1966), *Seinfeld* (NBC, 1989–1998), and *The Larry Sanders Show* (HBO, 1992–1998); *Curb Your Enthusiasm* (HBO, 2000–), *Joey* (NBC, 2004–2006), *The Comeback* (HBO, 2005), *The Starter Wife* (USA, 2008–2009), and *Californication* (HBO, 2007–). Programs about media producers feature aspects of industry jobs that usually remain outside the limelight, portraying meetings in the writers' room of a series, for example, or the activities of a talk-show host during commercials. The backstage subgenre calls for methods of study focused on queer forms and meanings as well as on queer characters and producers. Integrating queer studies with media production studies more fully offers an opportunity to expand the field's critique of production cultures and the representations they make. In the case of queer media studies, this entails seeking an understanding of queer representation beyond the scope of figures that are gay, lesbian, bisexual, pansexual, and so on – be they characters, performers, writers, or directors.

Queer production is evident throughout the history of television comedy in various elements of queer gender, queer sexuality, and queer culture. The phrase

“queer gender” refers to expressions and styles of gender that question or critique universalized sex, gender, and sexuality categories, or show no interest in upholding them. One principal way this attitude appears in television programming is through rejections, ironic inflections, and transpositions of supposedly natural gender norms, including attraction to the so-called opposite sex. In the context of most culture industries, first censors and then scholars quite systematically omit queer elements from a variety of media texts. The queer elements that scholars overlook, which have survived censorship, often take the form of implicit references to the actual production process. I discuss this set of evidence as “insider material.” In the context of US culture industries, insider material concerns, at its broadest level, the way the politics of representation plays out in a free-market economy disinclined from protecting minority groups. Encompassing a mass of queer content that congregates in seemingly minor details, insider material offers traces of queer media production that are independent of the purported sexual identities or sex practices of their producers, as well as of those of the fictional insider characters that breathe life into these traces. Capturing queer content distinct from sexual categories is important for the recovery of queer history. Historians often presume to find proof of queer representation in sexual categories, but queer representation actually resists the idea of a point of origin in identity, and many aspects of industry life that are not particularly queer – as in LGBT – contribute to production contexts and texts that are queer in other ways.

Self-reflexive attention to the social spaces in which the people who produce media interact with one another may seem superfluous compared to factual accounts of production practices. However, comic acknowledgments of alternate TV histories within programming texts connect to actual industry contexts and are crucial for capturing characteristics of production cultures that are necessary for understanding queer representation. Insider material illuminates a tradition of experiences adjacent to dominant norms, which are too often subsumed within a single, universal narrative. As Lynn Spigel (2001, p. 22) writes, “media have numerous histories through which they were imagined and used by different groups.” Through a study of Hollywood film criticism, Chon Noriega (1990) has shown that people often project onto the past the notion of a “monolithic anti-homosexual” climate that is not historically accurate. Even though documentable queer representation proliferated long before the contemporary era of commercialized LGBT representation, scholars regularly assume that “historical evidence and homosexual ‘images’ either do not exist or were censored” (ibid., p. 21). Whether historians assume that references to queer people and queer culture would have been unthinkable or would have been inevitably censored, queer facets of broadcast texts fall disproportionately by the wayside.

Attention to media production on screen makes visible a world of queer content that in turn illuminates production cultures backstage. The insider material that appears throughout US TV programming, much of which occurs at a level of detail rarely included within the scope of TV scholars’ objects of study, channels an intan-

gible aspect of the medium's history of production. Media producers can recall elements of their everyday lives; but, even when peppered with anecdotes, these retellings will always be filtered through narratives centered on "bigger" issues. Bringing queer methods to bear on insider material allows historians to capture a production tradition with a unique structure of feeling around industry hierarchies, comic sensibilities, sexual experiences, and queer gender. Despite enormous changes in the television landscape brought on by shifts in technology, demographics, and delivery systems, insider material cuts across the industry's history. Insider material is evidence not merely of a secondary queer history, but of television history itself. A consistent set of risqué backstage comedies recognized as important contributors to TV history have also made important contributions to queer history through their presentation of insider material.

With insider material, producers refer to television production in the present moment and in earlier periods. These types of reference defamiliarize US TV history, opening up past production cultures for re-examination. In addition to insights into the context of production as it existed at the specific moment when a media product was made, seemingly inconsequential moments of programming transmit a vast realm of showbiz knowledge, which is oriented toward the industry's own history. Backstage comedies regularly depict unconventional gender relations, idiosyncratic gender presentations, and coded frankness about non-normative sex practices and sexual identities. I discuss this material under the label "queer" because it defies boundaries related to gender and sexual norms, and it does so in ways that relate to historical queer cultures established beyond the limits of dominant media representation. When backstage series feature insider styles of comedy, they often represent queerness as a primary characteristic of the entertainment industry, recapturing an especially ephemeral aspect of media production.

Insider Positions

A broader understanding of the position that media industry insiders occupy can help scholars use the insider material in backstage sitcoms to illuminate queer TV production. The word "insider" designates a set of people with access to information withheld from others. I hesitate to use the term in relation to queerness, because people tend to think that an insider position automatically signals privilege, and heteronormative (and homonormative) forces continually police and expel queerness – from public and private life as well as from representation. The perspective that insider material channels is more typically the province of social outsiders, whose relationship to privilege can be complicated.

Consumer capitalism, which demands the appearance of novelty alongside familiarity and sameness, makes specific demands on the producers of popular culture. Standardized modes of production, distribution, and exhibition ask creative people

to make concessions to turning a profit – which is the “bottom line” – demanding they navigate a maze of social relations oriented toward making money from art (or making money *rather than* art). Through self-reflexivity around topics related to these processes, insider material highlights the constraints and contradictions that media makers encounter in creative work, which stem from pressure to please the public – or at least to strike a chord with a certain audience segment.

In the commercial arts, the relationship between workers’ knowledge of the industry and their position within it can be out of step. Memoirs of Hollywood players attest to this. Diversely positioned participants in studio systems cultivate knowing viewpoints on industry relations in light of their everyday encounters with the business side of entertainment – be these direct encounters or ones that happen through decisions trickling down from people with more control. Whether owners, executive producers, high-profile actors, and in-demand writers or bit players, uncredited editors, prop artists, and personal assistants, media producers draw on experience with and on hearsay about contracts, casting calls, rewrites, and the like. Compared to people without access to Hollywood behind the scenes, these workers know more about why and how specific products get made. At the same time, different degrees of such knowledge mark divisions between producers with different roles, incomes, backgrounds, lifestyles, investments, interests, and alliances in the industry.

The insider perspective is not necessarily snide or condescending, although it can be. Being jaded by the industry is part of a complex pattern of emotional investment and disillusionment. There is a prevalent image of insiders as malicious executives; but self-deprecation and defeatism are also common outcomes of immersion in showbiz, particularly for those who occupy lower positions within industry hierarchies or who have a sense of artistic integrity in their work. Censorship, assimilation, and compromise are a fundamental part of life backstage. Experiencing these processes affects producers, especially those who belong to minorities and are unable to represent themselves on their own terms due to the cultural norms, interpersonal mores, and economic incentives driving the industry. The label “insider” may have a certain allure, but the entertainment world is full of (queer) people who see the high life without fully living it and may struggle for decades without ever really making it. Whatever their position within Hollywood ranks in terms of compensation and job security, or creative control and credit, workers maneuver for knowledge and clout in ways that relate to their subject position and status within the broader social hierarchies replicated (or refigured) by the industry. While there is considerable freedom in specific pockets of US media production with regard to diversity in gender and sexuality, the roles of influential LGBT players have historically been contingent upon these players’ obscuring central aspects of their lives or finding a way to be open where others could not.

Complex power dynamics related to these issues color the operations of the entire industry. Some producers who are not LGBT become knowledgeable about queer life and sympathetic to the everyday oppressions it entails, and they do so on the basis of behind-the-scenes contact with people in the industry. Participating in, or

being privy to, the production process can give people a skeptical view about the standard wheelings and dealings of show business. While many media makers remain immersed in the broader ideological beliefs of the culture, others see through them. Discrimination, favoritism, hypocrisy, and corruption consistently impact the making of major media texts. For those who are aware of the institutional dynamics surrounding decisions about different media properties, the personal is political. Whatever the producers' positions, their interpretations of their own everyday experiences at work shape their perspectives on hierarchies of power, cultural production, and the Hollywood racket.

Insider Material on TV

Most US television producers today live in Southern California and work in Los Angeles. The Bureau of Labor Statistics reports that, as of 2008, there were over 350,000 people in film and television production there. While New York – the TV industry's initial home – remains a broadcast center, industry wisdom holds that, for a chance at true success, hopeful workers must move to LA, an area whose palpable orientation toward Hollywood fosters hip and alternative social opportunities, cultivating specific industry subcultures marked by class, race, education, and language. In a context where studio big wigs tap into local talent and starving artists court a level of success that will forever transform their work, insider material emphasizes the ironies of the “tinsel town” experience for an assortment of media makers.

Satirical backstage programs regularly reflect insider perspectives by comparing the world depicted on television screens with the lives of the people who produce programming. Through cleverly orchestrated indirect meanings, these series express some of the ways in which life in the industry affects people's subject positions and sensibilities. Insider material tends to accentuate the ways in which media production cultures differ from the outside world. For example, when asked if one of his colleagues could find a child to act in a commercial he was directing, *The Dick Van Dyke Show*'s Robert Petrie, head writer of a fictional variety show, joked that he did not think they knew any; as a family man with a hybrid identity merging entertainment experience with a suburban-dad mentality, he was surrounded by people whose desires departed from cultural norms such as the convention of becoming parents. According to the insider view on backstage life – which typically occurs behind the scenes, but in this case appears on screen – people in the industry have different ways of living and crack jokes about topics that are taboo outside of either show business or queer culture.

While laying bare the reality of the industry's production cultures, first-hand knowledge of studio practices gives media producers a vantage point that differs from that of most people. Inasmuch as people interact with popular culture, it makes a significant difference if they encounter backstage details about certain figures and

affairs, particularly information that is not part of official marketing campaigns. Someone who takes celebrity reports at face value has a perspective on Hollywood products that diverges from that of someone with blackmail fodder on a closeted star, for example. While the average consumer must seek out information to deflate the romantic view the media industries cultivate about themselves, producers on the inside of the dream factory see these myths punctured as a part of their everyday lives. Being privy to behind-the-scenes affairs allows producers to form opinions about the actual – rather than the stated – circumstances around industry decisions. In view of the hierarchies and injustices of the system, acquiring insight into professional matters beyond the level of other people's insight can lend insiders a unique form of power.

Insider material indicative of this reality shines through in backstage TV programming. For example, comedy writers with a satirical bent generally have an intimate understanding of the censorship tendencies around queer representation and give vent to their frustrations through self-reflexivity in scripts. Backstage texts offer media producers an opportunity to create fictional representations of people in their own positions. Series set in the world of TV production open up a circle of knowing characters – which serve as proxies for actual insiders – for the home viewer and for the historian. In some cases, this connection is direct. Real-life comedy writer Selma Diamond inspired Rose Marie's Sally Rogers in *The Dick Van Dyke Show*. The talent agent Ari Emanuel influenced Bob Odenkirk's Stevie Grant in *The Larry Sanders Show*, as well as Jeremy Priven's Ari Gold in *Entourage* (HBO, 2004–2011). Even these characters, however, are an amalgam of different industry figures that their producers have encountered in the business. Series like these provide an important venue for examining industry tensions. Where the infrastructures of broadcasting guard the type of information that could provoke social change, backstage texts intervene. They channel undocumented histories of queer experience that resist the effects of dominant infrastructures and ideologies.

Insider Aesthetics

Backstage texts showcase undervalued aspects of TV history and should be analyzed as camp because they resonate at more than one level. Camp is a comic mode that interrupts conceptual divisions commonly depicted as essential and unproblematic. It does so by playing on incongruities related to sexuality, gender, race, ethnicity, age, era, and other markers of social distinction. Camp is a unique mode of production and a particular style of insider discourse. It is tied to the experience of minority groups with dominant culture. One of camp's principal markers is that its content exceeds what would be considered obvious by the average person. According to literary critic Susan Sontag (1999, p. 54), the camp mode approaches mass media products "as an aesthetic phenomenon [. . .] not in terms of beauty but in terms of the degree of artifice, or stylization." In treating popular culture as an art, camp emphasizes

unforeseen implications in everyday objects and texts and constantly creates new ideas with the cultural meanings that circulate through media. Through the most minor inflections, camp practices bring out profound nuances in different experiences and social dynamics. By experimenting with signification and other cultural phenomena, they create new possibilities. As Michael Bronski (1984, p. 43) writes, camp marks the talent to “see beyond what is clearly evident; to grasp a reality beneath or totally separate from what is taught [. . .] it contains the possibility of structuring and encouraging limitless imagination – to literally create a new reality.” Media producers draw on this talent, as do consumers.

Despite producers’ involvement in camp, scholars often study camp as a style of reception, explaining it as inherently about media consumption. Where the idea of camp texts is recognized in this school of thought, the double meanings of such texts are considered unintended meanings that viewers create as part of an original, unexpected interpretation. This approach involves an implicit assumption – and sometimes an explicit condition – that the sensibility consumers bring to bear on a product was completely foreign to the scene of its production. In this model, camp texts correspond to a history of cultural appropriation undertaken by oppressed groups, and not to anything camp about the texts themselves or about the people who made them. In fact, critics generally represent camp as a reading practice that goes against the original intentions of the producers behind the texts. Often things are understood to be more camp if their makers are sincere and the audience is not.

Within this paradigm, scholars have addressed camp as an underground queer practice that, particularly after the attention that Sontag’s “Notes on Camp” essay brought to it in the late 1960s, has been intermittently in the cultural spotlight, generally as a relatively sanitized version of a formerly queer practice. Along with studies of queer camp practices that take place far from the gaze of the mass media, scholarship has understood camp as a type of fan culture that, like other subcultures, is constantly being appropriated for profit by the culture industries, in cases ranging from ABC’s *Batman* series (1966–1968) to Madonna hits like “Vogue” (Sire, 1990) and beyond. Queer culture and camp are far from synonymous, but camp has been integral to many strands of queer production, from Wildean dandies, roaring 1920s drag performers, and interwar cabaret artists to the Harlem Renaissance, the postwar underground, and ACT UP (the Aids Coalition to Unleash Power). Camp has been a news item for decades, but it is still not widely understood. As Eve Kosofsky Sedgwick (1997, p. 27) points out, camp is often “seriously misrecognized” even by scholars working within gender and queer studies.

The literature on camp thus focuses on issues of hegemony, including the ways in which on the one hand marginalized groups put popular culture to their own use and, on the other, the culture industries help secure ideological dominance by incorporating creative energies from these same oppressed groups. Television, for example, whether in music videos, “quality” programming, or cartoons, is a prominent mechanism for integrating queer sensibilities into the dominant culture by making them consumable for the broader public. While this model of cultural appropriation is invaluable for understanding many historical incidents concerning camp, it does not

cover all of the ways in which camp interacts with the media industries. In spite of camp's underground status and of the misperceptions surrounding it, many aspects of camp thrived before it surfaced in the mainstream; and they continue to do so, in television as well as in film and the fine arts.

Insider material is about production, not appropriation, and camp's status as a queer mode of production is fundamental to understanding how TV's backstage series differ from other forms of camp. Writers, performers, and other workers draw on camp as they make programs, treating their own everyday lives as an object of art, to satirical ends, through displaced and specialized forms of address. Camp's foremost characteristics are an interest in the artistry of everyday objects, an investment in intricacy and in increasing embellishment, and a desire to expose contradictions and ironies in the way people think about culture. On the basis of this orientation toward overlooked elements of everyday life, camp continually draws attention to details about the way things are made and meanings circulate. As a result, while its connections to queer culture on the receiving end of the media industries are vital, camp is about media production – and in many ways fundamentally so.

The most compelling work on camp production stems from scholars' attempts to describe where queer culture comes from and how it is produced amid such hostility. Satirical queerness often appears in the guise of straight characters, and this helps producers avoid having their work (and themselves) identified as queer. The need to displace queerness feeds into camp's satirical work by calling for representations that are simultaneously undetectable to those who disagree with them and "in your face" from a queer perspective. Steven Cohan (2005, p. 17), for example, describes camp as the "outright satire" of "straights' blindness to a queerness standing with hands on hips right before their eyes." Even when it is seemingly unrecognizable as queer, camp reflects – as Bronski (1984, p. 43) explains – the various ways in which "queers try to preserve their own [. . .] livelihood in a homophobic setting." When producers make media in the camp mode, they activate a layer of meaning that others, who share their view, can appreciate. While television programming and the culture that surrounds it are certainly known to provide camp – whether in the form of movie reruns or sitcom characters like *Will and Grace*'s Jack McFarland and Karen Walker (NBC, 1998–2006), or like *Queer as Folk*'s Emmett Honeycutt (Showtime, 2000–2005) – backstage series have yet to be critically addressed as a primary source of camp. Various aspects of the industry have established and sustained camp as an everyday part of the culture of television comedy production – a part that is noticeably queer and intimately tied to the industry's production processes across the postwar era and today.

Safety in Numbers

Camp, insider material, and queer television representation are intimately intertwined, historically as well as conceptually. Like camp, comedy works through mul-

multiple layers of meaning, and satirical producers tend to play up the camp viewpoint that generates insider material because queer content is often comic and can serve as a punch line. Self-reflexive media texts like satirical backstage TV series call for critical distance on the production process and build a space of knowingness into programming content. This space sustains the density of signification required for queer meaning. As Chris Straayer (1996, p. 2) writes: "A queer viewpoint [. . .] raise[s] questions and propose[s] strategies that reveal subtexts and subversive readings in a more complex system than the patriarchal heterosexual system assumes." In the US TV context, camp gives vent to comedy producers' feelings about what their networks and sponsors consider permissible and what they will include or cut.

From the industry's inception, broadcasters have understood censorship of programming content to be an integral stage of the production process. As a 1951 article in the trade journal *Sponsor* put it, "the business man" working in TV had a responsibility to "reflect and echo public taste as commonly interpreted" (Boddy, 1990, p. 98). The US networks acted in the private interest of corporations and, in conjunction with government regulation, promoted the need for censorship. With McCarthyism and the purge of dissidents from entertainment, the industry carefully sought to prevent any evidence of a connection to the "political, artistic or literary avant garde" from appearing in programs, in part because it relied on unorthodox creative laborers. With ongoing deliberations about what was permissible and what would be aired or excised, insider material often appeared as a form of retaliation to network bias against it. In this context, comedians would regularly poke fun at executives and at their censorship practices through the programming they produced. To do so, they often created suggestive material around sexual non-conformity and gender variance.

While camp is by definition attuned to issues of production, as these relate to social differences such as gender and sexuality, the camp mode evident in satirical backstage television comedy is especially oriented toward the heteronormative constraints on creativity that a range of producers experience in the television medium. The industry is hyperaware of demographics, marketing, and Nielsen ratings, and producers are regularly coached to prevent anything that might alienate the show's desired audience from making it to the final product. This process can be contentious, as was demonstrated by the production histories of programs like *Rowan and Martin's Laugh-In* – a late 1960s variety show with slang and in-jokes that NBC's censors could barely keep up with – or *Ellen* – a 1990s sitcom that ABC (and Disney) monitored so closely when the lead character was about to "come out" that this point in the plot became more about publicity than about crafting a nuanced story. Camp responds to this kind of situation without implicating its producers, by generating incisive and specialized commentary around the industry's protocols and failed attempts at repression. On a special event program that promoted the new NBC shows of the 1958/9 TV season, for example, George Gobel momentarily spoke the language of NBC's "suits," presenting a pie chart that showed the decline in comedy variety – one of the main sources of insider material at that time. Suggesting that

the network favored money over morals while it promoted itself as a guardian of American values, Gobel called NBC executives “not really crooked, but a little kinky” (*The Steve Allen Show* of September 21, 1958). Referencing the industry’s corruption and hypocrisy just as the quiz show scandals broke, this metaphor of kinkiness as being better than crooked doubled as slang for niche erotic behaviors, many of which can be understood as queer. Gobel’s job at NBC may seem like stereotyping, since it associates sexual “deviancy” with violations of business ethics. However, with TV comedy producers implicated, to an even higher degree than their bosses, through associations of entertainment production and sexual non-normativity, this line emphasizes queerness at each end of the industry. At another level, it ironically gives voice to the ribald sensibility executives were attempting to strike from programming by firing comedians and by dropping variety shows. At postwar moments like this and through to the present, camp productions have been informed by an insider sense of the freedom of representation available in backstage situations. Participating in this tradition, they have recirculated queer history from an insider perspective.

In television comedy, the camp mode has contributed to representations that were potentially scandalous, but ultimately fleeting and generally unremarked upon. Adapting to the industry’s production processes, the producers of backstage shows typically situate minor characters and incidental guest stars as sources of queer history, simply because these are more expendable and less in the spotlight. Because not everyone who is queer participates in camp and not everyone who participates is queer, insider material emerges as if from a diffuse collective, as part of everyday life behind the scenes in a profession that relies on queer producers while willfully ignoring their centrality.

Writers and performers are major forces in the circulation of insider material. The collective authorship of scripts means that writers are not always themselves held responsible for the risqué material they may produce. Comedy series can have 10 or 20 writers on staff at any time, and they often employ more. While a writer constantly referencing queer things may not get very far or last very long, the potentially taboo content of television productions is typically assessed at the group level, through general negotiations with the writing staff as a whole. Producers tend to mediate conflicts with executives, allowing writers and performers a certain amount of leeway in what they can try to get away with before encountering pressure from censors or being forced to drop material that people higher up consider beyond the pale. Actors and television personalities engage with insider material across a similarly mediated playing field. While TV stars are under extreme pressure to maintain a particular image, they can always blame questionable material they perform on writers. Entertainers are under intense scrutiny, but they are also rewarded – and often – for “ad libbing” racy material. They may be experts at slipping even racier material under the radar of the industry’s authorities. While a series showcasing an insider sensibility can be up a creek if it does not have enough general appeal, a person with this sensibility has an advantage.

Throughout commercial television history censors have continually attempted to shut down material with overtly sexual connotations, a subset of which includes queer content. In relation to queer representation, the industry wins the war but wages a losing battle on a smaller scale. Television camp is thus a great example of how queer culture proliferates in the face of attempted repression (and it does so at the level of discourse as well as at that of individual agency). It also indicates the extent to which camp, like other forms of queer production, springs from a string of factors beyond individuals' self-identification as LGBT. Although the creative mindset behind camp is directly tied to queer experience – most commonly, the experience of eluding or defying social norms around gender and sexuality – it is never a direct function of sexual orientation. Paul Roen (1994, p. 9) notes, “an enormous amount of camp has been perpetrated by heterosexuals,” while “a dreary assortment of gay men [. . .] are unable to comprehend the very concept of camp.” Within an industrial production context for film, Cohan notes that camp is a complicated result of “the collaboration of queer and straight personnel” as they produce programming by following standardized network procedures for specific formats and genres (2005, p. 87). This collaboration process adds another queer element to camp by resisting the essentializing connections among gay men and camp that people commonly assert.

Queer TV Culture

The term “queer” is crucial for tracking the interconnections among insider material and camp in backstage TV over the years. Scholars often use “queer” to designate representations that call into question the apparent coherence of concepts like heterosexuality, homosexuality, masculinity, and femininity. As scholars in many disciplines point out, social inequalities take place through the construction of categories like female, male, straight, and gay, as they intersect with particular ethnicities, cultural locations, and material contexts. “Queer” describes textual and intertextual dynamics – in addition to social dynamics – that undermine the formation of dichotomies and hierarchies in the realms of sex, gender, sexuality, race, class, ability – and beyond. “Queer” can also signal an emerging or erratic space of cultural production, particularly of new or unregulated possibilities for gender and sexual relations.

“Queer,” in this use, is often assumed to be a recent derivation. It is commonly understood that activists first reclaimed “queer” in the 1990s; but some artists appear to have had a similar relationship with the word much earlier. When scholars encounter instances of “queer” people, or of behavior labeled “queer,” prior to the 1990s, they typically infer the exclusively derogatory meaning of a slur, or they translate it into a more benign sense of odd or eclectic, deemed to be unconnected to the proud usage of contemporary queers. Yet the term's use in the past can also be seen as a marker of pride in social difference, as well as an appropriately evasive strategy for

representing gender and sexual non-conformists who rejected the medicalized label of homosexuality. Dating back to the postwar period, self-identified coteries of queers united around shared artistic ideals, gender rebellion, and other points of social antagonism. Throughout the era of early television, various subcultures eluded hetero norms and refigured them for their own purposes. Historiographers (Howard, 1999) and literary scholars (Adams, 1999) have found that self-described queers used “queer” as “a self-conscious redeployment of the pejorative connotations that accompanied the term” at least as early as the 1950s (*ibid.*, pp. 554–555).

At the same time, modes of artistic production that are not self-consciously queer have regularly fostered queer culture. When considering insider material, television’s unique forms of representation are as important to address as its specific modes of production. Particular forms, especially comedic and episodic forms, can be understood as queer for a variety of complex political and aesthetic reasons. Many camp forms are queer because of a formal connection as well as because of a cultural relation. In response to secrecy, denial, and silence around queer culture, these representations employ inventive and anarchic logics; turn naturalizing discourses on their heads; and occupy positions in contradistinction to dominant norms. While producers often engage different facets of queerness through *double entendre*, intertextual references, physical performance, and fast-paced dialogue, their use of similar strategies to represent not so queer content has also, in many cases, circulated queer meanings and new possibilities. These strategies, in addition to being formally queer due to their divergence from conventions of verisimilitude and sincerity, are also recognizably queer in that producers have very often used them to convey queer content that industry watchdogs would otherwise censor. Queer forms tend to foster queer content and concurrently call it up by association.

Camp strategies can also be queer by virtue of the particular ways in which, as circulating texts, they produced queer possibilities in public culture. While the content of queer images is crucial to the ways they signify, insider material in a camp mode also proliferates queer forms. From Arnold the pig’s TV watching on *Green Acres*, which simultaneously takes a derisive swipe at audiences and construes the small screen as a magical medium, to the flicker of Chuck Lorre’s split-second vanity card rants (readable only on “pause”), which allow this writer–producer–director to vent about his experience in the industry, images that might not seem queer or have queer people identified with them regularly participate in queer culture. Queer culture is a realm of public interaction stemming from “queer” as a point of positive self-identification. Queer culture emerges from the social spaces, artistic productions, and popular touchstones negotiated by queer people. Its markers are blurry because of its generally queer-phobic surroundings and because of the crossover between it, show business, and other art cultures. While hostile to queers and queerness in its own ways, Hollywood has long welcomed queer labor and has thus been more likely than other fields to harbor queer culture.

Even as the media industries have promoted dominant norms, they have been crucial to the development of alternatives to traditional family living, both through

the production cultures they generate and at the level of representation. Hollywood's queer enclaves predate TV. As Abrams (2008, p. 7) shows in *Hollywood Bohemians: Transgressive Sexuality and the Selling of the Movieland Dream*, popular images produced in Southern California represent the place as a world of freedom and artistic expression. Throughout the first half of the twentieth century and beyond, such images associated opportunities for producers with the region's "sexual abandon," depicting a social landscape in which "homosexuals, adulterers, effeminate males, and butch females [. . .] embodied the pleasures of the forbidden and the taboo." According to him, this convention of using sexual nonconformity and queer gender to represent Hollywood demonstrated to viewers that "those who did not follow norms could lead successful lives" (ibid.). While myriad changes have taken place since the period addressed in Abrams's study, media publicity has continued to associate Hollywood with offbeat opportunities and queer labor with the media industries. Images of commercial artists often present simplified versions of lived deviations from dominant gender and sexual norms in ways that demonized or ridiculed these differences. Nevertheless, these representations generally establish connections between media production, the freedom to be queer, and the possibility of being rewarded for queer work. As Matthew Tinkcom (2002, p. 32) explains, the "chance given to queer men and women *to labor as queers*" is a fundamental component of the "liberatory possibilities" available in Hollywood.

One subplot of a 2008 episode of *30 Rock* titled "Subway Hero" demonstrates the strong links between backstage series' self-reflexivity about media production and their understanding of queerness as a part of entertainment. While exposing the mid-century media industries' rampant sexism and racism (à la AMC's *Mad Men*, 2007–), this narrative thread simultaneously represents the seemingly archaic culture of NBC during TV's "golden age" as a place of unforeseen sexual freedom. With rapid fire winks, the show suggests that, while some things have changed – Tina Fey's Liz Lemon is a big shot, not a "sandwich girl" – many other things too taboo to be broadcast remain the same behind the scenes. This subplot hinges on the performance of seasoned character actor Tim Conway's guest appearance as Bucky Bright, a forgotten television celebrity. Visiting the studios where the fictional *TGS* (a doppelganger of sorts for *Saturday Night Live*, NBC, 1975–) is produced, Bright reveals repressed aspects of the medium's past to network page Kenneth Parcell (Jack McBrayer). Kenneth, a straight-laced aficionado of broadcasting minutiae who claims to have studied TV theory at Kentucky Mountain Bible College, is thrilled to meet the former star, until Bright's comments about the earlier period disrupt Kenneth's naïve vision of their sacrosanct profession.

In one of the more striking comic moments, Kenneth – a character that, as *30 Rock*'s writers alternately suggest, is closeted to himself and straight (but really weird) – is shocked to hear Bright reminisce about how having sex with another man did not make you gay when he worked in TV – from the 1940s, when TV broadcasts first began, through to the early 1970s, an era still undisturbed by the emergence of cable channels and fanfare around overt LGBT characters. After Bright sees a picture

of himself among a boat crew resembling the cast of *McHale's Navy* – a satirical military sitcom from the 1960s on which Conway starred – he tells Kenneth about a time when “men were men” and he spent a lot of time with “the boys.” Back then, he says, “If you wanted to do something private with another man, it wasn’t gay. It was just two men celebrating each other’s strength.” As Kenneth recoils from the picture of old school television production that Bright paints, he realizes that his experience at the network is just as outrageous.

Bright’s comments identify a disavowed history from the postwar period within the infrastructure of network television, describing the queerness thought to be absent from US TV culture prior to the 1980s as quite obviously present. Bright’s revelations about the medium’s golden age depict it as a time during which practices related to everyday queer life went on undeterred, despite the fact that anything even vaguely sexual – much less homosexual – was purportedly censored. Conway’s appearance is one of many recognizable doppelgangers connected to real-life production contexts in *30 Rock*. The tour of NBC’s office and studios that the employees of its show-within-a-show give visitors, which mirrors an actual tour and facilitates namedropping from the network’s history, is another. In one instance, Kenneth directs a group to the place where, he says, comedian Gracie Allen “took Jack Paar’s virginity.”

Like the material written for Conway, this joke represents a queer take on gender and sexuality. It also connects the ostensibly fictional to actual history, by revealing queerness in the repertoires of TV comedians from the postwar period – a broadcast era assumed to be conservative and conformist, but which actually aired a lot of controversial material under the radar of industry watchdogs. The line is funny in part because, at the level of gender trouble, it rings true to the performers’ oeuvres. Kenneth’s evocation of Gracie Allen (one of the medium’s stars in the 1950s, who was routinely dismissed as scatterbrained and childlike but demonstrated an expert command of adult humor) and of Jack Paar (a major personality in TV in the 1960s, who was emotionally volatile and famously confronted the network about censorship while on air) suggests privileged insight into the semi-public lives and performance styles of comedy icons – lives and styles that conflict with the ways official TV history represents their onscreen personae and overall output. Bringing together two icons that a contemporary audience may not know, the joke associates stars who delivered queer content over the course of their careers with a televisual legacy of gender and sexual eccentricity.

Backstage images produced within a camp mode have continually celebrated and explored what Alexander Doty (2000, p. xiii) calls “moments of ‘multiple queerness’.” In order to pursue the line of questioning above, consider an example from *The George Burns and Gracie Allen Show* (1950–1958), a hybrid sitcom-variety vehicle for the radio legends that merged theatrical skits with direct address. On a 1950 episode of this program, Gracie informed her husband that “ninety per cent of all fickle husbands are men!” and George, turning to the audience, said: “The remaining ten per cent are handled by our agent.” This joke suggests that there are a lot of queers working in

Hollywood, and it does so by raising the possibility that not all husbands are men and by referencing a statistic that is resonant both with the Kinsey reports on the prevalence of homosexuality and with the standard cut agents receive from their clients' paychecks. Husbands who are not men can refer to husbands who are women (like butch dykes or trans women), and to husbands who are not women but might be likened to them (fags and trans men). By simultaneously alluding to these possibilities while also evoking something outside of them (whether non-binary genders or a more elusive sense of queerness), the episode creates a moment when, as Doty (1993, p. xiii) puts it, "a number of distinct, sometimes contradictory, queer aspects or approaches suggest themselves in the face of a mass culture event." In Doty's words, this "multiple queerness" is part of why it can be "difficult [. . .] to attribute the queerness of mass culture to just one source or another" (ibid.). In light of the collaborative process of comedy production and of the way in which insider material circulates within show business, such instances of queer representation can be seen to arise from the industry itself as much as from an individual writer or performer.

Camp accrues even around Hollywood types that seem completely straight. For example, when hyper-heterosexual shock jock Howard Stern makes a guest appearance on *The Larry Sanders Show* – a series concerning the eponymous late-night talk show in which writer-producer and star Garry Shandling regularly interviewed celebrities playing themselves – and it turns out that Sid (Sid Newman), the man in charge of the cue cards, is a huge fan, Stern tells Sid to "take his top off," comically likening Sid to the babe-types that Stern regularly ogles during his radio program, despite Sid's gender. This joke does not mean that either figure is gay; as it collapses Stern's male and female fans and points to the homoeroticism of media consumption, it should be understood as queer – as should the appearance, in the series, of stars like Brett Butler, Ellen DeGeneres, and David Duchovny, all of whom played against their perceived sexualities. Issues of gender presentation and perception work similarly. In the *30 Rock* episode addressed earlier, for example, Conway's Bucky Bright character reports that, while wandering the halls of the NBC building overnight, he encountered a "giant lesbian," and he asks Kenneth: "Who is Conan O'Brian, and why is she so sad?" While this line might seem homophobic in its appeal to the narrow-minded perception of lesbians as "imitation men," it accentuates the queerness of industry types – pointing to Conan himself as an "imitation man" – and thus it trades in the discourse of stereotypes while cultivating representational inversions and ironies for comic effect. As Ann Pellegrini (2007, p. 178) writes, "by refusing to refuse [. . .] stereotype[s]," camp "convert[s] the sting of stereotype into the sharp wit of social commentary." This camp conversion links queer gender, queer sexuality, and queer forms of representation.

Distinct from gender identity, yet highly intertwined with gender representation, queer sexuality refers to eroticisms that resist description as exclusively straight or gay. In some cases, an image registers differently from both hetero- and homosexuality. In other cases, it is especially distinct from one but not in a way that fits with the other. Consider, for example, a brief exchange during the *Burns and Allen* episode

discussed above, in which Gracie thinks that her neighbor Harry is sleeping with his new secretary behind his wife Blanche's back. Gracie's suspicions are initially aroused because she assumes the secretary is a woman; but when Harry arrives with Blanche and introduces a man as his new hire, Gracie takes the same attitude despite the change of gender, telling Harry: "You're silly to chase after him. She's much prettier." This joke suggests that there is no significant difference between homo- and heterosexuality, even though differences between men and women are obvious. This sentiment runs counter to the dominant discourses on gender and sexuality in place during the time of the episode's production.

Not all topics are fair game in showbiz at all times. However, as countless Hollywood memoirs (and the 2005 film *The Aristocrats*) show, a significant amount of space has been available backstage for speaking about subjects considered unmentionable elsewhere. Looking at the way references circulate about homoeroticism, sex, women's sexual conquests, gender variance, and bi/pansexuality sheds light on the possibilities for queer production in media contexts assumed to be homogeneous. Insider material highlights the fact that the world of big-time media production and the world outside of it can be vastly different, and that this difference can affect the industries' final products. Camp representations mobilize queer content through insider material, doing their defamiliarizing work not through statements with a traditional veracity but rather through hyperbole, obliqueness, and euphemism, or even through comments that seem patently false. The queer investments of camp include, as Sedgwick (1997, p. 28) explains, "the prodigal production of alternate historiographies," an "irrepressible fascination with ventriloquistic experimentation," and "disorienting juxtapositions of present with past."

Without striving to translate insider material at a literal level, we can use it to record a complex legacy of small screen comedy that has otherwise been absent from television studies' version of TV history. To return to a *30 Rock* example cited above, it is possible, but unlikely, that Gracie Allen actually had sex with Jack Paar in the hallway at NBC; so why is she represented as having "screwed" a fellow comedian? Jokes about television comedians in quasi-fictional series point to an important interchange between onscreen and behind-the-scenes television production across time. Representations of what it is like to make television connect with reality in direct and indirect ways, which illuminate actual TV productions and texts. While the connection between the backstage worlds on television and their real social contexts can be metaphorical, specific details often signal that some aspects of the fictional environment emanate from actual occurrences. Queer content that appears in this representational space reveals an unacknowledged aspect of industry life.

Conclusion

The material that backstage programs use to satirize the industry broadcasts an insider version of TV history that treats the creation of queer media as an established

fact rather than as an unfounded allegation or an impossibility. For anti-homophobic and anti-transphobic media scholars, the unique truth value of insider material provides leverage for reckoning with heteronormative interpretative contexts that are constantly second-guessing the existence of queer media. Taking a wide view of censorship, artistic compromise, and small-scale rebellions, we can use backstage series' representations of production contexts to capture the textual effects of collaborative work in industrial media in the present and in the past. Across decades, the networks of TV comedy producers who create backstage representations have demonstrated great facility with the instabilities of the sex/gender/sexuality system. Given the tight constraints on programming, comedy producers' most interesting work – from an artistic perspective and from a political standpoint – often plays out in ephemeral aspects of life as a commercial artist, both on and off the clock.

Not all backstage shows were camp, and not all camp took place in backstage settings; but, when brought together, the various components of “queer” collided, providing fertile ground for unpredictably queer dynamics. Camp moments of television programming, no matter how brief, created dense nodes of queerness, which expand the space of formation for possible queer subject positions. For viewers, recognizing camp requires an investment in the details of multiple webs of interconnected insider perspectives. Camp knowledge of different social contexts, production factors, and textual forms produces insider material; a predisposition to mobilize this type of insight aids in its reception. It may be the case that queer producers are the entire insider audience at the receiving end of camp. However, it might also be the case that televised camp engenders queer producers. As critic Bruce Hainley (1993, p. 2) has observed, during the 1950s, TV was “almost as instructive” in teaching gay camp traditions as first-person initiation into queer subcultures.

There has been a consistency about the insider position across historical change, because, despite increased rights (typically, for those who are already relatively privileged), the broader heteronormative context and the pressures it creates for queer artists persist. Today's popular culture would seem to be vastly different from the media climate that existed when television programming debuted, yet insider material figures just as prominently in contemporary TV, not least because there is a continued need for queer perspectives that conflict with dominant LGBT norms as well as with hetero norms. An understanding of insider material that foregrounds its satirical powers is crucial to the study of queer camp in a post-network culture in which blindness to a more radical queerness occurs amid a hyperawareness of homosexuality and of an increasing range of gender and sexual minorities.

The archive of insider material in backstage comedy calls for paradigms of media analysis that allow for the possibility of queer representation no matter how heteronormative (or homonormative) the text or production context may appear (or how many LGBT characters or producers it may involve). Traditional frameworks for historicizing media production might dismiss fictional programming as a source of evidence in the study of actual studio cultures. However, historians can benefit greatly from this material. While clueing us into important forgotten aspects of media production, the appearance of Hollywood production contexts on screen can

help scholars develop analytic models sophisticated enough to unpack these representations. Camp complexity lends itself to a historical perspective on popular culture that recognizes queer production as an integral aspect of television comedy since the beginning of broadcast culture. It behooves scholars to interpret the insider material that producers reveal during comic moments within this sphere of recognition. From the beginnings of satirical TV comedy through to *30 Rock*, the camp productions of Hollywood workers have been informed by, and have recirculated, the queerness of showbiz history and the profound freedom in backstage comedy representation, available where it is least expected.

Hollywood Elsewhere

The Runaway Locations Industry and Transnational Production Cultures

Serra Tinic

ABSTRACT

In an era of rapid media globalization, transnational production practices have been transformed to the extent that Hollywood, both as a metaphorical state of mind and as a literal mode of cultural production. This chapter examines the cultural and economic debates surrounding the runaway productions through a case study of Vancouver, British Columbia – a city that has been dubbed “Hollywood North” and is now considered the model upon which other international cities attempt to build their own service industries to attract and accommodate US television and film productions. Drawing upon my previous fieldwork within the Vancouver television production community (Tinic, 2005), I argue for a reconsideration of the ways in which we study media production to better address the local, regional, and global reconfigurations of space and culture that accompany the economic dimensions of the international locations industries.

In one of the first ethnographic studies of the US motion picture industry, Hortense Powdermaker (1950, p. 23) stated: “Hollywood itself is not an exact geographical area, although there is such a postal district. It has commonly been described as a state of mind, and it exists wherever people connected with the movies live and work.” Sixty years later, the rapid pace of media globalization has transformed

transnational production practices to the extent that Hollywood, both as a metaphorical “state of mind” and as a literal mode of cultural production, is now located in Prague, in Vancouver, in Australia’s Gold Coast, and in other international destinations. Over the last thirty years an increasing number of US television and film producers have moved their projects outside of the United States, in search of artistic realism in locations shooting and also in pursuit of the economic benefits offered by favorable currency exchange rates and labor environments. Consequently cities around the world are investing in the requisite production infrastructure and creative personnel to compete for a piece of what has come to be termed the US “runaway locations industry.” The rise of these new Hollywood service centers brings questions of the spatial politics of global inter-city competition to the forefront of media production scholarship. Therefore an exploration of the cultural geography of the new creative networks developed between Hollywood and these “locations” cities is imperative to understanding contemporary changes in the media industries and in the texts they produce across national contexts.

This chapter examines the cultural and economic debates surrounding runaway productions through the case study of Vancouver, British Columbia, Canada – a city that has been dubbed “Hollywood North” and is now considered the model upon which other international cities attempt to build their own service industries, in order to attract and accommodate US television and film productions. The story of Vancouver’s development as Hollywood North dates back to the 1970s, when the provincial government established the BC Film Commission with a mandate to attract and facilitate US film and television production as a means of diversifying a resource-based economy that was suffering the exigencies of global commodities markets. By capitalizing on the geographical diversity of the province’s scenery, on the lower value of the Canadian dollar, and on physical proximity to Los Angeles, the commission contributed to the development of a service locations industry that would eventually establish Vancouver as the third largest production site for US television series and movies, after Los Angeles and New York.

Vancouver’s relationship with Los Angeles-based producers transformed the region’s television and film production community in ways that have not been adequately discussed in much of the academic scholarship about runaway productions. Not only did the entrenchment of Hollywood North allow for the development of new creative partnerships and intercontinental professional networking, it also led to a global profile for the city that would establish it as a centre for international co-production projects. However, rather than exploring the transnational reconfigurations of space and place evidenced by Vancouver’s rise as a production centre, much of the academic debate remains mired in nationally focused macrolevel analyses of the political and economic dimensions of locations production.

In the United States, Vancouver’s success in attracting runaway productions led to vociferous complaints and to intensive lobbying, within the Los Angeles production community and within labor unions in particular, to “bring the industry back home” (Haysom, 1996). Such sentiments came to be echoed in scholarly research

that implicitly connects the runaway locations industry with other forms of global economic outsourcing – such as the flight of the automobile and information technology industries (Miller, Govil, McMurria, Maxwell, & Wang, 2005). In Canada, analyses of Vancouver as Hollywood North resonate with the earlier work of Dallas Smythe (1981) and with his compelling insights into the peripheral status of Canadian television within the North American political economy of broadcasting. Without overt reference to the concept of cultural imperialism, the implication of recent analyses is such that the presence of US productions may operate as a form of production imperialism wherein the city and the province become a branch plant for LA-based studios and executives (Christopherson, 2005; Gasher, 2002). This is not to say that issues of labor strife and continental inequity are insignificant, but rather that such matters only provide us with a partial understanding of the multifarious implications of new transnational production practices. As O'Regan and Goldsmith (2003) assert in their study of the Australian context, such nationally focused analyses, and the qualification “runaway” for locations industry itself, privilege the conceptualization of Los Angeles as somehow the only “natural” home to Western television and film production. In their preference for the phrase “international studio complex,” the authors underline the importance of studying contemporary production cultures from a transnational vantage point.

My argument here offers a parallel to that of O'Regan and Goldsmith and to their call for the exploration of an “international production ecology.” Drawing upon excerpts from my previous research within the Vancouver television production community (Tinic, 2005),¹ I present new questions and frameworks for case studies of global production locations centers. I assert that, as industries of cultural production become increasingly mobile, we need to be better attuned to the ways in which producers work across borders and contribute to the emergence of new global media networks and of media spaces in general. In brief, I argue for a reconsideration of the ways in which we study media production, so as to address better the local, regional, and global reconfigurations of space and culture that accompany the economic dimensions of the international locations industries. Such sites have often been neglected or subsumed under dominant considerations of national systems of production. In the case of Vancouver, the evolution into Hollywood North may in fact facilitate the development of the city into a “media capital” as depicted by Curtin (2003, pp. 204–205):

[. . .] [cities] that have become centers for finance, production, and distribution of television programs. Centers of media activity that have specific logics of their own that do not necessarily correspond to the geography, interests, or policies of particular nation states. [. . .] They are switching points rather than containers.

The chapter begins by contextualizing “Hollywood North” within contemporary debates about the cultural geography of economic and cultural globalization processes. I then offer an overview of the specific governmental strategies that led to the development of the locations industry in Vancouver and of the concomitant aca-

demic critiques of runaway productions from both sides of the border. The following section extends Curtin's conceptualization of media capitals through a brief case study of the continental success of Vancouver showrunner Chris Haddock. Haddock's success in producing dramas for both Canadian (Canadian Broadcasting Corporation (CBC)'s *Da Vinci's Inquest*, 1998–2005) and US (Columbia Broadcasting System (CBS)' *The Handler*, 2003–2004) television networks illustrates the new forms of cross-border creative networks that develop in transnational production contexts – a cultural dynamic that is often overlooked in macrolevel academic analyses of global media settings. The chapter concludes with the proposition that comparative analyses of the cultural, economic, and geographical distinctions among different runaway locations sites (or international studio complexes) can give us a better understanding of both the emergence of new global media capitals and the contemporary challenges and opportunities facing Hollywood itself.

Media Geographies: The Politics of Space and Place

In the 1990s media studies research began to engage in a productive dialogue with larger interdisciplinary debates about the contemporary dynamics of cultural and economic globalization. The works of cultural geographer David Harvey (1990) and of anthropologist Arjun Appadurai (1996), in particular, brought questions of mobility and spatiality to the forefront of global media analyses. In an era of scholarship that increasingly questioned the “nation-state” as a stable category of cultural identification, these authors contributed to a growing lexicon, which media studies drew upon, in an attempt to grapple with the contradictions and continuities that marked an acknowledgment that *international* no longer seemed an adequate modifier for the changing terrain of global communications practices and reception. Appadurai's depiction of “flows” and “scapes” of people, symbolic representations, and capital (to name but a few) and Harvey's emphasis on the transformative dimensions of global spatial politics in relation to the community formations of local places, underlined the increasing permeability of territorial borders and the multidirectionality of cultural exchange and impact. Although never explicitly articulated within these works, it seemed evident that the role of the media as both transnational corporations and cultural intermediaries should be brought to the forefront of questions of globalizing spaces at all levels, whether economic, interpretative, and/or representational.

Indeed, the media are inextricably linked to the cultural geography of globalization. The images they produce of spaces and places contribute to the global flows of people (whether émigrés or tourists) and discursive modalities. Moreover, the media industries, too, are increasingly mobile, as changes in production and distribution practices become transnational in scope. The evolution of the transnational film and television locations industry is but one example of the ways in which the media are implicated in questions of spatial competition and in the representation of places.

In a manner similar to that of other global corporations seeking economically advantageous conditions for the manufacture and distribution of their goods, Hollywood production companies are increasingly *dis-located* from their national centers in New York and Los Angeles as they move their projects on the road, in search of cheaper labor and aesthetic realism. The establishment of Vancouver, British Columbia as “Hollywood North” is one of the more vivid examples of the new forms of city–region competition that marks Harvey’s depiction of the struggle to control the terrain of space according to the interests of global capital. Consequently, in thinking about the relationship between the media and local, regional, and national communities, we need to reconceptualize *identity*, *space*, and *production* within a larger global cultural and political economic context (Mahon, 1993).

Most scholars tend to discuss globalization as a relatively recent phenomenon and focus their attention on the changes in the global economy that witnessed the passing of the Fordist model of production to one of flexible accumulation, from the 1970s into the present day.² Advances in satellite, computer, and other electronic communications technologies – and the consequent *placelessness* of international capital – marked the 1980s as a decade of rapid movement into a global political and economic environment marked by interdependence between its parts (Robertson, 1990). In this era of “disorganized capitalism” (Lash & Urry, 1987), questions of group identity become more problematic as people, cultural forms, and production practices are no longer territorially fixed. In communications terms, the media are implicated in contributing to the simultaneous development of supranational and subnational group affiliations that have led some Western nations to confront conflicting conceptualizations of cultural identity – local, regional, and national – for the first time.

To review the growing body of literature on the cultural ramifications of globalization from a Canadian vantage point is to experience an unsettling sense of *déjà vu*. As political economists will argue, the Canadian economy prior to the 1970s is best described as one of “permeable Fordism,” in that its particular characteristic “since 1945 [was to be] permeated by international – or more exactly, continental – effects. Its Fordism was designed domestically, but always with an eye to the continental economy” (Jane Jenson, quoted in Angus, 1997, p. 23). Those years immediately following the end of World War II were a contradictory time in Canada’s national trajectory. It was, in Harold Innis’ terms (quoted in Laba, 1988, pp. 86–87), its brief moment of nationhood between British colonialism and US economic imperialism. By the 1960s Canadian industry was beginning to be seen as a branch plant of US corporations, and internal fault lines deepened as a result of increasing complaints of colonialism from within – Ottawa against the provinces and Québec against the country. It is within this context that Vancouver’s development into Hollywood North has been critiqued as the logical outcome of a continental economic relationship in which US capital interests subsumed Canadian labor forces.

However, as theorists debate the dissolution of the nation as final arbiter of a sense of community under the current processes of globalization, they address an issue that echoes the Canadian experience since the nation's establishment – namely the fact that local, regional, national, and continental/international identities have always coexisted and competed within the political and geographic construct of the nation-state, and that such community identifications need not be mutually exclusive. It is precisely this dialectical relationship between global and local cultural practices that is most evident in the example of the Vancouver television industry and in the larger Canadian national identity debate. Among the producers I spoke with, only a few did not express a desire to operate within three cultural fields at once: the local, the national, and the international. If given the opportunity, they intended to take the particular experiences of their community (which cannot help but be inflected by global themes, given the large, diverse, and active ethnic communities within Vancouver), set the stories *within* the larger national context, and circulate them throughout the international marketplace. The realities of international television production and the quest for distribution and markets, to some extent, demand a fusion between the particular and the universal.

The role of cultural producers has only recently gained attention in media globalization studies, which tend to emphasize the rapid flow of media content in abstract terms, but rarely examine the specific negotiations behind the images that end up on television and on the movie screens around the world. However, these groups of transnational professionals can be seen as “third cultures,” which are important conduits of global cultural flows; and, while they operate in cosmopolitan circumstances, they are just as likely to be “locals at heart” (Featherstone, 1990, p. 9). It is, in fact, this cosmopolitan–local persona that I found reflected in my conversations with Vancouver television producers. Whether selling to the national networks or to international distributors, the independent producers underlined that stories that were overly *particular* to a place were difficult to pitch. In this respect, more homogeneous or universal programs are perceived to be more successful in market terms. However, a caveat was offered by all the producers, in that their choice of stories and the mode in which they told them could not but be informed by their own cultural and social experiences – the phrase most often used was that inescapably vague *Canadian sensibility*.

What was most interesting about the definition that each one provided when pressed as to the nature of this sensibility was the repeated reference to the experience of marginality, both within the nation and internationally – the idea that control and decisions were always elsewhere. In this respect, regional location was a strong source of identification for these people; but it was not separable from each location being a part of a larger collection of regions that were muddling through together, always in the process of trying to define themselves as a group. As these individuals underlined, the idea of the Canadian *nation* was still an important reference point, even when they operated in a global context. But within that context they retained

the sense of regional alienation and of lack of participation in the larger definition of the national community.

Decades ago, when discussing a definable *Canadian* identity, the famed literary critic Herman Northrop Frye commented that “contemporary Canadian culture, being a culture, is not a national development but a series of regional ones” (quoted in Mandel & Taras, 1987, p. 211). In fact, unlike broadcasting studies, Canadian literary and anthropological analyses have long emphasized the importance of locality or region as a creative force in the articulation of cultural expression. In this respect, the tensions between the forces of regional fragmentation, national centralization, and the US political and cultural presence have been fundamental to the frameworks of literary and ethnographic analyses.

The global flow of capital, as well as the global reach of popular culture via international media, has redefined the notion of local identity. The British architect Kenneth Frampton’s call for a “critical regionalism” is an especially useful framework for the study of Canadian culture and communication. According to Frampton, “local cultures can only be constituted now as locally inflected manifestations of global culture” (quoted in Robins, 1989, p. 161). Therefore, instead of looking for authenticity in local culture, critical regionalism seeks to examine how local identity is constructed through *pastiche* and *bricolage* from whatever cultural materials are available or *at hand* (de Certeau, 1984).

David Morley (1992, p. 282) refers to this simultaneous dynamic of “globalization and localization” as a “politics of space and place” wherein “places [. . .] are perhaps best seen not as ‘bounded areas’ but as ‘spaces of interaction’ in which local identities are constructed out of resources (both material and symbolic) which may well not be at all local in their origin.” The differentiation of *place* and *space* takes on new dimensions in the postmodern dilemma of cultural fragmentation. As Harvey (1990) explains, *place* (local culture) becomes crucial to marginalized groups, both intra- and internationally, as such groups have a better command over cultural definition at this site than they have over *space*, which is the terrain of national institutions and global capital. Thus, to the extent that fragmentation may lead to an intensified search for collective identity or may “secure moorings in a shifting world,” it should be explored within the context of place (*ibid.*, pp. 301–304).

In this respect, Vancouver provides a strategic location from which to examine the relationships between regional, national, and global cultural productions. Before the 1980s, Vancouver was the largest production center for English Canadian television programs outside of Toronto. However, with the increasing centralization of CBC programming at the network level in Toronto and with decreased access to federal broadcast production funds, regional television producers in British Columbia have felt they were denied the opportunity to tell English Canadian stories for almost twenty years. As a result, the Vancouver production community has taken advantage of the Hollywood presence and pursued co-venture agreements with US producers and co-production projects with other international partners to make programs for global audiences, of which Canadians constitute a small minority. The globalization

of the Vancouver television industry can be seen, from one perspective, as the logical outcome of the weaknesses of federal broadcasting policies and institutions that have sought to use nationalism, as defined by central Canada, as a “conscious strategy of pasting over the cracks” of regional discontent (Melville Watkins, quoted in Laba, 1988, p. 82).

National public service broadcasting began in Canada in 1932, with the establishment of the Canadian Radio Broadcasting Corporation (CRBC, which became the CBC in 1936) at the recommendation of the Aird Commission Report – the first in a long line of Royal Task Forces on broadcasting policy. The Aird Report was the first government mandate to institute the concept of *national unity* as a counterforce to US culture in Canadian communications policy. As Wayne Skene (1993) underlines, the Aird commission and subsequent task forces defined national unity as *inter-regional communication*. Within this model, programming was to originate in the provinces and the central network was to serve a function of dissemination rather than one of production. The committee was sensitive to the fact that a centralized programming system might alienate rather than unite the regionally distinct provinces into a nation. Therefore the foundation of a Canadian broadcasting policy was designed to encourage local producers to share among themselves their communities’ cultural narratives and to avoid a single, centralized definition of *Canadian* culture. However, the economic and technological challenges of developing the sizeable Canadian broadcast distribution system eventually led to the exact form of centralization that the Aird Commission had sought to avoid. By 1968, the year of a new Broadcasting Act, the phrase *national unity* had been changed to *national identity*, and television programming (as defined by headquarters in Toronto and Montreal) was seen as the means to create *a* Canadian identity and at the same time to defend oneself against US cultural domination (Raboy, 1990).

The centralization of decision-making for English Canadian television drama eventually culminated in a political struggle between the regional and national production centers over definitions of programming of sufficient quality to merit inclusion at the national network level. The situation became more acute for regional producers, as the federal government began to divest from national public broadcasting during the economic downturn of the 1980s. Regional programming carried the burden of the federal budget cuts, and by 1989 75% of the CBC program budget was allocated to national programming, while the remaining 25% (which was directed to regional production) was targeted primarily to sustaining local news programming (Hoskins & McFadyen, 1992). What little remained of regional drama production was lost in 1990, when the CBC was forced to address a corporate shortfall of \$108 million and did so by closing or downsizing several regional stations and by canceling hundreds of hours of programming. In the end, regional production suffered a loss of \$46 million, while only \$12 million were cut from the national network.

Consequently, when I first began fieldwork research in the late 1990s, there was not a single television drama in production at the CBC’s Vancouver production center.

However, the growing success of the provincial government's effort to establish the city as a primary site for US runaway television and film production provided new opportunities for domestic television producers to explore continental and international creative and financial partnerships that would, to some extent, mitigate their increased marginalization within the national broadcasting sphere.

Constructing Vancouver as *Hollywood North*

In the 1980s the Ministry of Small Business, Tourism and Culture in British Columbia developed the "Super, Natural British Columbia" campaign, which promoted travel to the province by extolling the beauty and variety of British Columbia's natural landscape in a series of advertisements directed both at US and at out-of-province Canadian markets. While "Super, Natural BC" remains the province's official tourism motto to this day, by the mid-1990s the formula became more closely associated with the fact that Vancouver was the production home of eight of the top US *supernatural* television series – including *The X-Files* (1993–2002), *Highlander* (1992–1998), *The Outer Limits* (1995–2002), *Sliders* (1995–1999), *Strange Luck* (1995–1996), *Millennium* (1996–1999), *Stargate SG-1* (1997–2007), and *The Sentinel* (1996–1999). The connection here is not meant to appear facetious. The rationale for producing these series in Vancouver is, in fact, largely the diversity of locations available in a coastal province that also contains a glacier mountain range and a dry, rugged interior region. The Lower Mainland's gray, rainy, and foggy winters also provide the natural light and settings that writer-producers and directors of photography (DPs) relish in their efforts to establish the necessary atmosphere for such programs. And it is no coincidence that the BC Film Commission, the organization largely responsible for recruiting runaway US television and film production, was initially established within the Ministry of Small Business, Tourism and Culture.

The connection to small business is, however, misleading. In British Columbia, film and television production and tourism are multi-million dollar industries that are integral components of the province's larger economic globalization strategy and goal to establish Vancouver as a world-class or global city. The financial success generated by runaway productions³ became vividly apparent during the watershed period of the 1990s. In 1997 the television and motion picture industry spent directly an estimated \$700 million dollars in Vancouver – an increase of \$100 million from the previous year. During that year, the BC Film Commission provided service to \$2.7 billion worth of productions (one third of the potential market) and confirmed Vancouver's status as the third largest production center for US movies and television series (BC Film Commission, 1997). In fact, of the approximately 200 television programs and movies shot in the province between 1996 and 1997, only an estimated 20% were domestic Canadian productions (Rice-Barker, 1997, p. 3). By 2000, the spending figure reached by the film and television industry had surpassed the \$1.18 billion mark.

This integration of the Vancouver locations industry into the larger Hollywood production structure has led critics to argue that foreign production has not only displaced domestic production in British Columbia but has also erased any sense of place, by commodifying this production or selling producers “an industrial setting (physical sites and services) rather than a cultural and historical site (a source of stories and characters)” (Gasher, 1995, p. 233). This indictment of US and other international productions in British Columbia is partially accurate. Foreign producers do not choose to bring their projects to Vancouver to tell Canadian stories or to portray Canadian settings. In fact, much of their pre-production work consists in finding sites that can stand in for other places, usually some place in the United States, and then in *dressing* them accordingly (which means removing any physical objects that could identify a location as Canadian in any way). The title of the BC Film Commission’s centerpiece promotional brochure, *The British Columbia Shooting Gallery: We Can Give It to You for a Song*, is indeed the best illustration of the argument that the locations industry commodifies Vancouver as geographical space to be sold to international television and film producers.

The Shooting Gallery is a 30-page glossy magazine that underscores the reasons why foreign producers have flocked to Vancouver over the past decade: the diversity of British Columbia’s geography, the inexpensive Canadian dollar (which fluctuated between 79 and 89 US cents throughout the 1990s and declined below 65 cents in 2002), well-trained film crews, and, importantly, the proximity to Los Angeles, the center of the US industry. The discourse of commerce provides the subtext of the publication and uses a play on words and song titles to frame snapshots of Vancouver communities frozen into stage-set vignettes with generic locations identifications: “The Big City,” “Urban Ethnic,” “Deep Woods,” “Industrial,” “Residential,” “The Mountains,” “The Period Look,” “The Railroads,” “The Countryside,” “The Farm,” “The Wild West,” “Small Towns,” “High Tech,” “Coastlines,” “Ranch Country,” and “Wilderness.” Beginning with the subtitle (*We Can Give It to You for a Song*), the brochure tells foreign producers that “This land is your land” and that, for a fraction of the costs elsewhere, Vancouver can be made to look like anywhere in the world; and it closes with the invitation to “Come and get it. . .”

However, the goal of attracting commerce – rather than the goal of national cultural development – was the central mandate of the BC Film Commission. The commission was created in 1978 by a provincial government that sought to diversify its resource-based economy by creating an industry that would not be subject to the exigencies of commodities markets. To this extent, the BC government’s economic strategy exemplifies Jane Jenson’s (1993) depiction of the patterns of post-Fordism in Canada during the mid-1970s and 1980s. At the time, the provinces found themselves increasingly in conflict and competition, in their efforts to restructure, politically and economically, in ways that “often implied abandoning efforts to protect the borders of the domestic economy” and favored “accommodating new regimes of accumulation” (ibid., p. 159). An important aspect of this process were the appeals made by provincial governments, using the neoliberal discourse of globalization,⁴ to

encourage “unions to participate in new kinds of tripartite bodies to design programs for restructuring industry and re-locating Canadian production in the new global economy” (ibid., p. 158). The BC Film Commission’s mandate exemplifies this strategy. The first step to developing the Vancouver locations and service industry was to negotiate a cooperative agreement with the BC film and television unions and thereby to establish a conducive economic environment for US producers. The next step was to send a team to Los Angeles and convince the studios and producers that Vancouver would be the ideal city for their production needs. One member of the commission summarized the province’s initial strategy:

LA has always been based around the top five or six major studios. Each of those studios has a major executive in charge of production for features, for television, etcetera, so you go and you sit in their offices with pictures, a portfolio book, with the union hand in hand – government and the union walking into the office and saying whatever it takes to get them up here and they would come. Sometimes a feature is going to come here anyway, because it’s locations driven. For instance, when [director] Fred Schepisi’s going to do *Iceman*, where are you going to get glaciers that are within 20 or 30 minutes’ flying time from downtown? Vancouver has that option – anything that’s wilderness-based, which is exciting for viewers – you can stay at the Sutton Place [a luxury, downtown hotel], go to the Seymour Demonstration Forest and look like you’re actually lost in the woods – work for 12 hours and drive back to the Sutton Place. It’s great and they like it. (Interview with author, August 13, 1997)

It is precisely these amenities, and the Seymour Demonstration Forest in particular, that made Vancouver home to *The X-Files* for the show’s first five seasons. The series’ creator, Chris Carter, needed a forest for an unidentified flying object (UFO) landing scene in the first episode and, as forests are somewhat scarce in Los Angeles, he found what he needed in Vancouver. Carter became one of the city’s biggest boosters, with his declaration that he had found the “biggest backlot in North America” (quoted in Leiren-Young, 1995a, p. S12).

Vancouver’s capacity to serve as the “biggest backlot in North America” was actually noticed long before *The X-Files* and the creation of the BC Film Commission. In the 1930s, when Canada was still a British dominion, Hollywood producers took advantage of the fact that shooting movies on location in British Columbia would allow them access to the highly protected film market in the United Kingdom. These “quota quickies,” as they were called, constituted the first stage of the BC locations industry until 1938, when Britain revised its quota system so as to exclude productions from the dominions as domestic content (MacIntyre, 1996, p. 132). The second stage of the BC locations industry did not begin until the early 1970s, when US directors such as Mike Nichols and Robert Altman moved their productions on location, in search of greater “realism” (ibid., p. 133). The development of the BC Film Commission and its ability to capitalize on the positive experiences of the early US directors and producers who had worked in Vancouver can thus be seen as the third and most enduring stage of the city’s evolution toward becoming a Hollywood service centre.

However, it is not the BC Film Commission alone that has guaranteed the longevity of the Vancouver locations industry. The provincial government committed to maintaining the necessary infrastructure by investing millions of dollars in the building of studio space, in order not to lose any potential productions for lack of production facilities. To keep the industry growing, the provincial government spent \$4.4 million to build studios in 1987. A one-time steel fabrication factory, The Bridge Studios (The Bridge) opened with four sound-stages and the largest special effects stage in North America, all facilities that enabled Vancouver to attract high-budget Hollywood features such as *Jumanji* (1995), *Alive* (1993), and the \$100-million Disney movie *The Thirteenth Warrior* (1999) (Leiren-Young, 1995a, p. S7). The government's commitment to maintaining a secure environment for runaway US production led to spin-off effects in attracting international capital investment in other studios and sound-stages. Two years after The Bridge was built, Stephen J. Cannell decided to make Vancouver the production home for his series *21 Jump Street*, *Booker*, and *Wiseguy* and built North Shore Studios to accommodate his production needs. At the time, North Shore Studios was the largest sound-stage in Canada and Cannell's confidence in Vancouver as a production environment provided the impetus for other LA producers to go beyond using the city as a temporary locations site and actually to move their television series production there. North Shore Studios would eventually become the production center for *The X-Files* until the show's relocation to Los Angeles in 1998. Later on it would also become the production center for Chris Carter's short-lived series *Millennium* and for the *X-Files* spin-off *The Lone Gunmen* (2001).

The provincial government further accommodated the interests of international capital investment in Vancouver in 1996, when it agreed to a partnership with Metro-Goldwyn-Mayer (MGM) Worldwide Television, which was undertaken in order to build a fifth sound-stage at The Bridge. The agreement allowed MGM a long-term lease on the sound-stage for the television series *Stargate SG-1*, which began production the following year. The MGM-government agreement met with mixed emotions from local Vancouver producers, who were not so much concerned with the growing amount of US production in the city as with the government's hesitancy to transfer some of the revenue into a fund that would support domestic film and television production. MGM's senior vice-president of television Mel Swopes responded to these concerns by stating: "When you look back at earth from space you see no borders and no boundaries. Let's celebrate our differences and build our global film-making community" (quoted in Wilson, 1996, p. C13).

It is statements like this one that fuel the arguments of those who see the locations and service industry as displacing domestic production and denying the sociocultural specificities of place, while Vancouver becomes assimilated into the Hollywood production structure. It is, after all, difficult to "celebrate our differences" when the concentration of effort appears to be directed at helping to produce another nation's stories. If we were to proceed from a purely economic perspective, the sheer number of US productions in Vancouver would appear to reinforce the perception of Hollywood's displacement of domestic production. However, unlike other forms of international capital and resource/production flows,

the “globally mobile” film and television industry does not merely “create and use up places for the purposes of production or consumption” (Nigel Thrift, quoted in Morley and Robins, 1995, p. 31). In other words, merely by filming projects in Vancouver, international producers do not first exhaust the labor, resources, or sites needed for domestic production and then move on to the next locations city, leaving Vancouver a depleted resource town, like the “rust-belt cities.” Rather, the production and post-production facilities built to support US runaways, as well as the skills and partnership networks developed throughout, persist and enhance the domestic regional television and film communities.

In fact, before British Columbia was able to attract runaway US production, local producers were dependent on the transitory whims of central Canadian broadcasters and policymakers to support and maintain any level of domestic television and film production in the province. The fact that there were fewer domestic productions prior to Hollywood’s arrival in British Columbia further contradicts the implication that foreign television and film industries somehow supplant the domestic. This was, indeed, the common grievance of most of the producers I spoke to during my fieldwork in Vancouver. Neglect from federal decision-makers and disparate access to financing were seen to be far greater barriers to developing local productions than the presence of the Hollywood production machine was. Ironically, many of the producers found that ancillary benefits from working within the US system, at home, somewhat filled the void left by the lack of federal support. In this respect, the training and the income derived from working on US projects were seen to be invaluable to these producers’ eventual plans of amassing the capital and connections required to stabilize their own production companies. This is the central contradiction of the US production presence in Vancouver: it absorbs labor and resources while simultaneously creating opportunities for local producers to fund and distribute their own programs independently.

This potential to develop cross-border and mutually beneficial creative networks has been largely overlooked in macrolevel analyses of contemporary global television production strategies. Rather, the emphasis within such production studies tends to reproduce the traditional core-periphery model of political economy arguments, wherein Hollywood’s domination in the global circulation of television programming extends now to the transnational colonization of those who labor to produce it. Indeed, placing the focus on what has come to be termed “the new international division of cultural labor” (NICL) tends to create the impression of a seamless regime of governance in which Hollywood (as a monolithic force) regulates the global television production and distribution chain through control over cultural labor, co-production treaties, marketing, and exhibition (Miller, Govil, McMurria, & Maxwell, 2001, p. 18). As the authors of *Global Hollywood* argue, the volume of runaway productions today is the culmination of a process that dates back to the 1940s and to the strategy of US studio executives to “avoid restrictions on expatriation of profits, [and] exploit government subventions and cheap, docile labor” (ibid., p. 56).⁵ The conceptualization of an emergent NICL provides important insights into contempo-

rary strategies of global capital flows in film and television production. However, it insufficiently articulates the constraints or opportunities that define the experiences of cultural producers working within the transnational television locations production infrastructure. Studios may indeed be searching for “docile labor,” but this does not guarantee that workers are unable to establish alternative networks and to exploit the resources of capital investment to their own interests. As Mark Banks (2007, pp. 26–27) underlines, such political economic analyses tend to “neglect subjectivity” altogether and “overlook the embedded social relations of cultural commodity production.” Indeed, his explication of the trend toward a “craft production style,” wherein smaller companies of creative professionals work both within and outside of the parameters of larger studio control, underlines the contradictions within capitalism – namely that, while executives desire to control labor, they must allow for a degree of autonomy if innovation and artistry are to flourish in the name of profit (*ibid.*, pp. 21, 29). Banks’ preference for the qualification “compliant” (*ibid.*, p. 36) as opposed to “docile” labor parallels my own analyses of the ways in which incorporation into the strategic interests of the US locations industry allowed the ancillary networks and the resources for creative professionals in Vancouver to foster the growth of independent production and distribution companies.

It is, nevertheless, important to note that discourses of commodity labor power in the runaway productions industry tend to reproduce the overdetermined dichotomy between above-the-line workers (“creatives”) and below-the-line workers (“crews”) in television production. Here critiques of runaway productions fall into two categories: (1) concern over the displacement of jobs for US technical crews when “Hollywood” goes on location in another country; or (2) a race to the bottom, economically speaking, since second-unit production crews in other countries are regarded as “docile” worker bees as long as they are willing to accept lower wages in exchange for the opportunity of employment on US productions. In North America, pessimistic accounts of runaway productions are thus depicted as extensions of global post-Fordist regimes of flexible labor, which are epitomized by outsourcing and international branch plants. Such characterizations of the negative impact of runaway productions provided a powerful rhetoric that, in turn, fueled a divisive politics, which positioned US and Canadian production unions into a state of competitive – if not combative – relationship with each other. This phenomenon can be witnessed in the intensification of US union lobbying, which followed the rise in actual volume of runaway productions to Vancouver. The extent of inter-city competition between Los Angeles and Vancouver reached its zenith in the mid-1990s, when then Mayor Richard Riordan, in partnership with actor Charlton Heston, announced the opening of the Los Angeles Film Office as part of a strategy to “bring the movies back home” (Haysom, 1996, p. A6).

Although the divisive components of transnational labor issues remain of central concern to our understanding of the complexities and contingencies of global runaway productions, it is also imperative to further explore the grounded micro-politics of the television industry and the more intangible cultural aspects of the new

creative networks and geographies that have emerged in the transnational televisual environment. As both Allen Scott (2005) and John T. Caldwell (2008) underline, the current challenges facing Hollywood unions are, directly, a result of the restructuring of the studio system in Los Angeles itself, as opposed to being merely the result of the flight of production to other countries. Over the last 30 years, Hollywood studios have moved their projects “out of house,” to smaller independent companies (even if these latter remain within the larger conglomerate) that form competing networks of flexible production; and such companies are increasingly defined by the use of non-union labor (Caldwell, 2008, p. 80). Moreover, the attempt to “redefine geography through symbolic references to the *space* of film and television work” (ibid., emphasis added) diminishes the importance of the more intangible cultural dimensions that weave through our understanding of the NICL. Caldwell’s fieldwork within the industry specifically highlights the importance of exploring the microlevel practices of production as those members of the industry who fall “below the line” are found to be contributors just as integral to the creative process of televisual storytelling as the writers, the directors, the actors, and the producers who are economically above the accounting “line.” Scott’s and Caldwell’s studies correspond well with a growing body of literature in the field of media cultural geography that moves beyond core–periphery explanations of global production practices, in an effort to understand the fluidity of, and the tensions in, the new transnational networks that define contemporary television.

Media Capitals, Creative Clusters, and Runaway Production: The Case of Haddock Entertainment, Canada

Curtin’s (2009) conceptualization of “media capital” is, arguably, one of the most cogent explications of the synthesis of cultural and economic factors that mutually inform the global television production and distribution landscape. As Curtin argues (ibid., pp. 112–116), today’s media industries are driven by tripartite forces informed by the “logic of accumulation,” “trajectories of creative migration,” and “forces of socio-cultural variation.” The concept of media capital accords advantage to those sites – global cities or regions – of media production that not only allow for the expansion of markets and productive resources (“the logic of accumulation”), but also rely on the creativity of a workforce that is equally dedicated to the task of cultural expression and to economic profit (“creative migration”). The significance of the third dimension – sociocultural variation – and the promotion of the “local” as a means to address “niche markets outside of foreign control and competition” are particularly significant insights, which speak to the shortcomings of political economic perspectives that reproduce world systems theory into the field of television production studies. Indeed, through

its emphasis on the sustained importance of national and local institutions as driving forces in cultural production, Curtin's explication of media capital contradicts the insinuations or accusations of imperialism, which underline many critiques of locations productions. In all respects, Curtin's depiction of media capital provides a far more compelling framework for understanding the logic of Vancouver as "Hollywood North" than the two other existing explanations of this mode of production do – either the more traditional "outsourcing" explanations or the "branch plant" ones. Illustrative cases in this regard are the story of Vancouver showrunner Chris Haddock and the continental success of his series *Da Vinci's Inquest*.

Haddock is, in many respects, the face of the contradictory forces that define Vancouver as "Hollywood North." Haddock grew through the ranks and established himself as a writer on the US runaway production *MacGyver* in the 1980s. Throughout the process, he became particularly familiar with the creative processes and constraints of both the Canadian industry and the US one. In the late 1990s CBC found itself in a crisis, with a dearth of dramatic series for the network's prime-time schedule, and it began looking at pitches from regional producers to complete the schedule for the new fall. Haddock's pitch for his new crime procedural *Da Vinci's Inquest* eventually won out against its competitors and, in the process, raised eyebrows as to whether the nation's public broadcaster had sold out to those who worked within Hollywood North. In other words, would this be a recombinant series that merely emulated US procedural ones, such as in the *Law and Order* (1990–) genre? The concerns were not without credence, given that the head of drama at the time wanted a series that would have "global legs" and thus the potential for international sales (Tinic, 2005). In the end, it was because Haddock was established within the runaway productions industry that he was able to sell to the national public broadcaster a series that was very locally specific – a fascinating contradiction. Moreover, the risks he was able to take while working with a public service broadcaster (PBS) would eventually lead him to sales in the restrictive US broadcast network market and to a subsequent opportunity to develop a series for CBS.

Da Vinci's Inquest drew on the real-life cases of Vancouver's crusading coroner and later mayor Larry Campbell. It was a no-holds-barred examination of the coroner's attempts to improve the conditions of existence for the people living in Vancouver's downtown eastside – Canada's poorest neighborhood – which was marked by homelessness, drug use, and prostitution. In fact the four-block radius of the neighborhood had the highest rate of human immunodeficiency virus (HIV) infection in the Western world according to the World Health Organization (WHO). These dark themes were filmed in a visual style that pulled no punches. In fact it wasn't unusual to see characters shooting up in scenes reminiscent of the 1996 British movie *Trainspotting*. This was not typical network prime-time fare. Yet *Da Vinci* became a breakout hit for the CBC; and its success was noted by a relatively new Vancouver-based distribution company – Thunderbird Films. Thunderbird was in the process of developing a niche within the "Hollywood North" production sector that would specifically market Canadian domestic programming of sufficiently high production

quality worldwide. Although *Da Vinci* had already been sold to 50 countries, Thunderbird was determined to get it into the US market. The company was relying on the industry's recognition of Haddock's name as a consequence of his experience in Hollywood North; but it was also relying on its own assumption that "American audiences [were] hungry for intriguing dramatic series that can simultaneously stretch the mind as well as entertain" (Thunderbird Films, 2005). Thunderbird Films eventually collaborated with the LA-based distribution company Program Partners to sell the series to CBS, which was facing a crisis in syndicated programming due to an overreliance on reality television programming.

At first CBS was reluctant to take on such a dark series, but Program Partners was able to sell the network on account of Haddock's being a familiar figure within the Hollywood structure, both through his writing of *MacGyver* and through his development of the critically acclaimed but short-lived US series *The Handler*. It was this ability to speak to Haddock's cross-border production experiences that solidified the sale of *Da Vinci's Inquest*, which not only resulted in ratings that exceeded all network expectations (beating out *CSI: Miami* and *Alias* in syndication) but also garnered that all important promotional buzz from national television critics such as the *New York Times*, which hailed it "as like nothing else you've seen on television." The success of *Da Vinci* solidified the relationship between Thunderbird and Program Partners to such an extent that the latter now distributes to US networks several Canadian procedurals, under its brand "Crime Watch" (Nordyke, 2006).

Haddock and his production company, Haddock Entertainment, form but one cursory example of the cross-border creative relationships that have emerged through the auspices of the continental runaway productions industry. Nevertheless, it is an instructive case of what Aida Hozic (2001) has described as the move to a "merchant economy" in global television production strategies, whereby the power of distributors increases in the expansion of supply, as opposed to the expansion of production. Although Vancouver, *qua* Hollywood North, may yet await the ascendance to the status of media capital that Curtin depicts, it very much corresponds to the definition of emergent creative cities and networks, as given by M. E. Porter (2005) and Terry Flew (2007). As Flew notes, it is often within the so-called "second-tier cities" that we see the most entrepreneurial cultural industry practices: these practices draw the most skilled and globally mobile labor into an intersection between creative and economic sectors (Hans Mommas, cited in Flew, 2007, p. 186) that actually extracts resources from the "first-tier" global cities. In a seeming correspondence with Richard Florida's (2005) definition of "creative cities," Haddock himself articulates the ways in which "production cities" move beyond reductionist core-periphery exhortations:

A lot of people in the US have said to me they would like to have what I have – which is complete creative freedom – and not have to live in LA. And just as soon as we make it easier for people to do that – with tax relief – then it [Vancouver] will become one of the three or four great cultural cities in the world. (Quoted in McNamara, 2004, p. F1)

While Haddock's sentiments speak to the maturation and entrenchment of Vancouver's position within the larger continental film and television production geography, his statements echo several of the problems raised by creative city boosters, including Florida. In this respect, there remains a line between those who are seen to "create" and those who labor to enable the cosmopolitan mobility of show-runners such as Haddock. To a great extent, the production workers "below the line" remain place-bound and dependent on the success of domestic producers, executives, and distributors, who are committed to the continued growth of their immediate communities. Yet, precisely in this regard, case studies that examine the particular circumstances of local-global production practices provide important interventions and elaborations for more macrolevel analyses of the globalization of Hollywood's production strategies. In brief, there are no guarantees, and questions of space and place are integral to our understanding of the contradictions that are inherent in the transnational objectives of global capital. Here, to reinforce Banks' (2007, p. 27) argument, we must remain attuned to the questions of subjectivity, as creators/laborers are active agents in the "personification of class relations and alienation" and thus represent varied and differential commitments to communities of production across the exponential rise of cities competing to be the next "Hollywood North."

The International Production Ecology

Vancouver is in many respects an anomaly in Hollywood's runaway production sphere. As a center of production, it affords more comparative advantages than most of its competitive cities, states, and countries (ranging from Louisiana, New Mexico, and Michigan in the United States to Australia's Gold Coast and Auckland, New Zealand). Location is the primary advantage, both in terms of proximity to Los Angeles and in terms of locations regarded as physical settings; but the commitment to maintaining state-of-the-art studio space, special effects, and post-production facilities has also betowed upon the city a "home away from home" quality, which enhances the two-hour commuting time back to Hollywood. And, contrary to arguments about inexpensive or "docile" labor, Vancouver continues to draw Hollywood productions despite a global recession and equivalent currencies. Given the combination of highly trained and productive crews (still remunerated under union regulations) and tax incentives, the province saw an increase of \$250 million in total spending, to the total of \$1.2 billion, from one year to the next (BC Film Commission, 2009). In fact the US network series *Fringe* (2008–) moved to Vancouver in 2009, after failing to garner favorable production circumstances in New York (Thielman, 2009). To this extent, Vancouver has become a model for other cities and countries that attempt to attract runaway locations productions. In recent years the most striking parallels have been between Canada on the one hand and Australia and New Zealand on the other. All three countries share similar concerns with regard to small domestic

markets and national cultural goals for network broadcasting. In fact Australia has followed Canada's lead where the "plasticity" of locations promotion is concerned (Landman, 2009, p. 143). In this respect AusFilm, the equivalent of the BC Film Commission, has created a "map" of the country that substitutes the nation's regions with recognizable international locales, particularly those of the United States, just as *The Shooting Gallery* does (see above, p. 475). However, it is difficult to trump the success of New Zealand's work on the 2001–2003 trilogy *The Lord of the Rings*, where the runaway locations industry has shown the global industry that anything is digitally possible. Nevertheless, to end on a cautionary note, Vancouver's apparent success as a global model for the synthesis of global and domestic television and film production should not be seen as an easily replicable formula, or as a panacea for government divestment in the cultural sphere in small-market nations, or as an engine of growth in US states. The story of Hollywood North was a 30-year process that began with economic incentives but only truly came into its own once the technical infrastructure and face-to-face personal networks had been established. Indeed, it was the micropolitics of cultural exchange, on the ground (so to speak), that make Vancouver difficult to pinpoint (or emulate) in larger structural analyses of the new international division of cultural labor in the global television and film industries.

NOTES

- 1 In 1996 I conducted a one-year fieldwork study of the development of the US runaway locations industry in Vancouver, British Columbia. The central objective of that project was to determine how regional producers reconciled the economic and aesthetic requirements of a globalizing media industry with the nationalist goals of Canadian broadcasting policies. The project integrated three components: (1) in-depth interviews with members of the Vancouver television industry, including locations scouts, broadcasting executives, television development personnel, and program managers; (2) archival research on Canadian television programming and policy and analysis of discourse in the industry trade publications; and (3) textual analysis of television programming. This chapter contains excerpts from work I have published on that study: see Tinic 2005, 2008.
- 2 Fordism is defined by the system of assembly line manufacturing of standardized, mass produced commodities that dominated the economic systems of Western countries until the 1970s. Post-Fordism has come to designate new regimes of production and accumulation under process of economic globalization, namely the trend toward global outsourcing of production, the growth of knowledge and technology economies, and just-in-time production of specialty products for global niche consumers.
- 3 Although the phrase "runaway production" has most recently and explicitly been linked to US television and film productions in Canada, there is a long history of economic "runaways" from Hollywood. After World War II, countries throughout Europe found themselves economically disadvantaged in the cultural production sphere and, given the established domestic quotas on imported television programs and films, they established the cost-sharing template for international co-productions that exists today. Moreover, any local subsidiary of a foreign production company was allowed domestic tax incentives

and subsidization. As a result, many US productions moved to Europe to take advantage of the economic incentives and bypass import quotas. Aida Hozic (2001, p. 96) notes, it was US unions that first coined the phrase, calling these “runaway productions,” as the number of such productions tripled between 1949 and 1960.

- 4 Neoliberal discourses maintain that free-market policies – rather than government- or state-sponsored programs and subsidies – provide the most efficient means of delivering social and economic benefits to societies at a global level. These discourses advocate trade and production liberalization in a global economy and regard the private sector as the preferred provider of goods and services. Neoliberalism emphasizes individual autonomy and responsibility and the transference of all risks to the individual.
- 5 Jefferson Cowie’s (1999) historical analysis of Radio Corporation of America (RCA)’s persistent search for inexpensive labor for its radio and television manufacturing plants is an excellent reminder that the issues raised in arguments about the NICL are not new to a post-Fordist global economy. Beginning in the 1930s, RCA moved its factories from New Jersey to Indiana, to the Southern United States, and eventually to Mexico in the 1990s, in response to the workers’ capacity to organize and resist exploitation. Not only does Cowie illustrate the micropolitics of laborers’ negotiations of economic constraints; he emphasizes that all inter-city competitions for capital might better be described as processes of “transregionalization” than looked at through the more demarcated parameters of “transnationalization” (ibid., p. 2).

Youth as Cultural Producers / Cultural Productions of Youth

Lora Taub-Pervizpour

ABSTRACT

This chapter offers an introduction to the diverse field of youth media production and practice. To do so, it begins with a consideration of the “crisis of voice,” identified by Nick Couldry in his book *Why Voice Matters: Culture and Politics after Neoliberalism* (2010). In relation to this crisis and to the systematic silencing of young adults from low-income communities and from communities of color, media making is explored as a field of practice within which young people gain access to critical resources for raising their voices. The chapter brings these issues into focus through an ethnographic study of a youth media program for economically and racially diverse adolescents in Allentown, Pennsylvania.

In his book *Why Voice Matters: Culture and Politics after Neoliberalism*, Nick Couldry (2010) begins his bold project – that is, the project of naming a “crisis of voice” – from Paul Ricoeur’s claim that “we have no idea what a culture would be where no one any longer knew what it meant to narrate things” (1984, p. 28). The contemporary crisis of voice documented by Couldry has its genesis in the global ascent of neoliberalism in the 1980s and has by now insinuated itself into all domains of the social world, so we can discern it in the realms of politics, economics, and culture.

Treating people as if they lack [the] capacity [to narrate their lives] is to treat them as if they were not human; the past century provides many shameful examples of just this. Voice is one word for that capacity, but having a voice is never enough. I need to know that my voice matters; indeed, the offer of effective voice is crucial to the legitimacy of modern democracies, while across economic and cultural life voice is offered in various ways. Yet we have grown used to ways of organizing things that ignore voice, that assume voice does not matter. (Couldry, 2010, p. 1)

Couldry argues that the doctrine of neoliberalism fundamentally “reduces the complexities of what it describes” and “presents the social world as made up of markets, and spaces of potential competition that need to be organized as markets, blocking other narratives from view” (ibid., p. 6). Within this context it is “consumer choice,” not “voice,” that has value. Market forces matter, while the potential social force of an engaged citizenry is suppressed.

In the US, no other group is told as often as youth is that its members’ voice does not matter. And no group is more excluded than youth from the possibility of having an effective voice. Young people fare worst of all in relation to neoliberal politics, which commodifies all facets of their everyday lives at home, at school, in communities, and in the wider culture of childhood. Neoliberalism values young people only in so far as they wield any degree of consumer power. The crisis of voice under neoliberalism is experienced most acutely by children and young adults from low-income communities and from communities of color, who are systematically rendered voiceless. Henry Giroux and others have identified the extent to which education advances neoliberal reasoning.

Central to the hegemony of neo-liberal ideology is a particular view of education in which market-driven identities and values are both produced and legitimated. Under such circumstances, pedagogy both within and outside of schools increasingly becomes a powerful force for creating the ideological and affective regimes central to reproducing neo-liberalism. (Giroux, 2004, p. 494)

This chapter attempts to document the particularities of this crisis of voice for low-income African American and Latino youth in Allentown, Pennsylvania who participate in HYPE – the Healthy Youth Peer Education program. HYPE uses digital media tools in the service of identifying, raising, and sustaining the voices of marginalized youth and brings these voices to bear in public conversations about healthy communities. HYPE is a collaboration among local institutions, professionals, and students engaged in a collective effort to explore what it looks like when communities choose to value the voices of young people who have been systematically silenced. By constructing a space in which young people can name and critique the ways in which they are silenced across multiple social institutions – school in particular – HYPE makes young people and adults join as allies in the difficult task of imagining a social world where teens’ voices do matter. This chapter describes one local response to Couldry’s call to action:

Treating voice as a value means discriminating in favour of ways of organizing human life and resources that, through their choices, put the value of voice into practice, by respecting the multiple interlinked processes of voice and sustaining them, not undermining or denying them. (Couldry, 2010, p. 2)

I also wish to suggest here that youth media programs create the conditions of possibility to produce these stories, and therefore they hold a promise as sites of human activity from which an alternative to neoliberal politics can be built. HYPE is one example of a site socially organized to promote what Couldry identifies as “a counter-rationality voice” (ibid., p. 14). The work presented here explores the relationships between young media producers and the adults who ally with them in their cultural productions. To ally with young people in their media making is, at its best, to construct a process of valuing voice. Documentary fieldwork conducted with HYPE over three years underscores the important reality that providing access to new technologies and practices will have a limited meaning or impact unless the participants intentionally construct social relations that are more just and more humane, in the face of the inequities that frame adult/youth relations in their community and in the culture at large. In their cultural productions, HYPE youth have documented those inequities, showing how they shaped their marginalization in relation to the local police, the school authorities, the neighborhood residents, and corporate mass media. At another level, HYPE youth remind us of the imperative to build more just and more equitable relationships *within* the sites and practices of media production.

Youth Media Production: Frames of Reference

As a field of practice, the youth media body has a long history of promoting young people’s rights to become the narrators of their own lived experience. As JoEllen Fisherkeller’s (2009) survey of the field demonstrates in detail, youth media production varies in relation to the social, cultural, political, and economic contexts in which it occurs. A common driving force for much of this practice is the recognition that young people often have limited access to spaces that are organized to promote the very possibility of their raising the voice as citizens. The field of youth media was largely forged through local grassroots efforts made by advocates aiming to redress the exclusion of youth voices from public life.¹ As one practitioner notes in Ingrid Dahl’s comprehensive *State of the Youth Media Field Report* (2009, p. 8):

Those of us who come to this field have done so because we know at our core that working with young people, identifying issues of relevance for them, and guiding their media productions to be powerful tools of change is unmistakably a radical and essential movement in education.

Young people are producing stories across a range of media that document hopes, sufferings, losses, and longings that they experience directly or witness within their communities, and that are based on class, race, gender, ethnicity, and sexuality.² To be sure, these narratives offer evidence of young people's ability to imagine a future in which their voices are valued and their stories matter.

The role of electronic media in the lives of children has commanded the attention of scholars since at least the 1930s, when the Payne Fund Studies famously attempted to track the impacts of film – the “new media” of that decade – on young viewers. In that enduring history of concern, it is a relatively recent development that scholars have focused analysis on young people as *producers* of media not because young people's engagement in media production is new, but because there is academic bias toward consumption.

Young people have always participated in productive cultural practices. On the basis of decades of work in listening to children in various US contexts, Robert Coles (1998) argues that children have a “documentary impulse,” an inclination to play with the available tools of communication in order to make a record of what they have seen and heard in the world and to share it with others. Similarly, in *Girls Make Media*, Mary Kearney (2006, p. 24) details the history of girls' cultural production at the turn of the twentieth century, bringing to light extensive historical evidence that “American girls have long been involved in creative activities that, though often invisible to others, link them directly to the realm of cultural production.” Kearney claims that “American girls have always been culturally productive using various media to express themselves and for communication with others” (*ibid.*, p. 2). This is true today more than ever before – for boys and girls alike.

Still, the culturally productive activities of young people remained almost unexamined by scholars throughout the latter half of the twentieth century in favor of analyses focused on young people's consumption of media. In the 1980s and early 1990s, informed by some strands of cultural studies, scholars challenged the enduring stereotype of youth as mass media's naïve and passive recipients or vulnerable victims and stirred an interest in young people as media producers. In an essay reviewing key contributions to this burgeoning research literature, Vicki Mayer observes:

If the initial motivations of cultural studies scholars could be characterized as a concern with the ways that power operates through the production and consumption of popular culture, the new focus on young people as media producers seeks to understand how this once marginalized social group could play an active role in this dialectic. (Mayer, 2007, p. 404)

Once it was recognized that young people have agency – a limited one, but agency no less – the question *what do young people do with the media* broadened to include not only the engagement of young people as consumers, but their media making practices as well.

Researchers turned attention to youth as media producers in part to critique the extent to which young people's understandings of identity, community, and participation were situated within commercialized contexts. (Some efforts were surely born out of equal frustration with the near neglect of the production within scholarship on youth and popular culture). In the late 1990s, as "school reform" fundamentally restructured education around neoliberal politics and market incentives and childhood more broadly was reshaped in the image of consumer culture, critical media scholars could not but ask: What spaces do remain where young people are encouraged to think about themselves as more than consumers? In what social contexts do youth encounter models of citizenship not defined by consumption or shaped through by commercial forces? An expanding and diverse array of youth media programs (including radio, video, journalism, and other media formats and practices) located primarily in after-school community-based settings held promise as sites where young people could access the means of communication enabling them to produce their own mediatized accounts of the social world.

Several researchers have already attempted to map a significant and growing interdisciplinary literature on youth media production (Buckingham, Banaji, Burn, Carr, Cranmer, & Willett, 2005; Goldfarb, 2002; Goodman, 2003; Sefton-Green & Soep, 2007), writing from a variety of academic disciplines – media and cultural studies, communication, political science, sociology, education, literacy studies, and history. A good part of this literature is comprised of studies from youth media practitioners, whose frontline accounts deepen our understanding of the practices constituting youth media and question the (often) tenuous alliance of power between youth media makers and the adults who create the conditions for their cultural productivity. Not only are there many forms of youth media; there are also many paths to understanding and interpreting youth media. Much of this work is referenced and figures prominently throughout the present chapter.

In this section I want to briefly highlight just one of these pathways to understanding youth media – an orientation that, I think, avoids a troubling tendency to segregate youth media academics from youth media practitioners. The work I discuss here shows us that it is possible – perhaps even essential – to be rigorous about both: Mayer's *Producing Dreams, Consuming Youth: Mexican Americans and Mass Media* (2003), Ellen Seiter's *The Internet Playground: Children's Access, Entertainment, and Mis-Education* (2007), and various research articles by Glynda Hull and her colleagues in Oakland, California. Though they approach youth media production from different disciplines (media and communication, education), these authors share a simultaneous engagement as active practitioners/volunteers and researchers. At San Antonio Cultural Arts (SACA), Mayer volunteered her video and journalism skills to support a group of Mexican American youth to produce a video documentary, *Altars on the West Side*, while she studied the meaning of this work within the context of both commercial and alternative Mexican American media in San Antonio, Texas.

Around the same time, in an ethnically divided working-class community in southern California, Seiter helped construct a computer lab and an after-school newspaper

class in order to give children the communication access and the skills they needed if they were to represent their own lives and community and to use their own voices in doing it. Seiter explains the appeal:

The program allowed me to put to good use my knowledge of pedagogy and computers to benefit children who never dreamed of attending the universities where I received my training. By helping children develop a sustained interest in computer applications and Internet usage, I hoped the kids might see more benefits of education, and begin to imagine themselves as future university students. (2007, p. 20)

Teaching computing and journalism skills to community youth at this lab and in a more affluent suburban school setting for nearly four years, Seiter was able to closely observe children's computer and Internet use. These observations form the basis of her study of the intractable disparities among children in their access to and use of the Internet. Mindful of Clifford Geertz's (1988, p. 6) assertion that ethnographic writing usually "consists of incorrigible assertion," Seiter argues:

The legacy of action research is to expand the children's sense of the possibilities, the rewards and the experiences that await them if they can stay the course and make it to college. Professors can learn a tremendous amount from extended and extensive contact with young students and the public schools in which they struggle. Such work can have an invigorating effect on academic theories of ideology, of identity, and of the role of media and technology in everyday life. (2007, p. 105)

In 2001 Hull co-founded with Michael James a community technology center in the heart of an urban neighborhood in West Oakland, California. At Digital Underground Storytelling for Youth (DUSTY), Hull – a professor of education at the University of California in Berkeley – collaborates with community partners to design and study after-school programs for youth on digital, multimodal, multimedia composing. DUSTY's purpose is to create an alternative educational space where youth can develop an authorial and agentive self. In Hull's work there is a seamless connection between advocacy and scholarship on young people as media makers. The lines between them blur – in the following explanation given by Hull, Kenney, Marple, and Forsman-Schneider (2006, p. 8):

Children are the most constrained of all social actors; parents and caretakers, schools, and society regulate their activities and choices. Yet children are indeed agents in their own social worlds. As they grow, they claim more and more autonomy as social actors. We are interested in the role of multimodal learning and expression in this process, as well as the role that an afterschool program can play when it provides structures that allow children to exercise agency.

I would argue that the authors discussed here share a self-conscious effort to direct the resources and energies of their academic institutions to projects that begin to

redress the information inequalities in their communities. Seiter (2007, p. 102) writes of her youth media partnership as “only one of many that offered academics an opportunity to be useful, to share some of the wealth concentrated at universities,” in a wider effort to address the unequal distribution of technology and educational resources in the US. The works included here are models, because they help establish frameworks that inform the subfield of youth media production analysis and because they provide a model for rigorous analysis of young people’s cultural production within a broader social justice agenda. Indeed, the studies of Mayer, Seiter, and Hull et al. suggest the rich possibilities of youth media production as a leading edge in the wider media democratization movement.

If youth media are the leading edge in the battle for media democracy, what does that edge consist in? What imbues youth media with democratizing potential – the possibility of contesting neoliberalism’s denial of voice and its claim that only market value matters? An overlapping emphasis on process is unmistakable across the work of Mayer, Seiter, and Hull et al. Reflecting on her experiences both as a volunteer and as a researcher collaborating with Mexican American youth on a video project in San Antonio’s west side, Mayer stresses that products are significant, but not as much as the process of making them is: “Grassroots video projects do not create citizens. Rather, they are places that potentially reinforce the ways that people feel like members of a community” (2003, p. 115). Hull and colleagues (2006, p. 8) at DUSTY in Oakland, California reflect on how, through “the design of our curriculum and participant structures, we position digital storytellers as authors, composers, and designers who are expert and powerful communicators, people with things to say that the world should hear.” The influence of educational theorist and activist Paulo Freire’s concept of critical consciousness is evident both in Seiter’s after-school journalism/Internet program and in Hull’s DUSTY. In describing this critical orientation, Seiter writes:

In an adaptation of Freire to the environment of new technologies, the goal is to encourage children to conceive of the Internet as more than a game machine or a new delivery system for music, television, and film, and entertainment-industry publicity. My hope was to encourage children to use the Internet as a means of voicing their nascent critical consciousness. (2007, p. 21)

According to Hull and James, DUSTY’s curriculum and pedagogy encourages young people and adults to position themselves “as local and global community members able to remake their worlds” (Hull & James, 2007, p. 5, citing Freire, 1970).

Mayer’s study draws out another facet that makes the three studies cited here exemplary: a necessary and nuanced understanding of the relationship between consumption and production. While focusing on her collaborations with Latino youth in their video production, Mayer does not ignore the fact that “commercial mass media were omnipresent in the daily activities” of the teens, who “talked about

media constantly” (2003, p. 119). Mayer, Seiter, and Hull et al. each recognize, in their respective involvements with youth media, that the consumption of media and of popular culture powerfully contributes to the context in which production takes place. Mayer describes this with a transparency understandable to anyone who has sat beside a teen to log a videotape. “Much of my own work with the young volunteers at SACA relied on our common media interests; logging video footage did not seem so boring if we could talk about Justin Timberlake or the latest Spanish-language telenovela” (ibid.). In this way, Mayer argues, consumption is productive, and her participant observation and interviews recapture the dynamic interplay of media consumption and production in the lives of the Latino youth with whom she worked, “citizens who consume mass media but also desired an alternative to them” (ibid., p. 118).

Anne Haas Dyson first drew attention to the value and meaning of children’s affinities for popular culture within the spaces of learning in her 1997 book *Writing Superheroes: Contemporary Childhood, Popular Culture, and Classroom Literacy*. Dyson’s ethnographic study of writing practices in an elementary school in Oakland, California shows how children used popular culture – for example the television show *X-Men*, commercial music, and football – as writing subjects and resources for building “webs of connection” with others. “Writing was not so much an expressive medium for individual souls as a tool for social beings whose major concerns were not learning to write” (Dyson, 1997, pp. 42–43). The complicated social processes at play discerned by Dyson helped Seiter make sense of the fact that Worldwide Wrestling Entertainment (WWE) was always the first writing topic of choice among Latino boys in her computer lab. Looking at wrestling in its cultural, historical, political economic context, and in the context of her ethnographic and longitudinal research, Seiter avoids the trap, common among critics, of seeing only the sex and violence in the WWE. Seiter untangles the issues of class, race, and gender, which bind Latino boys’ consumption of WWE to their journalism productions. “If our official curriculum focused on learning research tactics on the Web and the genre of newspaper writing, the boys’ writing about wrestling reflected their unofficial work of shoring up identity and creating a space in which they could feel powerful” (Seiter, 2007, p. 65, drawing on Dyson).

The scholarship introduced above resonates with Couldry’s impassioned call for spaces that put the value of voice into action. Mayer, Seiter, and Hull demonstrate that having a voice is not enough – the rich, textured, and sometimes troubling accounts of young people’s storytelling documented by these three researchers exemplify what it means to listen to young people and to communicate back to them, transmitting the message that their voices matter. Like Couldry’s, my argument is that we don’t just need more youth media: we need to create opportunities for more youth to witness the democratic possibilities of their media within their local communities. Expressing a self-declared, hard-earned pessimism about technology and education, Seiter asserts:

The time for technological utopianism is past: we need to be clear and precise about the goals and the feasibility of technology learning, in the context of a realistic assessment of the labor market and widening class divides, struggles for fair employment in both technology industries and other job sectors, and the pressing need to empower students as citizens who can participate actively in a democracy. (2008, p. 50)

To be sure, media and communication researchers can contribute to the difficult work of constructing spaces where youth voices are being heard and valued. Fisherkeller (2009, p. 25) has urged media and communication researchers to “help youth media by encouraging the support and maintenance of programs already existent and by envisioning new kinds of creative and strategic partnerships and collaborations among youth media programs and media and communication researchers.” In the remainder of this chapter I turn to one such collaboration, in Allentown, Pennsylvania – where, since 2006, I have worked with community partners to grow and sustain a youth media program called HYPE.

HYPE: Context and Method of Study

HYPE offers youth of high school age opportunities to engage in social change and public advocacy through leadership development, digital storytelling, the performing arts, and documentary media. Participants live in the predominantly low-income and racially diverse neighborhoods of Center City Allentown.³ In the first section of what follows I focus on program activities during the summer of 2009, when six Latino and six African American youths between the ages of 15 and 20 participated in HYPE. The group consisted of three young men (Rashid, Anthony, and Jamie) and eight young women (Alyssia, Jessie, Sheridan, Dahlia, Gabby, Shaniqua, Clarice, and Amanda). The study draws on the qualitative methods of participant observation and documentary fieldwork and includes data from field notes written by the researchers and other HYPE staff members, a range of documentary sources, and unstructured interviews with three HYPE students; the interviews were conducted by Eirinn Disbrow, an undergraduate research intern. Disbrow also conducted in-depth interviews with Jenna Azar, HYPE co-director, and with education scholar Michael Carbone, who, as chair of the education program at Muhlenberg College, where HYPE is located, has extensive knowledge of the culture and politics of the local public school system. The documentary video produced by the HYPE teens in the summer of 2009, *Roots of Change*, also provides important insights for considering the possibilities of valuing youth voices in Allentown.

Figure 22.1 Preparing for person-on-the-street interviews, HYPE teens are empowered with cultural tools for storytelling. *Source:* Jenna Azar, HYPE Co-Director, Healthy Youth Peer Education.

Power and Powerlessness Behind the Camera

HYPE offers a safe and supportive context for learning and development, where young people have possibilities to raise their voices and name their concerns about problems they see in their community. I conceive of this as a “third space,” as theorized by Kris Gutiérrez (2008), by Glynda Hull and Katherine Schultz (2001), and by others – a site where different activity systems (school, community, family, university) collaborate to create a context that promotes the formation and negotiation of new roles, relationships, learning, identities, and – above all – voices. HYPE students overwhelmingly view the community as unwelcoming to young people in general, and adults as mistrustful of low-income youth, in particular those of color. Person-on-the-street interviews conducted by HYPE on a summer morning confirmed this perception. In the words of one middle-aged White male interviewee: “What do I think of teenagers? Buncha hoodlums, that’s what I think.”

No experience demonstrated better how disempowered HYPE students feel in the face of authority than the interview they conducted with the principal of the largest public high school in the local school district. The interview team – Amanda,

Dahlia, Shaniqua, and Sheridan, accompanied by Disbrow and Azar – traveled the eight blocks between HYPE and the high school by car, equipped with camera, microphone, and a list of carefully scripted questions. The interviewers were visibly anxious as they sat in the principal's waiting room. When he entered – a large and gruff man with a thick grey, walrus mustache and wearing an oversized school jersey – all of the girls froze in silence. Doing nothing to put them at ease, he cleared his throat: "Well?" Urged by Disbrow, they mumbled their names, averted eye contact, and filed behind him into an office crowded with memorabilia in the school spirit. The girls quickly sank deep into their seats, leaving Disbrow to set up the camera. Amanda held the sheet of interview questions and positioned her chair next to the principal, but out of the camera frame; she was more reticent and nervous than she had been conducting person-on-the-street interviews earlier in the week. Disbrow asked many of the follow-up questions, hoping to provide a model for the teens to adopt. But they said very little, and the principal made no visible effort to engage them or to quell their discomfort. The interview footage reveals some of the issues of power and ethics that emerge when young media makers turn their cameras on the adults who have very specific forms of authority over their lives.

Early in the interview, when asked about the difficulties of his work, the principal shares that his greatest struggle is "getting kids involved" in extra-curricular activities. He barely mentions a notorious lack of resources before turning to speak at length about the importance of non-academic after-school activities – band, football, theater, music. This was one of the few times when Amanda veered from her interview script to ask (with evident disbelief and with her own young awareness of larger issues at stake), "Do you think the reason they're not involved is because they choose to be or because the resources aren't there?" The principal replies, "It's a choice thing. These opportunities are there. It's just a matter of kids choosing." Amanda presses on: "Do you think they are motivated [to participate]?" "Well, that's a deeper question. What is motivation?" After an awkward silence, the principal at last acknowledges that "it's tough for our kids. A lot of them have commitments after school, a lot of things beyond their control," but he emphasizes that "it's up to each individual student to make the most of the opportunities we provide."

The principal claims that "fun kids" are the best part of his job, but the girls themselves experience the school as anything but fun, and as deeply unwelcoming. Education scholar Michael Carbone finds the interview footage striking for the complete absence of any conversation about academics. "He doesn't see these kids as potentiating into anything, as emergent adults," explains Carbone, who oversees student teachers placed in the district.

It's disingenuous to talk about the kids' participation. If I were a kid, I'd be thinking, "this is my responsibility?" No, it's the responsibility of the school to be inclusive of all young people and to create a space and activities that are responsive to students' academic needs and interests.

This underlying injustice shaped the teens' interview with the principal. Initially eager to conduct the interview, the teens stated after the fact it was really "a waste of time," meaningless, and ultimately disempowering.

In the institutional context of the inner-city school, the "principal's office" is almost always marked as a space of conflict, punishment, and control, not a space that values youth voices. Jenna recalls the interview experience:

The kids were quiet, they were compliant, they weren't asking any questions that were harder than what they wrote down. They weren't pushing at all, and so in terms of the way that urban institutions are set up to educate youth – that is what you saw. *They were maintaining order.*

One of the interviewers, Shaniqua, sat captivated by the principal's power: "I was thinking about while he was talking [how] there are so many kids in that school and it's just him that has the authority over them and that's it." *That's it.* Steven Goodman (2003, p. 25) astutely claims that "urban high schools are taking on the look and feel of prisons," and there is little doubt among the HYPE girls that the principal looks and seems like the head security guard. In trying to make sense of the dynamic during the interview, Azar reflects, "What you see when young people come up against power [is that] they only have a few options, and most of the time they chose the power of disengagement, the power of not caring."

It would be wrong, however, to see this disengagement as "apathy," a common complaint lodged against young people. In their long-term "Public Connections" research project in Britain, Couldry, Sonia Livingstone, and Tim Markham (2007, p. 5) share a similar stance. "Rather than blaming young people for their apathy, the finger might instead be pointed at the online and offline structures of opportunity that facilitate, shape and develop young people's participation." Listening closely to young people in focus group interviews, these authors find that "[y]oung people protest that 'having your say' does not seem to mean 'being listened to,' and so they feel justified in recognising little responsibility to participate" (ibid.).

If HYPE teens felt excluded from any real conversation during the interview with the principal, reviewing and editing the interview footage offered a second opportunity to engage critically with the issues he dismissed and to determine how the principal's perspective would be included in their video. Back in the editing studio, implicit and explicit struggles over what to include and exclude quickly emerged. Amanda sat to review the footage with Sylvia, a HYPE college intern and a former student at the high school presided over by this principal. Sylvia recalls the complexities of that task:

When I listened to [the principal] talk, I tried to be as objective as possible because we had just talked with Lora [Taub-Pervizpour] about representing someone's voice as true as possible. However, when I heard some of his answers to questions concerning a possible relationship between HYPE and Allen or his alleged openness to hearing student opinion, I couldn't help but think it was just a show because there was a camera on him. Having come out of [that high school], only a few students know that it is even

possible to start a new club/program in the school and he favors AP/honors and sports teams. If you are not in those two groups, you are pretty much forgotten about. Despite these feelings, I still dragged the clips down and left them as possible ones for the final cut. I knew I probably wasn't going to do the final cut, so I left the clips for others to decide. (Email correspondence with the author)

Decisions about what to include and what to exclude are always subjective (Coles, 1998), and in this instance they reveal some of the tensions between adult and youth perspectives.

Working from clips identified by Amanda and Sylvia, a small group extracted a sound bite that triggered the program coordinator's concern. In her role as program coordinator, Azar was alert to the potential backlash that the young filmmakers (and students at the same school as the principal) faced if they were perceived to be portraying him in a negative or unfair light. She also warned about the risk of turning the principal against the program, which could potentially undermine wider community support. Jenna advocated that the teens recover the wider context of the clip, and they did so without protest.

Clearly, taking away young people's creative control over their cultural production runs counter to the goals of the youth media movement. Youth media educators share a responsibility to expand young people's right to communicate, not to impose further limitations upon that right. But Jenna's concerns reflect her awareness of our responsibility to ask the students critical questions that challenge them to think through the implications of their production choices. The teens were disillusioned by the outcome of the interview with the principal, and, although they were not particularly concerned about showing their principal in a negative light, they understood the practical and ethical dilemmas Jenna was identifying in the context of the bigger picture. The teens recognized the possibility that, if the principal disliked his portrayal in the film, he could shut down their voices at school and in the community. Locating conversations about the ethics of representation at the center of our work can empower young people to make production choices that serve the larger social justice objectives at stake. But these objectives need to be weighed against the aim of valuing youth voices – a *process* that, according to Couldry, is of urgent importance for the creation of a more democratic future. This was not, however, the only time in the process of producing *Roots of Change* that youth and their adult allies intensely negotiated conflicting visions and goals.

The Rough Cut: "This is Our Call to Action"

With just two days left until the public screening, the HYPE crew gathered to watch a rough cut that was assembled during the weekend from four distinct segments created by four smaller production teams. Prior to that moment, there was but a loosely shared understanding of how the segments would flow together. The long

silence after screening the 18-minute video was broken by one of the program's founders, an educator who was struck and dismayed by an overabundance of adults on screen. "I just don't get the sense of HYPE," she lamented, asking passionately: "Where is my HYPE?" This was a reminder that documentary is always a partial representation of reality; and she also underscored the multiple and sometimes competing visions/narratives held by adults and teens as they collaborate in youth media work. This was even more evident as HYPE teens weighed in with their impressions on the rough cut: Jessie disappointedly shared that it was not at all what she had envisioned; Jamie called it "boring and unimpressive"; Rashid looked crushed while offering a worried reassurance that "it's going to be okay." With the community screening just 48 hours away, things did not feel like they would be okay.

Jenna asked how the film reflected on HYPE itself and what image it transmitted to the community. If it were poorly received by the public, would the teens be vulnerable? Concerns about backlash and youth vulnerability are not unique to HYPE (see Gaines & Villarroel, 2010), but HYPE had very specific reasons to be cautious. When a short HYPE video examining the unfair treatment of youths by local police was featured at an official city event the year before, it angered an assistant police chief, who felt blindsided and blamed event organizers. Experiences like this one are powerful reminders that processes that attempt to value the voice of the youth will be threatening to those who hold traditional forms of power over them – the very power that functions by denying them an effective voice in their community.

The rough cut had the effect of raising the teens' voices and catalyzed them to assert their role at the center of the media-making process. They became animated about their vision for the documentary and committed themselves to doing the hard work ahead, in order to make it "their own." In the fast-paced and high-pressured environment leading up to the community screening, relationships between youth and adults were again renegotiated. As the teens looked for direction to Eirinn, a more advanced college student, she worried about having too big a handprint in their work. In some ways disappointment over the rough cut was a call to action, compelling the youth to participate more fully. They sat for long stretches of time editing at the computers, ignoring their vibrating cell phones or the lure of other online pursuits. Eirinn's interactions with the teens during this time were shaped by her own awareness of the need to deliver a completed documentary video that would meet the diverse expectations of youth and adult stakeholders alike. The responsibilities shared by adults and students in the production process has long been a subject of tension, writes Goodman (2003, p. 57) of his 20 years of experience with youth media at the Educational Video Center in New York City:

Students need to take ownership of their project and create something they will be proud of to show in public. But they can't be expected to move the project through all phases of production unassisted and on schedule. The teacher bears the ultimate responsibility for ensuring the group meets its deadline and the production results in a finished product.

As we came closer to the end of the production schedule, assistance and support from the adult educators was vital. Revisiting these last stressful moments of HYPE, Shaniqua recalls:

I think some of us just started giving up because it was just too much. Everybody was stressed, everyone was getting attitude with each other, people were crying. If we didn't have the adults there then I don't know what would've happened.

Shaniqua and her peers leaned heavily on Eirinn during these final days, as the students worked at the edges of their digital-editing knowledge and Eirinn tried hard to maintain their role of driving the production process. During a short afternoon break we took the opportunity to refocus and articulate our collective understanding of what was meant by “youth-driven/adult-supported” media production. On the chalkboard, we made a diagram of two concentric circles, one labeled “youth driven” and the other labeled “adult-supported.” The teens were asked: “What does *youth-driven* look like to you?” Their answers and descriptions filled the inner circle. We then asked, “What does *adult-supported* look like to you?” Their ideas of the kind of support they were expecting filled the space of the outer circle. This jointly produced artifact became an important guide in the remaining hours of HYPE, particularly in navigating the slippery border between adult support and control. Jenna highlights this ambiguity as she considered those final days and hours:

Would we [adults] be doing a disservice to the partnership [with the teens] if we were to sit back and watch and let them be creative but knowing in many senses that they wouldn't be successful [. . .] or maybe they would be and we've never given them a chance? When are we taking control because we need to and when are we taking control because we don't know how else to respond? Is it simply that we are not comfortable waiting to see what they come up with because it represents us as much as it represents them?

Clearly, adults need to take stock of what may be contradictory impulses and responsibilities shaping the production process. We want to encourage youth participants to take ownership of their work, which may at times collide with our obligation to protect the youth who participate in our programs. Constructing youth media programs around a framework for valuing voice requires both vigilant awareness of the interests and agendas of audiences for youth-made media and a keen sensitivity to the fine edge between “protecting” the youth and “censoring” their voices.

Youth Cultural Production: Negotiations

The rough-cut screening was tough on youth and adults alike. HYPE educators left conflicted responses to the conversation: excited, on the one hand, that the teens were roused to claim ownership of the documentary making process; frustrated, on

the other, that this newfound determination had not surfaced as strongly earlier in the five-week program. What responsibility did the teens bear for the disappointments of the rough cut? Some had simply not “shown up” for the documentary work, preferring instead to hang out or to pursue other online digital media practices at every opportunity – Facebook, MySpace, YouTube, gaming, and texting with cell phones.

Not only does this unsettled tension provide another moment for examining the ethical dilemmas that emerge when adult and youth agendas collide, it also raises important issues of class and race, which are embedded in the social conditions of HYPE. Many of the Latino and African American participants have limited access to high-speed Internet. While survey data from the Pew Hispanic Center and the Pew Internet & American Life Project suggest that the gap in home Internet use between white and Latino households may be shrinking – given the rising percentage of Latino households with broadband connections from 2006 to 2008 – disparities of access in households with annual incomes under \$30,000 persist (Livingston, Parker,

Figure 22.2 Exploring the community with video cameras in hand, HYPE helps teens develop a sense of themselves as agents of change. *Source:* Jenna Azar, HYPE Co-Director, Healthy Youth Peer Education.

& Fox, 2009). Access to computers in urban public schools is similarly limited by an absence of infrastructure and support and by the current organization of the environment around standardized curricula and high-stakes testing. Compared to computers in suburban public schools, those in urban schools are often older, and Internet access is slow and heavily restricted. By contrast, most of the work at HYPE takes place in a college room with 16 state-of-the-art Apple computers, high-speed broadband access, two printers, and a scanner. The multimedia production studio is similarly well equipped, with multiple high-definition video cameras, a mobile laptop system, and other production tools the value of which surely exceeds the average annual income of a high school teacher in the district. The draw of the technology for lower income students is undeniable (Seiter, 2007), and it is difficult to dismiss the teens' online activities as mere distraction from the "legitimate" media-making goals at hand.

Cell phones were ubiquitous at HYPE during the summer 2009 program, as was access to an array of digital media devices, including Nintendo DS and other handheld gaming systems, iPods, and MP3 players. While the teens mostly observed the rule that prohibits talking on their phones during HYPE, they were almost always connected via texting and Internet social networking sites. When they were working at the computers, they toggled between HYPE work in iMovie or GarageBand, for example, and MySpace, Facebook, YouTube, gaming or fan sites. For some scholars, these digital media practices signal a new kind of creative production for youth. Patricia Lange and Mizuko Ito (2009, p. 261), for example, argue that online media practices constitute a kind of creative production in the digital age, suggesting that, "for most youth, profile creation is a casual activity in defining a personal web page and graphic identity, pieced together with found materials on the internet. This is a form of messing around that can provide some initial introductions to how to manipulate online digital media." Henry Jenkins and his collaborators (Jenkins, Clinton, Purushotma, Robison, & Weigel, 2009) suggest that social networking sites and other spaces where youth create and share content online provide them with possibilities to engage in a "participatory culture." Within this conceptual framework, digital and online media are seen to comprise a "new media ecology," which has the potential "to reshape the conditions under which young people engage with media and culture, moving youth from positions as media consumers to more active media producers" (Lange & Ito, 2009, p. 244).

At HYPE we also recognize that, beneath the surface of this casual "messing around," there is an excitement to connect with new media that can be mobilized to engage youth in other forms of media making and can perhaps represent even "a starting point for broadening media production into other forms" (*ibid.*, p. 261). New opportunities to create personally and socially relevant content may be particularly meaningful for youth of color, in the context of an Internet that is, as Seiter (2007, p. 17) argues, "so heavily skewed toward white, English-speaking professionals who are interested in making purchases online." As a program, HYPE values the knowledges and experiences that youth bring to the table – and this includes, increasingly,

their experiences online. As media educators, however, we also have a responsibility to give students information about the limitations of these practices, situated as they are within a context of commodification that is notoriously relentless in targeting urban Latino and African American youth. Seiter (*ibid.*, p. 104) insists that media educators and researchers bear a responsibility to “teach children about the economics of the Internet” – for instance to make transparent the “hidden forms of commercialism” implicit in the business of mining and profiling on the basis of user-generated content.⁴ There are huge differences between online avenues and the streets one walks to get to school or to the store.

Beneath the hype of transforming youth into a “participatory culture,” social networking companies profit from the steady stream of content that users generate in the form of posts, photos, links, friends, and personal profile information. Nicole Cohen (2008, p. 7) is careful to note that, “[w]hile these sites can offer participants entertainment and a way to socialize, the social relations present on a site like Facebook can obscure economic relations that reflect larger patterns of capitalist development in the digital age.” Facebook, MySpace, and YouTube are very much a part of the institutions of media that form what Goodman (2003) describes as a system of authority, one that contributes to the criminalization and commodification of the urban working class and youth of color. Creating social networks online, meaningful as they may be, is no substitute for the daunting work of constructing a more inclusive community for these youth in Allentown. The longing for a voice to shape a more just community is deeply felt by HYPE teens, as exemplified by Jessie, a 16-year-old Latina student mentor in the HYPE program for three years.

Jessie’s Intro: “In a Short Couple Bars, It’s Like Exactly the Point”

Things never stay the same
They constantly change
Looking back at the past
It just rattles your brain
The way things form overtime
What will it take to form it
The way we envision it
In our minds
Teens are the future
So trust me enough
To let me shape the city with a mentor’s touch
With the help of children and adults
We will work together
To achieve results
A beautiful place with so much potential
If we took a stand

We'd sell the plans
 And the way it looks states
 That we can create
 A healthy community that we aren't seein'
 That can accommodate
 All Allentonians to be in.

Jessie wrote this rap two days before HYPE ended. They are the first words uttered in *Roots of Change* (HYPE, 2009), and they capture the teens' desire to make the film "their own." As Jessie and Rashid rap, Jessie and Shaniqua appear on screen, leaning out of the windows of Jenna's car as they drive through the streets of Allentown. The production process that shaped the intro sequence came as close as anything to HYPE's collectively defined ideal of youth-driven and adult-supported media.

Roots of Change opens with shots of Ccenter City Allentown⁵ – row homes, store-fronts, gas stations, an art museum, abandoned buildings – interspersed with close-ups of Jessie and Shaniqua gazing out of the car window at their community. Much like a music video, Jessie's rap lyrics drive the scene. She was outspoken in assuming responsibility for rewriting the introduction, although she had little experience of working with the editing software. For two days Eirinn sat with Jessie while she reconstructed the intro, providing just enough guidance with the program for Jessie to be able to render visually the ideas in her mind. From a youth media educator's perspective, this was rewarding work, with a passionate student actively creating the scene. At one point Jessie beamed, "I could do this forever."

Midway through her rap, Jessie asks: "What will it take to form it / The way we envision it / In our minds?" She is speaking of the community of Allentown, but the question is worth asking in relation to youth media. What does it take, in the context of HYPE and youth media more generally, to create conditions that empower young people to realize their cultural productions with greater autonomy and agency? What does it look like to create a process that values youth voices? A good part of the answer, to be sure, rests with Jessie herself, who demonstrated throughout HYPE a deep understanding of what it means to be in this community as a Latina, a teenager, and an advocate for social justice.

It's hard. The way school is set up, it's like a dictatorship. Even teachers say, "This is not a democracy, it's a dictatorship." At HYPE, I feel like we learn how to have relationships with adults and we work *with* them and then at school we have to work *for* them.

Jessie managed to locate herself in relationships with HYPE adults as an active participant and partner. We recognize, however, the difficulties HYPE students may encounter when they are challenged to rethink their view of themselves and their relationship with the community beyond HYPE.

Jessie felt these pressures acutely in the context of her home life:

EIRINN: How does HYPE affect other areas of your life?

JESSIE: Well, actually, it gets me in trouble a lot with my Dad because we get into arguments and he tells me not to talk back and I'm like, "I don't go to HYPE to learn how to be quiet! I have my own voice!" And then he tells me to shut up [laughter]. But the way we practice stuff [at HYPE], it's really comfortable. It's not like at school where we have to [sit there] and take notes.

EIRINN: What was your favorite memory from HYPE this summer?

JESSIE: Filming the intro. I was just really excited and I had a vision. Filming it was really fun because it was like exactly what I had in my head, and then adding the rap – it just made it that much better. That was my favorite part, like every time I watch it I just tell everybody, "This is my part! I did this!" I do love that rap too [. . .] I feel like in a short couple bars, it's like exactly the point.

Listening deeply to Jessie, Eirinn gets as close to her vision as possible and supports her as she acquires the skills necessary to render the vision so that others may be able to see it. Years of experience at Educational Video Center have demonstrated to Goodman that media educators must constantly manage and assist the media production work with youth without overstepping their boundaries, by "leaving little room for youth decision making or ownership" (2003, p. 104). The collaborative meaning-making process driven by Jessie and supported by Eirinn is a promising response to Jessie's refrain: "What will it take to form it / The way we envision it / In our minds?"

Jessie and her peers completed *Roots of Change* just in time for a community screening attended by family, friends, college professors, public officials, and community leaders. It was received with much praise; one young girl in the audience asked the HYPE filmmakers: "How can I be like you?" The film's message was powerful, the filmmakers' voices were impossible to ignore, and in the space of the screening they briefly experienced a community that actively valued their voice. As Jenna pointed out:

These teens are out there challenging stereotypes. I can't tell you how many times I've heard from people, "Racism doesn't exist." That's where it becomes absolutely a social justice issue, when these teens are heard, because they are the ones that experience so much of [the stereotyping and racism] on a regular basis.

The young producers' longing to shape community change infuses the multi-voiced narrative in the documentary's final sequence:

There need to be more opportunities for us to go out and advocate and be the mentor that we were trained to be. (Jessie)

It's so when you guys leave – you meaning the audience – you don't just say, "Oh yeah, that documentary was nice," and then go outside and just think about it for two

minutes and you're changed for that two minutes you go outside, but to help us because we can't do this alone. Teens too – don't go out and be like, "Yeah, I saw this cool doc and then I went home and nothing happened." You can be a part of something like this. Do something you know is going to positively change Allentown – that's why we're making this doc. (Clarice)

We want to go out into the Allentown community and start changing it – start shaping it – start working in it to create a better tomorrow, but we can't do it without the help of the citizens. (Jessie)

Conclusion

If youth media is to fulfill its promise as a force for valuing voice and creating particular conditions through which young people and adults are allied in this goal, it will require us to reflect constantly on our objectives, methods, and – crucially – the social relationships that shape youth cultural production. Whether we call it youth-driven, youth-made, or youth-created, it is up to media educators and students to articulate collectively what is meant by these terms and how their meaning is constituted through our media-making practices. Then we have to work hard at constructing relationships that do justice to the democratic ideal of young people raising their voices and being valued as cultural producers and participants in community life. As Goodman (2003, p. 112) observes: "We have come quite far. But damn, we still have a long way to go."

ACKNOWLEDGMENTS

The voices of many community partners informed this research, and the author acknowledges in particular the Healthy Youth Peer Education (HYPE) teens who share their perspectives through media production; HYPE co-director Jenna Azar; HYPE undergraduate interns Eirinn Disbrow, Sylvia Boateng, Joanna Whitney, and Stephanie Lamb; faculty from the Departments of Media and Communication and Political Science at Muhlenberg College; and HYPE founders Abby Letcher, MD, and Roberta Meek. The author recognizes the generous support for HYPE from Muhlenberg College, the Dorothy Rider Pool Health Care Trust, and the Program for the Funds for the Improvement of Post-Secondary Education. The author is also grateful for Sara Vignieri's close reading and editorial suggestions. An earlier version of this work, co-authored with Eirinn Disbrow, appears in *Media and Social Justice*, edited by Sue Jansen, Jefferson Pooley, and Lora Taub-Pervizpour (Palgrave MacMillan, 2011).

NOTES

- 1 While some high-profile national – and even global, corporate-driven – youth media campaigns have emerged, the complicated relation of this development to the history of youth media is a subject for another paper. See, for example, Adobe Foundation, “Adobe Youth Voices,” <http://youthvoices.adobe.com>.
- 2 Much of this work is represented in the *Youth Media Reporter*, the leading multimedia Web journal for practitioners, educators, and academics working in the field of youth media. See the journal’s website: <http://www.youthmediareporter.org>. The last issue of the journal was published in March 2011, but past issues dating back to 2005 are archived online.
- 3 This area has been the focus of significant community development initiatives and funding efforts, through which it has been designated a “Weed & Seed” area. More recently, through a collaboration among various philanthropic foundations in the region, it was designated a “Youth Empowerment Zone.”
- 4 Seiter’s study concludes with a compelling list of recommendations that media educators, teachers, and parents can leverage in activities that aim to educate children so as to make them think critically about the Internet. See Seiter (2007, pp. 103–106).
- 5 Center City refers to the downtown and business area of Allentown, a densely populated and multicultural neighborhood that is currently the focus of an urban renewal effort.

“What’s TV Good For?”

Views of Producers of Television for Children around the World

Dafna Lemish

ABSTRACT

This chapter analyzes the goals of producing quality television programs for children around the world as they pertain to issues of culture and gender in a world of profit-driven globalized market. It is based on interviews, conducted between 2004 and 2008, with 135 producers from 65 countries. The main themes highlighted are: the tension between the preservation of local cultural identities by television programs and the highly successful Western programs disseminated by globalized networks (such as Nickelodeon, Disney, Cartoon Network); and the crafting of strong, complex, and diverse characters to serve as role models for children and to provide them with a vision for an improved self and a better future. Television, according to the study, is expected to be a safe and relevant space for children.

There are few critical studies of the production domains of television for children. Several scholars who have undertaken comprehensive analyses of the children’s television industry in the US and UK explored various economic, organizational, commercial, and content-related topics (Alexander & Owers, 2007; Banet-Weiser, 2004; Bryant, 2007; Bryant & Monge, 2008; Buckingham, Davies, Jones, & Kelley, 1999; Hendershot, 2004; Pecora, 1998). These studies unveiled some of the mechanisms in operation in this professional world and demonstrated, for example, how economic

pressures enforced institutional decision-making processes that incessantly drive for higher ratings in a profit-driven market.

These studies have also been helpful in documenting the fact that the community of children's television production and broadcasting shares one assumption that seems to be applied in axiomatic fashion, and therefore serves as a non-debatable truism: although girls will watch boys' shows, boys will not watch girls' shows. Direct evidence of this shared belief comes more specifically from the few studies that actually talked to professionals themselves (e.g., Seiter & Mayer, 2004). The implications of this truism are profound, as it provides a rationale – both economic and “moral” – and a general argumentation for the production of more programming aimed at boys' interests and needs, under the umbrella of serving children's tastes and pleasures.

However, overall, we still know very little about what media professionals assume and expect of their child audience, and what role they assign themselves in the production processes (Buckingham, 2008). In a rare example of one such study (Buckingham et al., 1999), the researchers identified four broad discourses about child audience in their interviews with professionals in the UK. The first, a protectionist discourse, perceives the child to be vulnerable to the negative effects of the media and therefore in need of protection. The second discourse is child-centered and dwells on the child's essential nature and unique stages of development, which form the rationale of specific industry practices. The third understands the child to be a consumer of services and goods provided by the industry. And the fourth discourse frames the child as a social actor who is perceived to be a citizen in the making. The authors' discussion focused on the implications of these different discourses of childhood for the practices employed by broadcasters of children's television and for the yet to be realized potential of a research agenda that will probe these findings and discover others.

Though little is known about producers' perspectives on their work, the fundamental reality is that these are the professionals whose thinking and actions create the story lines and representations of social worlds that travel globally on children's screens. The vast literature on the roles screen culture plays in children's lives suggests that it has significant implications for their development and well-being in all aspects of human life: cognitively, socially, emotionally, behaviorally, and even physically and sexually (Calvert & Wilson, 2008; Lemish, 2007; Mazzarella, 2007; Pecora, Murray, & Wartella, 2007; Strasburger, Wilson, & Jordan, 2008). Critical reviews of television programs popular among children suggest that much of what children are watching around the world does not necessarily have their best interest in mind. Indeed, much is violent and imbalanced in terms of gender and human diversity (class, religion, ethnicity, race, disability). Furthermore, it is highly commercialized, hypersexualized, and quite often just plain uninspiring. Yet alternative programming for children does exist on television that is sensitive to their needs and well-being. In my experience, these quality productions are produced for the most part in educational public as well as in small specialist for-profit and not-for-profit organizations around the world, and occasionally by some of the big commercial corporations (Lemish, 2007).

A much debated issue, both in the professional and in the scholarly world, is that of the meanings ascribed to “quality” television. These meanings are embedded in larger concerns about the role of power hierarchies in television for children – concerns such as: Who defines what quality is, and on whose behalf? What are the criteria for judging quality? Who determines them? And do they shift across cultures as well as over time? Is quality judged differently for different audiences? Have new television genres and aesthetics, as well as innovations in television production techniques, created a need to adjust definitions of what quality means?

Overall, we can say that the criteria of quality employed are colored by value judgments, personal tastes, and emotional responses to television content (McCabe & Akass, 2007). Yet there is a broadly shared view that can be summarized as follows. Quality children’s television needs to provide children with programs prepared especially for them without taking advantage of them; programs that entertain, but at the same time try to advance child viewers – physically, cognitively, emotionally, and socially. Furthermore, such programs allow children to hear, see, and express themselves, as well as their culture, language, and life experiences, in ways that affirm their personal identity, community, and place. Doing so requires taking steps to protect and encourage programs that reflect local cultures and cultures with minority languages. At the same time good quality programs for children recognize, and seek to be inclusive of, the significant differences that exist among children, which are the result of their cognitive and emotional development, talents, interests, personality characteristics, interpersonal relationships, and social environment. Finally, such programs are expected to offer children a variety of genres and content that do not necessarily reproduce programs according to a successful formula and that avoid unnecessary presentations of violence, sex, and other contents deemed age-inappropriate (Lemish, 2007, pp. 200–201).

Who, then, are the people engaged in advancing alternative productions for children that can be defined as “quality” television, according to these general domains of agreement about criteria for determining quality television? What do they bring with them to their workplace? How do they perceive their profession, their responsibilities, and their limitations? And, most of all, what roles would they like television to play in fostering children’s well-being? The social action research adventure that I advanced sought to answer these questions.¹

The Study

Over the course of four years – between 2004 and 2008 – I interviewed 135 media professionals from 65 countries in all continents, whom I met at various international events for children’s media, including the most central ones: Prix Jeunesse International festivals of 2004, 2006, and 2008 in Munich, Germany; the Japan Prize of 2006 in Tokyo, Japan; the Basel–Karlsruhe Forum of 2007 in Basel, Switzerland; and the 5th World

Summit on Media for Children in 2007 in Johannesburg, South Africa.² These events are designed to allow professionals to exhibit, exchange and network with, and learn from other professionals concerned with quality productions for children.

Collaboration with the interviewees spanned from enthusiasm and desire to converse and willingness to share ideas and dilemmas through to rare occasions of outright antagonism (although these few incidents do not seem to have anything in common). Most expressions of reluctance to be interviewed were related to a concern about inadequate English linguistic skills and an overburdened schedule during the events. What was clearly helpful for my project was the atmosphere and the expectations of conduct in these international events: professionals who attend them come with a predisposition to interact, network, meet new people, talk about their work, and demonstrate tolerance and interest in the work of others. So, being approached by a total stranger who presented them with a request to meet was a completely normal and accepted situation. Therefore, on the whole, interviewees were agreeable and in the majority of the cases seemed delighted to have an opportunity to talk about themselves and their own work, as well as to express their views on the work of others to which they have been exposed during the event or outside it.

Interviews included questions about the producers' own personal career development; their current work; their perceptions of social issues in their culture and in television for children in their country; their impressions of social representations in their own work and in that of others, which they had viewed in the festivals and elsewhere; their suggestions and aspirations for change – and the like. While I embarked on this study with a specific interest in changing gender representations in children's television around the world, the interviews developed in quite unexpected ways, to encompass a host of issues of concern in television production (such as cultural diversity, the workplace, budgeting, and policy).

Each of the 135 interviews was unique, and, collectively, they created a wide range and diversity of responses. Interviewees employed various types of response techniques that included the use of diversion, confrontation, and avoidance strategies, as well as advancing personal agendas. Overall, it is impossible to summarize their nature in a unified manner, except to say that they required a great deal of flexibility on my part. Almost all interviews were tape-recorded and transcribed verbatim, and – since most interviewees were not native English speakers – they were also lightly edited for English, but with the attempt to preserve the style and flavor of the original conversation. The transcripts were later submitted to a grounded thematic analysis of the main issues that surfaced in the interviews.

The presentation of this project here, in a very selective and brief form, mobilizes the expertise of professional producers of quality television, allows their voices to be heard, and in doing so enables them to contribute to debates within the community concerning critical approaches to media studies. I make use of selected quotations to enable the producers to speak for themselves rather than I, the privileged researcher, attempting to represent their views in my own voice. Thus the project that evolved now also illuminates the potential benefits of integrating professional and academic

ways of knowing about the media and social world. When quoting or referring to interviewees, I use pseudonyms reflecting their specific gender and culture, as well as their other individual characteristics. The following discussion focuses on two main themes: who the producers of quality television for children are; and what quality television means to them.

Who Are the Producers of Quality Television for Children?

Collectively, producers of quality television for children represented a diversity of cultures, religions, races, historical backgrounds, political regimes, technological advancement, media systems, and a host of other variables that may affect the social realities portrayed on the screens. The predominance of female interviewees (two thirds) is, however, reflective of the professional makeup of the field of media production for children (suggested also by others, see for example Banet-Weiser, 2004). Indeed, many interviewees commented that female professionals dominate the specialty of children and youth as well as educational television within the world of television production; as Augustine (Portugal) put it, “it’s a woman’s world.” The observation about the feminization of this area is consistent with, and reflects, the traditional segregation of occupations, which perceived the area of children and television to be an extension of women’s specialization in the private sphere. Such, for example, was the explanation offered by Hanne (Norway): “Women choose caring jobs and children’s television is more caring than economics, news, or sports. So you can see the same pattern: most of the people involved in children’s television are women.” A similar argument was put forward by Eric (Canada): “I think it is a way to balance the fact that there are so many men working in media and other fields, and women are caring, and they are good in nurturing children [. . .].” The above two quotes suggest the argument that, first, the definition of femininity includes a capacity for caring, apparently perceived to be lacking in masculinity; and that, second, children’s television is an extension of the private sphere of childrearing and nurturing, as is evident in many professions dominated by women (e.g., education, nursing, social work). Many other interviewees supplied evidence of having internalized this position as well. This was particularly evident among female Asian interviewees (from Pakistan, Malaysia, Nepal, Iran), who explained how children’s television was perceived to be a legitimate professional area of employment for women in societies where women’s presence in the workforce was not necessarily always deemed to be acceptable.

Another explanation offered for the dominant presence of women in this domain relates to the political economy of media employment. Hope (US), for example, provided a structural argument in addition to the nurturing one: “[It] started coming about 25 years ago, when it was a fairly young industry, so women who came in at

the bottom, as I did, as somebody's secretary, were able to move up in the rank." This explanation too, is not unique to the television industry: women find it much easier to move up the ladder in young organizations with a yet to be established tradition of male domination.

That the feminization of media professions is associated with lower status and income, as well as with a lower frequency of long-term contracts, has been documented in many studies (as in the case of the feminization of other professions – education, secretarial work, or family medicine), and its discussion is not within the scope of the present chapter. Yet evidence of this significant phenomenon leads to more general political economy concerns related to the interlocking relations of gender and money (Meehan & Riordan, 2002), including their impact on the field of television for children more generally (e.g., global phenomena of limited governmental support and low budgets for educational children's programming), as well as to the material conditions of women working in this domain of media practice.

Furthermore, there is additional employment segregation along some marked lines within the specialty – and the world – of children's TV. Interviewees agreed that, while women occupy most of the roles of producers, developers of content, and consultants, they remain a minority among those who actually convert these ideas into television programs – that is, among the technological and production professions: directors, camera and sound professionals, or program directors. While organizational and content-oriented roles are more "women-friendly" and are deemed to be more in line with feminine traits and skills, the technical ones have been historically male dominated, and thus more difficult for women to infiltrate and flourish in. Most notably, argued many interviewees, the world of animation, which dominates the industry and perpetuates many of the problematic stereotypes, remains mostly a male world, as very few animation artists are women. Indeed the US animation guild reports a 10% membership of women (Geena Davis Institute, 2007).

In addition to the various aspects of horizontal segregation, many interviewees brought up issues related to vertical segregation – that is, the hierarchal authority structure within each workplace. Despite the fact that children's TV is a "woman's world," in many places this world is still managed by males at the executive levels of decision-making. While this situation was changing dramatically, according to North American and European interviewees it remained particularly true in many other countries in the rest of the world.

The discussion of the gendered aspects of employment in children's TV brings us back to the point of focus of this study: the influence that this situation may have on the content produced in such an environment. Clearly, television production is not an individual creative activity, but it is part of a contextualized cultural process, situated in a particular institutional setting. However, a specific reference to the personae involved in the "moment" of production "in which cultural objects or texts are brought into being" (Buckingham, 2008, p. 222) deserves our attention. This line of thinking leads us to a series of questions, such as: Do women produce different

types of programs from men? Do they prioritize different issues? Do they bring to the screen different perspectives? Do they choose more female characters? Do they develop different narratives? Similar questions have been debated, for example, in the area of news journalism: Do women journalists define news' values in a manner different from men? Do they advance a different social agenda? Use a different language and style? Interview more women and present them in a less stereotypic manner? (see Byerly & Ross, 2006).

Overall, it is interesting to note that few interviewees evidenced any awareness that the gender of persons involved in the TV world makes a difference to the kind of television content produced for children. However, as many of my interviewees suggested in one way or another, it is the survival impulse of making money that is much stronger among female industry leaders than their feminist conscience, and therefore women in positions of power do not necessarily behave differently from their male colleagues in similar decision-making positions or make different choices from the ones they do. As noted above, this argument has been made in relation to other realms of media production, and it suggests that the mere gender of the professional is no guarantee of particular social sensitivities, nor does it provide sufficient motivation to struggle against institutional barriers and to take personal career risks.

Perceiving Television for Children as a Safe and Relevant Space

The overriding theme that emerged from the interviews with regard to producers' perceptions of the role of quality television for children was the desire to present to them a world that is safe, yet relevant to their real life experiences. "Safety" was framed by several of the interviewees in general terms, as a symbolic space where "parents can turn the TV on for their child and not worry that something will suddenly be on it that is disturbing or inappropriate," as Diklah (Israel) stated. Disturbing and inappropriate are usually terms referring to violent and sexual representations, the two "red flags" often cited by politicians, policymakers, and advocate groups. However, in the context of this study, those concerns were taken for granted, as the interviewees moved beyond them, to much more nuanced concerns regarding the social world presented on television. As Mike (US) expressed passionately:

Television can be forward-thinking, it can show people different ways of living and accepting. I don't want to reflect reality the way it is, but reflect reality the way I think it should be [. . .] as we grow up we forget about love. We get busy, we get smart, we become greedy – all these things happen to us [. . .] I don't mind modeling a utopian world, I would rather have people who say I have learned something from that show, that's what I want to do, I want to make a positive change, even small, rather than validate the problems.

Similarly, Abby (US) said:

I think that we as program-makers have a responsibility to those children, and we have to show them the good things in life. And the good things in life are not merchandising and they're not television-to-sell things, they're embracing interesting characters, they're showing love, they're showing strength in individuals, morality [. . .].

It is interesting to note that both of these quotes surmise that a better world is one not so dominated by money, which was a central underlying theme of the study.

In sharing their visions of a safe and relevant television world, producers framed their ideas within two general meta-themes along the lines of designing a program concept: the nature of characters on children's television, and the characteristics of the context in which the storylines are developed. Interestingly enough, the narratives themselves received little attention in the interviews, as they seemed to be perceived as driven by the creative process of designing strong characters and of placing them in a socially desirable environment. We turn now to the discussion of these two meta-themes.

Strong, Complex, and Diverse Characters

A prerequisite for quality television for children was the presentation of both boys and girls on television as "strong" characters, as suggested by Maggie (Ireland): "A strong character is someone that takes the lead in action, who suggests solutions to problems." When probed for more details, interviewees suggested that a strong character is, for example, energetic, intelligent, active, trustworthy, cooperative, someone who works toward a goal, overcomes difficulties and deals wisely with conflict. Such characters are supported by good friends and by caring adults. Interviewees referred to an ethical dimension of personality: the character would have to be someone who is respectful and caring of others, and who is concerned about values that go beyond one's own gains and self-centered satisfaction. Brad (US):

I think you would like to show that good character matters, that morality can be a successful formula for your life, that it's not only the nasty, thin, rich, obnoxious people who are successful. So for both boys and girls I think they need to see a way through to being good human beings as well as successful people.

A theme repeated by several interviewees addressed the need of both boys and girls to see children overcoming difficulties and becoming stronger and better as a result of the challenge, along with stories of girls and boys who are survivors, not victims. Beatriz (Ecuador) wanted to present a character that "knows very well where she wants to go, what she decides, but [is] also able to show weaknesses, and how to deal with them [. . .] to show the process [of] how one can deal with weakness and convert

disabilities into abilities.” Eric (Canada) shifted this thrust when he suggested that boys and girls need programs about finding one’s mission in life:

It’s not about role models; it’s about becoming who you are. We have a wide variety of characters in our society and we need all these people with different skills. So, it is not about trying to convince them to become something else. Of course there are some role models, like I use athletes a lot [. . .] but the kids will have to discover who he or she is, so I don’t want to portray a certain type of person they should be like, this is not my vision.

Kate (US), too, believed that engaging characters are what makes the difference in children’s television:

I think that it’s nice when you have characters that are heroic, you know, whether they are boys or girls. Where there are opportunities for the kids to see courage and be in a difficult situation and use an ability to reason to get out of it [. . .]. That’s probably not where the rest of the business is going, because a lot of movies are about a lot of special effects and they don’t care much about characters. But to stand the test of time, I think you have to have characters that kids relate to and connect with.

Strong characters on children’s TV are also complex characters, according to these professional experts. The need for character complexity was one of the central arguments raised by interviewees, given their widespread critique of the general presence of underdeveloped characters and, more specifically, of gender stereotyping. Their arguments claimed that unidimensional characters built upon one specific trait (e.g., being the “bitch-blonde” or “goody-book reader” girl, or being the “bully” or “geek” boy) lend themselves to simplification, stereotyping, and underdeveloped plots. While this is quite an accepted rule in scriptwriting (Cowgill, 1999; Dancyger & Rush, 2007), interviewees insisted that it is essential in efforts that seek to break stereotypes, since underdeveloped characters almost always fall into the trap of reducing the type of person they portray to specific traits, for instance gendered ones, along traditional binaries such as active/passive, rational/emotional, leader/follower, ugly/sexy, intellectual/fun-loving, manipulative/victimized, and so on (Lemish, 2008). Here is Mike’s (US) view:

Stereotypes are due to a lack in creativity. When someone is very creative, they are not going to create stereotypes, since stereotypes are a product of bad writing. If you create well rounded, complicated characters, they won’t be stereotyped. Having interesting characters means oftentimes going against types to keep them fresh and interesting.

Julie (UK) provided a more detailed explanation in advocating for complexity:

I think the more complex we can make our characters, the more sides of them that we can show, whether they are boys or girls, the richer the characters are [. . .]. Complexity

of characters is what everybody should strive for [. . .] what's really important is: Do we believe these characters? Do we understand them in that context? Do we think they feel what they feel and behave how they behave?

Part of the effort to provide children with a “safe space” of television via the choices made in the presentation of characters was a desire to present a society of inclusion. Elaine (Brazil), for example, suggested: “When we talk about inclusion we are talking about the blacks, and the poor, the disabled, the Indians [. . .].” Similarly, Svein (Norway) described diversity issues related to recent immigration waves from around the world, a concern expressed by many north European interviewees:

We try to raise the status of children coming from other countries [. . .] as there are a lot of immigrant children [. . .] We have to reflect that in all of our programs [. . .] We have to show children from Turkey and Pakistan, and also from Asia – Korea, Vietnam. A lot of the children have been born here and they are mixed in the Norwegian society more than their parents, and that's where some of the conflicts are. And we have to deal with it on television.

The interviewees' discussion of diversity calls for attention to be directed to the intersections between all central human circumstances and characteristics that interact to construct identities: gender, race, ethnicity, class, religion, language, geography, history, abilities, age, sexuality, family. Diversity is required everywhere, in all the forms and types of characters in fiction and non-fiction formats, both frontstage and backstage: different bodily and facial shapes and skin colors, costuming and apparel of all cultural styles and fashions, languages and accents, home interiors and foods, customs and religious traditions. This diversity should reflect the urban and the rural ways of life, as well as the various classes that constitute and are representative of children's worlds. Good characters and exciting stories can appear in all colors, shapes, and forms.

Overall, participants' framing of diversity assumed a general liberal position, most often referred to as multiculturalism and tolerance for difference, expressed by means of representations that are consistent with the changing configurations of societies and with the challenges involved in shifting away from the hegemonic whiteness on television. Interestingly, while racial hybridity seems to be a growing feature of commercial children's television and related merchandising (with popular images such as the Bratz Girls, Lizzie McGuire, or the Cheetah Girls), interviewees did not address it directly or give it as an example of representations to be included in children's programming. Hybridity and racial ambiguity can be interpreted as producers' acknowledgment of the lack of racial purity, yet at the same time it seems to work as a successful marketing strategy, which attracts diverse audiences through a limited number of characters that seem to speak to all of them. One ambiguous “Brown” character can appeal to a wide range of ethnicities – including Latin, Middle Eastern, Asian, and Native American – without alienating public of Caucasian descent (Valdivia 2008; 2009). With trends of colorism (the whitening of people of color), even some

Black populations can relate to the character “Brown” as one of their own. This may help, for example, to explain the global success of the Nickelodeon pre-school hit *Dora the Explorer* (2000–); the ease with which Japanese animation featuring racially ambiguous characters travels; or the popularity of *High School Musical* (2006), whose lead female character is a Latina. For some interviewees, hybrid characters represent a true vision of a world of racial equality, one in which people create life together on the basis of who they are and of the nature of their relationship, rather than on the basis of their biological and cultural heritages. However, for others, hybridity represents a form of “dissolving” or “erasing” race instead of marking and celebrating it, and therefore a true danger to the preservation of heritage and a threat to the most basic beliefs that constitute people’s identities.

These concerns build upon a feminist reaction to the historical failures of a variety of media, including children’s programming, to incorporate the diversity of marginalized voices: of young people, of non-heterosexuals, of the disabled, of people of color, and of people from lower classes of society. It is worth noting, however, that sensitivity to diversity issues has come to be understood not only as a moral and political issue, but also as a requirement for a central cognitive skill that is crucial for survival in the global world. The need to cultivate a “respectful mind,” as Gardner (2008) defines it – responding systematically and constructively to differences among individuals and among groups, seeking to understand and work with those who are different – extends beyond mere tolerance and political correctness, into the realm of flourishing and well-being. Indeed, Todd (US) described a program he was producing along these lines:

We have segments produced in Israel, Egypt, Palestine, Jordan, South Africa, Russia, Holland. And all of these are segments about a child in another culture mastering something difficult in their culture. They may have nothing to do with our culture, but it’s the common sense of mastering and of struggle, of what is similar and different to the child in the audience [. . .] so a child in Mongolia, a little girl who learns to balance balls on her head, is appealing to a young boy or a young girl here who is saying “I don’t do that but I respect and understand the challenge of her learning how to do it, just as I respect the little girl in Holland who has to learn how to ride a bicycle because everybody rides a bicycle there to get from one place to another.” It’s the idea of struggle and it’s a universal concept but it has its own particular attitude and angle [. . .].

As Todd explained, highlighting commonalities in spite of their cultural manifestations is perceived as a means to advance tolerance and cultural understanding.

Finally, related to the notion of presenting strong, complex, and diverse characters was the suggestion to present, in children’s programming, the perspectives of children themselves, as they are viewed and expressed by them. The notion of empowering underrepresented and misrepresented groups by giving them a voice in the media has been discussed extensively by scholars with diverse interests and coming from a variety of theoretical approaches (Couldry, 2008). Children, in particular, lack space, a voice, and hence agency – both in the theorizing of childhood and in its

representation, in all cultural and media forms. The extremely limited presentation of children's voices in research has led some scholars to question our ability to make sense of their media experiences and of what can be concluded about their inner worlds. One form of "giving voice" is the development of children- and youth-made media – for example independent blogging, the posting of photos and art-work, and the production of home videos and biographical documentaries; guided school projects; aided productions in training workshops and specialty classes; or involvement in social movements and activism through the use of media and through the production of messages. The value of these activities in the development of literacy skills, civic engagement, and personal growth has been widely discussed (see Chalfen, 2008; Kearney, 2006). However, in the context of our discussion, "giving voice" has quite a different (albeit related) meaning, as it refers essentially to enabling children's perspectives to be expressed in adult-produced media. For the most part, this is rationalized by producers in terms of the importance of the programs becoming relevant to children's lives and in terms of producing better "value" and higher quality programming for children audiences. These interviewees felt that creators of children's programs often talk about children rather than letting children talk for themselves. This was also expressed in the form of a distinction between programs *about* children and programs *for* children. This distinction suggests that a program featuring children does not necessarily have children's well-being and needs as its goal.

Several examples illustrate this argument: Emma (Bolivia) said: "We made a series with the title *With Our Own Voices* where children talk about their lives, about their rights. They can speak, they can talk with their point of view; and I think it's very important that they do so in their language [. . .]." Margaret (Kenya) shared: "We were watching a program from Asia about a girl who wants to go to school and it is very interesting because it was a story from a girl's point of view [. . .] so the issues are still the same but from a different point of view." And Mpule (Botswana) recommended: "I give them all voices so that they share how they feel, they share their success stories, their fears, their disappointments together. Let them have a face." Thus it became clear that casting children as program characters may be a necessary, but is certainly not a sufficient, condition for a program to be considered a quality program for children.

In summary, then, according to my interviewees, a diversified screen provides more realistic and humane portrayals of current societies around the world, and is also central to the well-being of the children growing within them. It celebrates girls and boys as children who share the same challenges, aspirations, morality, dreams, and hopes; children who need love and friendships, have adventures and overcome difficulties; children who are curious and eager to explore their surroundings, and who struggle with their multiple identities; children who try to carve their place in the world. Children's television, the interviewees advocated, needs to present children who are self-willed, positive, share their problems and accomplishments. Good programming, so the interviewees told me, brings children closer to each other and

at the same time closer to themselves. With so much in common, sticking to gender and racial stereotypes “is just plain lazy,” they often said, while developing fun and smart characters who are true to themselves but also do unexpected things is difficult and creative. As many of the conversations unfolded, it became clear that breaking stereotypes and opening up the screen to the possibility of blurring gender and racial differences and of offering children a real choice that cuts across divides is seen by interviewees as a way to foster a safer and healthier environment for children’s growth and development.

Between the Local and the Global/ US

In addition to offering children strong, complex, and diverse characters with their own voice, interviewees believe that television has a responsibility to offer children visions of a socially desirable context in which such characters take action. Concern for social context spreads on a wide spectrum, from family arrangements on the one hand to a global world order on the other. The presentation of children growing up while they are supported and cared for by responsible and loving adults is claimed by many to be one of the major contributions that television can make to assist children. These may be street children in huge urban centers whose life circumstances left them to fend for themselves, or “latchkey” children of affluent families – of parents caught in the pressures of a competitive capitalist world who pamper their children with leisure technologies and accessories as replacements for a real and meaningful presence in their lives. Given this emphasis on change, I should also note that none of the interviewees spoke in favor of restoring a traditional family structure with a clear distinction between the private and the public sphere, with a stay-home mom and a wage-winning dad. Neither did they specifically address children as the purpose and goal of family life – a central notion associated with capitalism (Kapur, 2004). Instead they expressed a wish to recapture the view of families as responsible for the well-being of children, and particularly a view of adults as significant caregivers and upholders of culture and tradition.

Indeed, for many of the interviewees, particularly those from non-Western countries, television for children was expected to serve nation-building roles and to encourage children, first and foremost, to love and take pride in their own culture even as they learn tolerance to others. As Sumita (Bangladesh) put it: “Good television for children means that you teach them that they should love their country, they should love their culture, and also they should gain knowledge of other cultures.” This theme was strongly entangled with a discussion about the Americanization of children’s television around the world. Producers were cognizant of the unique “feel” of their local productions, as they were constantly comparing their work to that of others in their profession – especially those in the “imagined production center” of what they referred to as the Westernized television screen. This social practice of “imagination,” to apply Appadurai’s (1990) conceptualization, refers to the

construction of collective aspirations for some global sense of place. The interviewees, however, tried to dissociate themselves from such a collective imagination, as they were wishing for their own local voice to be on the screens that children were watching.

Thus the much debated tension between “local” and “global” and the perceived consequences of cultural globalization, as well as the differing conceptual varieties of Americanization and Westernization (Featherstone, 1990; Feguson, 1992; Tomlinson, 1999), were salient in the interviewees’ reflections on their own work. Unsurprisingly, “global,” as used by the interviewees, rarely meant “universal.” Indeed globalization seemed to refer to the spread of products and images mediated by the West (Sreberny-Mohammadi, 1991), from which none of the countries involved in this study was immune. Thus the notion of “the West and the Rest” came out very clearly in their discourse, together with a form of cultural particularism through which producers attempted to assert their own unique identities. The claim that we live in a world increasingly characterized by Americanization has been put forth repeatedly by these interviewees, reflecting much of the intellectual and political thought on these issues. Objections to the erosive power of globalization on local cultures have frequently featured among the fears of Americanization: the influence of the US and, more specifically, of its values, ideology, economics, political interests, and culture. As in other realms of discussion, the critique expressed “from the ground up” by the producers here is strongly entangled with admiration for things North American, as well as with a desire to perform at a similar professional level.

This cultural “feel” was frequently framed within the local–global tension, highlighting a clear “we” versus “they” binary. Mapule (Botswana) expressed it quite bluntly when she said:

We, as a developing country, we train in the West [. . .] We do what the West is doing. They’re sort of being the leader, and we are being the followers. It is only now that we are trying to find out our own voices within the global village. To say what is really our need as a country, as Botswana; what are our cultural values [. . .].

Mapule recognized the dependency of her society on the resources and training offered by the developed West, but she suggested that this comes at a price – the price paid to the cultural authenticity of the images on the screen.

Interestingly, the “we” versus “they” was not unique to non-Western societies alone, as many of the interviewees from European countries – as well as from Australia and Canada – defined themselves as “we” in contrast with a specific US “they.” For them, globalization trends are clearly synonymous with American imperialism, as they do not perceive themselves to be part of the Westernizing cultural trend. While it is impossible to measure the intensity of responses in this type of study, my reading of the interviews suggests that the interviewees from Western non-American countries were as concerned and critical of US television as the non-Western producers were. Sarah’s (Australia) argument is paradigmatic of such views:

We get so much American TV . . . I don't think we get a balance, our kids are watching mostly American shows and a lot less Australian ones . . . like the whole American high school scene is so completely different in America . . . I think the peer thing is different, the whole structure of high school, you know, junior high etc., we don't have it . . . the lifestyle is similar but different, the accent . . . slang . . . [. . .]. There are programs with the Black American family that have no relevance to Australian[s] at all . . . it doesn't mean our kids don't enjoy them, the comedy or whatever, but it certainly does not look like their own homes or their families, the way they speak, there is a difference . . . they are not reflecting our culture but somebody else's. And, since most of adult television is American, they [children] will get that soon enough – so we [producers of television for children] try to keep a bit of Australian culture.

Comparing one's television programs to the dominant US ones was a common discursive strategy adopted spontaneously by many of the interviewees, regardless of the topic under discussion. Kasper (Denmark), for example, compared his culture to the US screen:

Yes, definitely American programs look differently. I don't think the American ones are bad. I used to have this feeling that this is not real, that no Danish school kids have a convertible car to drive to school in, and none of the school kids live in a house together with other school kids. So, I was thinking what was this doing to our kids, and how could they identify [. . .]. And *Friends*, which is a very big serial, has a lot of morals in it, and a lot of issues that the children learn. But, I can never do one like that, first, because I don't have the budget, and second, because it doesn't really look the same when it is not in America. So whenever we do something we will go the other way, we step back and make real drama or real series about our own life, true identity.

The longing for more visibility of their own culture, as expressed above, was shared by many of the producers and was interwoven with a deep concern for issues related to the political economy of local production, as Leona (Philippines) explained:

In the context of media landscape, where you have dominantly imported programs 70–30 [*sic*] percent, it becomes imperative to develop something that is indigenous, that is theirs [our children's]; that speaks in their language and deals with topics that are about their lives, not only as young children growing up in a particular stage in their lives, but as Filipino children.

Valentina (Chile) recounted in her own voice what she understood children to be saying, on the basis of their participation in a workshop conducted by her station:

Children said, "I want to see me there! I want to see a Chilean boy there. I want to see my culture there. I don't want to look like a boy in Manhattan, because this is not my life, this is not my style of living, I don't feel me if I watch a guy on motorcycle. That's not my reality."

Some producers took this desire for cultural visibility a step forward and translated it into their actual work. Suzanna (Kenya), for example, was more proactive about the ways in which they attempted to highlight cultural uniqueness:

The whole thing about this animation project is that we are not drawing from an obscure content base. We are going for African stories, myths, heroes [. . .], creating a cultural grounding in the first place. We need to pay attention to our culture, our language, our needs . . . We have, for example, a big problem with female mutilation. Some issues are not necessarily addressed by the programs that are imported . . . We have issues that are very particular for Kenya and we would like to have programs that address them. We think our children will relate more to the stuff that they see everyday rather than things like *Powerpuff Girls*. They are good because they say that girls are heroes but at the end of the day you want to bring up a citizenry that knows their country, these are our leaders of tomorrow.

Interestingly, Suzanna, like many of her fellow interviewees, is not blind to the potentially valuable contributions that some US television for children is providing, as her example of the *Powerpuff Girls* (1998–2005) implies. Again, like most other participants in this study, she is also quite familiar with the “big hits” traveling around the world and attracting children all over. Nevertheless she positions the specific needs of raising the “leaders of tomorrow” in her and their Kenyan culture in clear opposition to what US productions can offer them.

Indeed, on occasion, discussions of discrepancies between the local and the North American were perceived as cultural clashes and took a clear form of critique. Direct blame was directed at US television and its role in perpetuating inappropriate values (e.g., consumerism; a Caucasian unattainable “beauty myth”; middle-class lifestyle; hypersexualization of culture). Interviewees even critiqued approaches employed by US producers, claiming that they flooded the children’s television market with stereotypical representations of the supposed American way of life and its associated gender roles and racial stereotypes.

Thus US programming was criticized at many levels: for being stereotypical of gender and race; for perpetuating a particular, unattainable beauty model for girls; for being irrelevant to indigenous cultures; for being too limited in the scope of its content and in issues for children as they mature; for unnecessarily accelerating adulthood. True, these critiques echo many of the themes that dominate the discourse in the literature about cultural imperialism. Yet these are not views of academics, but rather statements made by practitioners, people who populate the production professions in the television industry around the world, most of whom are far removed from the heated intellectual debate flowing through academic journals and argued over in conference halls. That is, these are the views of hands-on television producers, who watch a lot of television for children from around the world and who struggle to create their own.

Some of the North American interviewees dismissed the notion of “American values,” claiming that the US culture itself is heterogeneous, and they disregarded

the conflation of economical interests with cultural influence. A few of them referred specifically to 9/11 as a sea-change date that made them think differently about their role as television producers, as Todd (US) explained: "I think one of the things we say [is that] we have to teach children not only to respect the differences but, after 9/11, how to stand up to intolerance, and so that's part of what we are trying to do in our shows." Abby (US) also reflected on the particular global circumstances in which US children are raised today and on what she would like to see television provide children:

I'd like children to feel comfortable in their world. [. . .] There are so many fears in children's lives now, all over the world, that television has a responsibility to children to try and make them feel safe and to feel good about themselves, and good about their world. Now their world might be their backyard, but also to understand different cultures and to embrace other cultures [. . .] The key for me to children's television is to make children feel safe and protected and excited about the world and I think that children are terrified of the world, terrified of traveling, and I know younger children who don't want to go anywhere, they want to stay at home. And I think that that makes very insular adults and I think that television has to expand the mind but it also has to give children courage.

Children, so the argument goes, are facing similar global issues of personal safety, anxiety over the future of the world and their place in it. Television has a responsibility toward all the children to help them become courageous citizens of this world.

North American professionals also brought up the fact that they adopt (and adapt) programs produced elsewhere; the unprecedented success of the Japanese animation series *Pokémon* is a case in point. This is an example of the "the Megaphone Effect," according to which "true acceptance of a cultural product seems to come from crossing the Atlantic and becoming a success in the United States [following which] items seem to acquire an ever-expanding sphere of appeal extending across the globe" (Bloch & Lemish, 2003, p. 159). *Pokémon* began in 1996 as a video game used in Nintendo's Gameboy; it became a popular TV series, a card game, a movie, and then the subject of massive merchandising. From Japan it traveled to the US and from there to the rest of the world, becoming an instant hit, dubbed "*Pokémonia*" in the late 1990s. The international commercial success of *Pokémon* was based on the effective use of localizing. This included the omission of five episodes, deemed unacceptable to US child audiences on account of the overly sexual objectification of the female character; changing the names of characters so that they would have a more appealing sound to the US ear; and changing color schemes (see Tobin 2004).

Direct reference to such forms of localizing was provided, for example, by Dana (Israel), who, in her discussion of purchasing Japanese animation, explained:

All of these series go through American adaptation, as there is a need to censor them here and there [. . .] It is a completely different world of concepts and values [. . .] different taboos [. . .] For example, they had secondary narratives relating to homo-lesbian

themes, or open sexual themes. There was once a scene with a grandfather type who pinched a young woman's ass, which I thought was very serious, more so than a battle scene. So we buy them from the Americans and not directly from Japan, because we are closer in culture to the American culture.

Dana's explanation serves well to illustrate how US plays the role of a cultural megaphone for products whose origins lie elsewhere.

Such adaptation efforts are immediately relevant to the desire for authenticity, which came across strongly in the interviews, as a call for television programs for children to be constructed with depictions of true-to-life characters, narratives, and social contexts. There seemed to be broad agreement among this global collection of interviewees that most popular commercial television texts designed for children (as well as for adults) promote behaviors and attitudes that are inauthentic in relation to viewers' own inner selves and desires, while camouflaging the structural mechanisms in operation behind them.

Children's TV and Social Change

Overall, then, the interviewees' discourse, presented here in a very selective, condensed, and brief form is about processes of change – those that are taking place and those that need to occur – in the global television industry's productions oriented to young audiences. Through citations from the interviews I conducted, we come to learn about the producers' ideologies and these ideologies' extension into production practices, the producers' experimentations with a safer social world, relevantly negotiated by the media, as well as the interviewees' alignment with the discourse of social responsibilities and how they advance their visions for social change. As a presentation of itself, this action research project mobilized the expertise of professional producers of quality television, allowed their voices to be heard, and in doing so enabled them to contribute to debates within the community of critical approaches to media studies.

The trend to deliberately incorporate a variety of social issues – health, literacy, risk behavior, conflict resolution, racial tolerance, and so on – in the programming of all the genres of entertainment viewed regularly by children and youth (including soap operas and telenovelas, cartoons, drama, talk shows, quiz shows, and reality TV genres) is particularly evident in the non-Westernized world. This approach draws from the study of “edutainment” genres – that is, an integration of education with entertainment (Singhal & Rogers, 1999) – which have been constructed and employed around the world to advance social change. It recruits popular television texts to advance awareness of social issues, with the ultimate goal of contributing to the empowerment of young viewers by offering them not only information and knowledge, but also role models, reasons, values, and the motivation to be involved in

shaping attitudes and actions that can be incorporated in their own everyday life. The effectiveness of most such efforts has yet to be studied in a systematic, comprehensive manner, although, from what we already know about the relationship between children and media, there is reason to believe that such an approach does have a great potential to contribute to the well-being of children viewers.

However, a critical view of the obstinately conservative status of children's programming in relation to the possibility of change was shared by many interviewees, and even by top executives of major US media corporations. And, interestingly, there seems to be widespread agreement that, since "it is all about money," the most effective arguments for advancing change should not be moralistic ones about social responsibility, but rather arguments that are framed as profit-driven: arguments that demonstrate how money can be made by changing images and by catering to growing demands from the children audience. As one top executive who spoke on promise of anonymity observed: "The best way to promote change is to show there is profit in it." In reflecting later over this proposal, a Latin American executive sighed: "No wonder that television is called, in the US, the 'industry.'" She explained, in response to my request for clarification, that the choice of the term "industry" (over "arts" or "world," for example) reflects the ideological value system behind it: this is a corporate world driven by profit considerations, producing goods on an assembly line, to be sold to mass consumers. Thus "better" programming, for the industry, does not mean "socially better," but rather "more profitable."

In striking contrast, many interviewees – particularly those more gender-sensitive, socially engaged, and involved in advancing change – reflected on the need to develop their own awareness and social consciousness continually, because they admitted to falling regularly into the trap of gender bias, for example – given that all of us have been so strongly acculturated to gender blindness. Interestingly, they employed a model of social epistemology that assigned researchers a very important role: scholars can assist them by conducting action research that will put at their disposal data and observations about attempts to advance programming and about organizational changes related to key social issues. Furthermore, their critical perspective challenges the axioms discussed above and draws a rich agenda for the socially engaged research that is involved in policy and programming changes: Is it true that boys will not watch girls' programs? Will introducing greater diversity expand audience numbers, or will it lead to a decline in them? Do new images of boys and girls, as well as of new relationships and collaborations between them, appeal to various young audiences? How do children react to seeing persons who do not fit the "ideal appearances" of the people on their screens? How are decisions made in organizations that produce and broadcast for children?

Overall, I concluded that most of these interviewees want to be listened to and to learn from relevant research that will help them in their decision-making processes. This finding stands in sharp contrast to another accepted "axiom" employed in both academic and industry circles: one that argues that these two professional worlds are mutually suspicious, disrespectful, and dismissive. Accordingly, so the axiom goes,

professionals believe that academic research functions in an unapproachable and generally out-of-touch “ivory tower,” irrelevant because it is unaware of, or unwilling to account for, the constraints of “the real world.” In turn, academics believe that many professionals are too arrogant and uninformed to listen to solid, substantiated, and evidence-based advice. The findings of this study support a view that is diametrically opposed to both claims: the media professionals who participated in the study call for serious, in-depth, and productive collaboration between these two worlds of expertise.

The professionals’ desire for collaboration with academics is encouraging, given the rise, in academic associations and published scholarship, in current debates about the role of communication scholars as public intellectuals (Garter, Dutta, & Cole, 2009). Indeed, this study can be seen as an example of how engaged scholars of media studies and media professionals can move beyond conventional studies of media representations toward developing our understanding of the ideologically driven mechanisms, political economy constraints, and means of production that drive the images that both academics and many media professionals have been criticizing for so long.

Is Media Work Good Work?

A Case Study of Television Documentary

David Hesmondhalgh and Anna Zoellner

ABSTRACT

This chapter examines a politics of creative media work in order to make claims for what is good work. These claims follow a number of recent critiques of work emerging from media production studies. Drawing on sociology, philosophy, and social theory, the chapter develops a model for the analysis of good and bad work in general. A case study of the independent television sector in the UK and Germany then applies this model to illustrate the coexistence of positive and negative features in media work. This intervention aims to promote the kind of emancipatory social action necessary to make access to good work, including good creative work, more equal and just.

To what extent is the work involved in media production *good work*? What is the quality of working life in the media industries? These are surely vital questions for anyone concerned with media production, and yet they have been neglected amidst the boom in studies of creative or cultural labor in recent years. Many recent critics have rightly pointed to problematic aspects of media labor, and we explore some of these below. But we shouldn't forget that there are real reasons to think of media work as attractive, satisfying and rewarding, at least some of the time.

In one research interview, for example, a camera operator spoke of the pride and satisfaction he gained from work that involved "doing really good camerawork that

really expresses the situation and expresses it really honestly.”¹ Among a number of examples, he talked about a documentary he had helped make about air traffic controllers at New York’s John F. Kennedy Airport. Filming was taking place in the air traffic control tower, and one of the controllers there was “quite a plane spotter, and he quite often went out on the runway anyway, so I said ‘why don’t we do some stuff out of the tower?’” Simon’s instinct was to get closer to the planes. Although the sense of planes being “dots on the screen” was “part of the story,” Simon thought it would be a good idea to get closer to these “great big lumbering beasts” and to “actually get down on the runway with this guy because he was a fantastic talker.” Simon explained what then happened:

We got down there and then this amazing fog came in and it was one of the most extraordinary sequences ever and the guy was amazing. I thought “that’s fantastic,” a plane was coming through the mist and taking off when it was almost not supposed to be, and you kept seeing great big jumbos lumbering by about 30, 40 feet away. We were really close, and with this guy, these big, big planes lumbering by, and his dialogue, it was just amazing. I thought “we’ve really got this right. We’re on a winning streak here. Because we’ve persevered and because we’ve tried so hard and because we cared so much, we’re now reaping the rewards and our luck is in.” Just after this happened, there was a cloudburst and it was all [over] in a few hours, and the next thing the planes started taking off again and going up into the sky because the mist eventually cleared with this rainstorm, and I was getting these amazing things called vortices, which is where you get these amazing capes of mist and things surrounding the planes. Although that’s been filmed before by people, even the air traffic control people said those shots were really amazing. The planes were taking off with these great capes on them and you could just see the wind flow, like little wind tunnels. We went back to the hotel and we looked at some of it on the monitor and we were just so happy. We thought “yeah, we really did it; today we really did it. If we don’t live another day . . .” and we got there, for once we got it right . . . Just to occasionally get it really right and to really hit the nail on the head and actually just express something perfectly so you can walk down the street on air and think “I got that right . . .” There’s a lot that goes into that to get to that situation, but if you do get there, boy, it’s satisfying.

There is here not only delight in capturing the planes close up, a matter of unusual access, but also pride in having captured on camera striking and unusual footage. Simon quietly includes reference to the admiration and recognition of the air traffic controllers – perhaps suggesting a proxy for the audience that might eventually see the film – and that of his collaborating peers. Although of course his story involves an element of self-aggrandisement, it also conveys the shared, cooperative pleasures possible when good creative work is achieved.

Simon’s account allows us to consider the issue of good work we raised at the beginning of the chapter in terms of the individual experience of one man – one worker. Yet the quality of work is also a matter of social justice. For access to such work is highly unequal, and it is only possible under certain circumstances. This makes it important to consider what precisely constitutes good jobs, occupations,

and careers. And if we are particularly concerned with media production, as this book is, then we need to consider whether media jobs are good ones.

We explore these issues in the following way. In the first section of this chapter we discuss a number of significant critiques of media work that have appeared in recent years. During this time there has been a remarkable rise in studies of creative or cultural labor. It is now more than reasonable to speak of a turn to cultural work in the social sciences and humanities. Much of this research has emerged from media production studies. We want to examine the normative assumptions underlying some recent accounts, and we also want to address the implications of such accounts for constructing a *politics* of creative media work, including the kind of emancipatory social action necessary to make access to good work, including good creative work, more equal and just. This, we claim, needs to be a central element in the analysis of production in media studies. In the second part of the chapter we develop a model for the analysis of good and bad work in general, which might be applied to creative media work. In doing so, we bring together the analysis of media production with the analysis of work in general, drawing on sociology, philosophy, and social theory. In our view, this is a long overdue move in media, communication, and cultural studies. In the third and final section we draw on qualitative empirical work conducted in the independent television sector in the UK and Germany for the purpose of analyzing some of these issues. We show the complex coexistence of positive and negative features in one particular media occupation.

Critical Analysis of Creative Labor

The problem raised by a number of recent critical studies of media work is whether the attractiveness of this kind of work might be a kind of seduction, which encourages workers to accept unjust and/or exploitative labor markets and working conditions. This, in particular, has been a line pursued in what might broadly be called “cultural studies” approaches to media work. A large part of the motivation here has been to counter some of the complacency surrounding creative and new media work on the part of policymakers (perhaps especially creative industries policy) and some of their academic cheerleaders who extol the benefits of creativity and entrepreneurship. These cultural studies-influenced writers have drawn, to varying degrees, on sociology and social theory concerning work and organizations for their examinations of new media and creative labor. In some analyses, the influence of poststructuralist studies of work and organizations has been particularly apparent.²

Gillian Ursell’s (2000) early contribution was innovative because it drew attention to the potential importance of ideas, developed in other fields, concerning how “subjective desires for self-actualisation” can in many cases be harnessed to business goals (Rose, 1999, p. 145). Ursell therefore was drawing attention to the particularly high levels of personal investment in media work – something that had increasingly

been noted by sociologists of work and by organizations concentrating on other fields (such as Kunda, 1992 on high-tech engineering), but that, somewhat surprisingly, had hardly been applied to the media industries at all.³

Discussing how notions of creativity, talent, and work are being redefined in those burgeoning micro-businesses of the cultural sector associated with young people, including fashion and design, but also entertainment industries such as clubbing, recording, and magazine journalism, Angela McRobbie (2002a, p. 523) echoed Ursell in pointing to the utopian aspirations involved in the “attempt to make-over the world of work into something closer to a life of enthusiasm and enjoyment,” and in focusing on how this leads to a situation where, when things go wrong, young people entering these creative worlds of work can feel they only have themselves to blame. In this respect, McRobbie usefully broadened the study of creative work to encompass a wider set of conditions and experiences, including the way in which aspirations to and expectations of autonomy could lead to disappointment, disillusion, and “self-blaming.” She also pointed to the gendered aspects of these conditions – women being now expected to find full-time work, uninterrupted by family commitments, satisfying, and enriching (p. 521). The context for McRobbie’s critique (see also McRobbie, 2002b) was the then UK Labor government’s creative industries policy and their general valorization of labor, where “work comes to mean much more than just earning a living; it incorporates and takes over everyday life” (McRobbie, 2002b, p. 99). McRobbie was usefully questioning the “ideal of self-expressive work” (2002a, p. 101) and its place in Labor’s advocacy of “a new youth-driven meritocracy,” involving a labor of love and self-exploitation.⁴

Similar issues have also been explored by other researchers in relation to work in the information technology (IT) sector, forms of work sometimes unhelpfully blurred with creative labor in governments’ conceptions of creative industries. Andrew Ross (2003, p. 9) observed how, in the eyes of a new generation of business analysts in the 1980s, Silicon Valley “appeared to promote a humane workplace not as a grudging concession to demoralized employees but as a valued asset to production.” “New economy” firms, he argued, aimed to provide work cultures that “embraced openness, cooperation and self-management” (*ibid*). But this, showed Ross, was closely linked to long working hours and a serious blurring of the line between work and leisure. Whilst the dot.com working environments of the 1990s offered “oodles of autonomy along with warm collegiality,” they also enlisted “employees’ freest thoughts and impulses in the service of salaried time” (Ross, 2003, pp. 17, 19). Also writing about new media work, Rosalind Gill (2002), in a study of European freelance new media workers, found evidence that features of the work that seemed superficially attractive, such as its informality and its high levels of autonomy, were in fact particularly problematic for women because of the lack of clear criteria for evaluating work, and especially because of the difficulties such informality caused when seeking new contracts.

More recently, a significant intervention has been made by Matt Stahl, who, more than most of these cultural studies writers, brings systemic political economic

questions to bear on creative labor and, in so doing, advances debates about the relationships between capitalism, autonomy, self-realization, and creative labor in intriguing and often valuable ways. Stahl's starting point is how "the personal and political-economic dimensions of the alienation and domination characteristic of capitalist society appear in attenuated forms in popular music" (2006, p. 1). This combination of attention to both political economy and subjectivity is helpful. Drawing on the cultural industries tradition of political economy, Stahl recognizes that various historical forces protect the creative worker from the full force of alienation and expropriation identified as features of capitalism by many of its Marxist critics, most notably from the contradictions arising from creativity-commerce relations. This, along with the attachment of ideals of self-realization to "artistic" careers, makes music and other creative labor *desirable*.

Stahl's aim is to puncture this apparent desirability. In a fascinating range of cultural sites, Stahl sees evidence of intense struggles over the value and meaning of musical production. Rock ideology provides discourses of authenticity that superficially allow for musicians to struggle against capitalism in the realm of culture – even pop acts such as the Monkees (1966–); but this discourse is used by television producers to capture the identification and desires of audiences. The *Idol* (2001–) television franchise shows provide narratives of meritocracy, offering drastic warnings to those who seek to aspire beyond their abilities, whereas contemporary rockumentary, exemplified in the film *DIG!* (2002), offers moral tales about the dangers of taking bohemian excess too far. In all these cases, Stahl claims, we can see signs of the way in which authenticity and authorship are central to accumulation through cultural production. This is particularly apparent in battles between record companies and artists over contracts and legislation concerning creative labor and the rights deriving from it. Just as the primitive accumulation of modern Europe enclosed common land in order to render it private property, copyright provides "a new, inexhaustible common stock out of which new productive property can be generated and a new class of capitalists established" (Stahl, 2006, p. 224).

Stahl's account explains these roles for subjectivity, autonomy, and authenticity in historical terms. The original primitive accumulation of medieval Europe (extended to other realms by European imperialism; see Harvey, 2003) forced production away from the family, into waged employment outside the home. For Stahl, borrowing from Eli Zaretsky (1976), this created a separation between work and life, with the latter "more free" than the former, and this helped to create more personal forms of subjectivity by compelling men and women to look to themselves for meaning and purpose. Eventually, as mental labor becomes increasingly incorporated into production in the twentieth century, such "personal" subjectivity became more important – even central – to capitalism. At the same time, however, the historical compacts between businesses, states, and labor, where the latter traded in autonomy and ownership for decent pay and working conditions, were relinquished. Stahl suggests that the incorporation of subjectivity into capitalism acts as a kind of pacifying device in the era of neoliberalism and that popular music's democratic promise that "you can

do this too” is a particularly salient way in which “liberal society” (a phrase that seeks to cover both capitalism and democracy) promises an end to alienation and appropriation by offering independence and autonomy (Stahl, 2006, p. 23). This has an important economic as well as a cultural aspect. Musicians seem to bypass corporate control by commodifying their identity as property, which can then earn monopoly rents through the copyright system. But this apparent autonomy masks alienation and domination. Only a very few musicians really gain the autonomy and ownership associated with authorship; most musicians operate “below the line,” in ways that render them little better than wage slaves. Stahl suggests that the desirability of creative labor is a version of the way culture serves to affirm capitalist societies.

There are two important theoretical strands underlying Stahl’s analysis. One is a concern, derived from poststructuralism and autonomist Marxism, with “the production of subjectivity” (Read, 2003), which might be better called “the productivity of subjectivity”: the way in which certain modes of subjectivity are necessary and central to a given mode of production. This is apparent in the way in which discourses of authenticity seem to offer a challenge to capitalism, permitting a certain amount of conflict in workplaces (possibly a distinctively popular music version of creativity–commerce relations). Ultimately, though, these discourses are presented by Stahl as sustaining new variants of capitalism, or at least as masking alienation and domination. This understanding derives from the other main theoretical strand in his research, which is a very strong critique of the profoundly undemocratic nature of the relations between employers and employees.⁵

The Debate About Creative Work

In a variety of different forms, then, these cultural studies-influenced critics of media production work have found autonomy and self-realization to be tied to conditions such as self-exploitation and self-blaming. In the strongest version of such critiques, which involve political–economic as well as subjective processes, self-realization becomes a systemic requirement. These critiques have been central to recent analysis of media work and have been very valuable.⁶

Yet there is an absence in this work. In an important contribution, Mark Banks (2007) has partly endorsed the pessimism of many such accounts of creative work (and also, to some extent, of accounts from critical theory and political economy perspectives); but he has also qualified that pessimism, drawing on his own empirical work and on a range of social theorists. Drawing on the work of Ulrich Beck and Elizabeth Beck-Gernsheim (2001) on individualization, Banks finds hope that transformations in modern life have enhanced the possibilities for social action and reflection. He refers to the views of Scott Lash and John Urry (1994) that the cultural industries themselves have provided flows of signs that have enabled genuine reflexivity and independent creativity in modern societies. This is a world away from Theodor

Adorno and Max Horkheimer's (1979) "culture industry" thesis of standardization and pseudo-democratization. Banks sees evidence of such individualization and reflexivity in a number of aspects of contemporary cultural production.

First, says Banks, there are widespread signs that "social creativity and independent artistic production are actually on the increase" (Banks, 2007, p. 102) and a willingness to explore counterrational and radical creative impulses remains alive. The aesthetic realm "continues to provide resources and inspiration to a whole range of social actors, not just artists and creative cultural workers" (ibid., p. 103). Regardless of whether or not this realm is a creation of bourgeois society, a practical belief in it has proven persistently inspiring. This is linked to a broader democratization of the aesthetic domain, which offers capital new opportunities for commodification, but it also broadens the constituency of people who can live a life governed less by accumulation than by the pursuit of aesthetic goals. Related to this, Banks (pp. 108ff.) turns to the Aristotelian concept of *practices* to argue that the pursuit of internal rewards continues to provide a very important part of the motivation of cultural producers. A practice, as defined by the philosopher Alisdair MacIntyre, is a coherent and complex form of cooperative human activity

through which goods⁷ internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to, and partially definitive of, that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved, are systematically extended. (1984, p. 187)

Practices need to be sustained and of sufficient size to include numerous subactivities. Planting turnips is not an example of a practice in this sense, says MacIntyre, but farming is. Kicking or throwing a football with skill is not a practice, but football is. But many activities are practices: "arts, sciences, games, politics, the making and sustaining of family life" (ibid., p. 188).

The notion of *standards of excellence* is extremely important. MacIntyre is defending the ethics of pursuing excellence. *Goods internal to that form of activity* is a crucial phrase too. Internal goods or rewards "are such that their character can only be identified by reference to the specific nature of the practice concerned and its particular standards" (Keat, 2000, p. 23). External goods or rewards are, by contrast, not dependent on the nature of the practice through which it is achieved. These include money, power, prestige, and status.

Banks asks his readers to consider the possibility that there is enough variation within the institutions of contemporary capitalism for practices to be able to endure in modern cultural production.⁸ Internal and external rewards may not be quite so mutually contradictory as is implied by perspectives that see markets as necessarily eroding quality.⁹ What is more, practices can flourish at the expense of market-led imperatives. Firms can act as profit-satisfiers rather than profit maximizers, and this is summed up in the idea of doing it for love and not for money. This can lead to

self-exploitation, but it has another side too, encouraging resistance to the excessive pursuit of external rewards. Banks (2007, p. 120) also claims that moral systems of trust, honesty, obligation, and fairness remain present in contemporary capitalism, and he gives examples of the resilience of social and cultural values among the creative workers he interviewed in previous research. Later in his book, he elaborates on this view by suggesting that we need to think of creativity–commerce or art–commerce relations in terms of a triad composed of orientations toward creativity, commerce, and the social (*ibid.*, p. 184). The idea here is that such a conception would allow us to consider the degree to which creative workers seek not only to live an aestheticized life, but also actively to intervene in social relations. Political and aesthetic goals may often be in tension, in that many may feel that pursuing morality through artistic production undermines aesthetic and “practice”-like aspects of production; others may be looking for some kind of synthesis of the two.

Banks’s contribution is a valuable one, because it suggests the possibility of a more balanced appraisal of the relationships between subjectivity and creative labor than that provided by many of the cultural studies critics. So, too, does the work of Georgina Born. In an essay on the way in which aesthetic value has been treated in television studies, Born (2000) trenchantly critiques debates about quality in television for their relativist unwillingness to adjudicate between producer and audience discourses of quality, and she argues for the importance of analyzing the discourses of media professionals. In particular, Born suggests that researchers should attend to

a category of specifically media intellectuals whose task is to mediate the generic dynamics that bridge the past, present and future of media output. Their skill is in the art of judging how to progress a set of generic possibilities in given conditions, and how to balance the enhancement of the entertainment, pleasure and education of the audience. (*ibid.*, p. 406)

Crucially, this puts emphasis on the *positive possibilities* of cultural production, and it does so by asking when its powers might be used “responsibly, creatively, inventively in given conditions, and when not” (*ibid.*). It also suggests the importance of theorizing agency, reflexivity, and value. In later work that was based upon her own ethnographic research, Born analyzed the “situated ethics and aesthetics” of BBC television producers in documentary, drama, and current affairs (Born, 2004, pp. 84–87; see also Born, 2002). Born does not claim that reflexivity always results in better television; rather, she argues that a key analytical task is to consider how the reflexivity, intentionality, and agency of cultural producers conditions the creativity and innovation possible within a given medium. This task, in turn, she locates within the context of genre theory, stressing the difference between various attitudes to generic change: “nostalgic repetition, the rich mining of the familiar, which may itself be achieved in more and less inventive ways”; “a self-conscious exceeding of the previous horizons of expectation”; and the production of generic stasis, involving the entrenching of given codes (Born, 2000, p. 421).

The tensions between the pessimistic accounts discussed above and Banks's and Born's critical insistence on a more balanced appraisal brings us to the fundamental problem raised at the beginning of this chapter: *to what extent is it possible to do good work in the media industries?* For, if the high levels of autonomy and the enhanced possibilities for self-realization that some sociologists (e.g., Ezzy, 1997; Sosteric, 1996) have identified as features of good work and that seem to be present in the media industries lead in the end only to self-exploitation, then these supposedly desirable forms of labor look bleak indeed. Is creative labor, then, really barely disguised "bad work"? Might it even be a particularly modern form of bad work, where the subject's desires for autonomy and self-realization become folded into systems of discipline and accumulation? It seems to us that these debates rely fundamentally on assumptions about, and on interpretations of, the subjective experiences of workers; and it seems only right to listen to and observe creative workers reflecting on their work, while taking into account the probability that their relationship with their own experience will often be opaque. In order to address these questions, we need to develop and draw on theorized, historicized accounts of the forces shaping cultural production. And, as we have explained, an important "intermediate" level – one between the subjective experiences of workers and the historical and systemic forces that structure those experiences and are, in turn, at times structured by them – is that of the organization: the level where work in the cultural industries is managed, coordinated, and divided. In the remainder of this chapter, two different strategies are employed. The first is to outline an approach, developed more fully elsewhere (Hesmondhalgh, 2007; Hesmondhalgh & Baker, 2011a), that might clarify the normative dimensions of creative media labor – in other words it might clarify what the relations are between attractive and problematic elements of media work. The second is to draw on qualitative and ethnographic empirical analysis of subjective experience to illustrate some of the ways in which a particular site of labor combines good and bad work in complex ways.

Toward a Model of Good and Bad Work

We are not alone in considering explicitly what might constitute good and bad work. Writers have used various terms for "good" and "bad" and have developed various frameworks. Randy Hodson (2001), in his invaluable summary of numerous ethnographic studies, uses the concept of *dignity* as the basis of his assessment of contemporary work, and he outlines ways in which workers experience challenges to their dignity: mismanagement and abuse, overwork, incursions of autonomy, and problems of participation and involvement. Below, we draw on Hodson's useful deliberations and we comment on his categorization. His concept of dignity is a valuable one, but we feel that simply to use the qualifiers "good work" and "bad work" allows us more flexibility and helps us more easily to cover the normative ground.¹⁰

A helpful and comprehensive discussion of research on “good jobs” is provided by the economist Francis Green in his book *Demanding Work* (2006). Green identifies six aspects of job quality: skill levels (because skills are “the means by which people have the potential for self-fulfillment,” *ibid.*, p. 16); work effort or intensity; personal discretion over job tasks and participation in workplace decisions; pay; low risks and security (in terms of health and safety and of job tenure); and job satisfaction and affective well-being at work. Green is dealing almost entirely with “objective” aspects of work – “objective” in the sense that they would be widely agreed upon to be quantifiable and measurable.¹¹ It will become apparent that some of his categories overlap with ours, which focus on subjective experience. Leaving such issues aside, we repeat that our concern is primarily with the exploration of subjective states and of people’s reflections about them (and with forces that might shape such experiences); and this concern is best pursued through the kind of qualitative work we have undertaken.

In his 1964 book *Alienation and Freedom*, the sociologist Robert Blauner took up the concept of alienation, suggested by Marx and Durkheim, and attempted to provide a more careful specification of it, so that it might act as a basis for research.¹² In our view, Blauner’s discussion remains useful, because it is an unusually bold and transparent effort to develop normative concepts for the analysis of work. What’s more, Blauner was helpfully clear that the concept of alienation had only an indirect relationship to questions of human happiness. In his view, work was rarely experienced as either entirely miserable or totally pleasurable. This is surely right. Our discussion will look primarily at elements of good work understood in terms of *the experiences of individual workers*. By good experiences we do not mean happiness, joy, or even pleasure – though these may be fleetingly part of the experience of work. Labor often involves an element of struggle, difficulty, and compulsion, even for those who “like” or “enjoy” their work. To seek happiness in work might be to invite disappointment, as it inevitably involves frustration and struggle. We need other conceptions of good and bad work (or of unalienated and alienated work, in Blauner’s terms) beyond happiness and pleasure.

Blauner offered a thoughtful outline of four types of work alienation, which he felt were of particular significance in modern societies: powerlessness, meaninglessness, isolation, and self-estrangement. There are problems and contradictions in his categorization, in his choice of terms, and in his discussion. We point to these problems in what follows and we develop our own conceptualization, building on Blauner’s thinking and on that of other social scientists and philosophers who have studied work in the interim.

An alternative word for the freedom and control that Blauner sees as the positive opposite pole of powerlessness is *autonomy*. Hodson discusses the importance of autonomy, which he feels to be particularly central to professional and craft workers, whose jobs “depend on the daily exercise of autonomy in relation to tools, techniques, and work priorities” (2001, p. 140). Workers in these *relatively* powerful and high-status forms of work often have a very uneasy relationship with managers and

greater power in relation to management than many other workers. Hodson also states that such workers often report greater levels of job satisfaction and meaning, and greater levels of creativity at work, than workers in other types of occupation. Many creative workers, we will argue, can be thought of as craft and professional workers, and they seek forms of autonomy – though with crucial differences deriving from the particular status of aesthetic autonomy. Autonomy is such a difficult and disputed concept that we must refer readers to discussions elsewhere (Hesmondhalgh & Baker, 2011a). Nevertheless, it is a crucial normative concept for work as a whole (not just for the professional and craft workers whom Hodson discusses), and perhaps especially for creative work as part of media production.

Turning to the concepts of meaninglessness and meaningfulness, Blauner seems to use these in two different and rather narrow ways. One refers to the worker's sense of the whole process of production, or her lack of it. But it is not clear here whether Blauner's main concern is with the effects of this condition on a worker's individual autonomy (that she becomes unable to exercise discretion because her own role is strictly delimited) or with its effects on a worker's level of absorption and interest (the job is *boring* because its relation to the whole is not understood, or felt to be of concern). The former aspects are best dealt with under autonomy. The latter are important aspects of work. It may be best actually to use terms such as *interest*, *involvement*, and *absorption*, or *detachment* and *boredom*, rather than *meaningfulness* and *meaninglessness*, which might best be reserved for the second way in which Blauner uses them – to refer to awareness of the purpose or, better still, to the social and cultural value of products, and, linked to that, to the goals of the organization producing them. We think it is best to deal with issues concerning good work in relation to the social and cultural value of *products* separately from process, and we return to this question of value briefly in the next section (see also Hesmondhalgh & Baker, 2011a).

Blauner's discussion of isolation is marked by an appeal to the value of integration into a community that is not unusual for US sociology of the mid-twentieth century. One danger of Blauner's take on this is how easily integration into work organizations might, under profit-making systems, become a way of encouraging a false sense of unity among workers, in the interests of profit-maximizing firms. Yet, if we modify our conceptualization of it, it may be possible to talk of isolation as a feature of bad work. The desirable opposite of isolation might be better conceived of as *sociality* than as *membership*, and the merits of sociality might be conceived of in terms of the values of friendship, solidarity, cooperation, and *shared* enjoyment and interest. Hodson writes that co-workers "provide the social fabric that is often crucial for meaning at work" and "a significant line of both formal and informal defense against managerial fiat" (Hodson, 2001, p. 18). This conceptualization of isolation and sociality is developed elsewhere.¹³

Most problematic of all is Blauner's conception of self-estrangement. This merges three different aspects of good and bad work: discussion of the "alienating" experience of boredom or of the "non-alienating" experience of interest or absorption;

questions regarding the relation of people's work to self-esteem; and their sense of fulfillment and development over time. We have already mentioned above that the first of these, interest or lack of it, is a separate feature of our model. The second element in Blauner's discussion of self-estrangement, *self-esteem*, also needs to be separated out, as it is too important to be merged into a broader category. It matters that work can enhance or diminish our sense of self-esteem and, related to this, our sense of others' respect for us and recognition of our work.¹⁴

The third element of Blauner's discussion of self-estrangement, people's sense of fulfillment and development over time, is in our view extremely important in relation to good work. Concepts such as career, vocation, and calling indicate widespread desire to sustain good work over time. The term we want to borrow to refer to this aspect of good work is *self-realization*. This has its origins in translations of Hegelian ideas about humanity's historical achievement of its own potential, and it has come to refer to "the fulfilment by one's own efforts of the possibilities of development of the self" (the Oxford English Dictionary's definition). The idea has roots that go deeper than those of the English word. Articulated by philosophers such as Rousseau and John Stuart Mill, it is a core goal of post-Enlightenment thought. Later, Freudian psychoanalysis sought to increase the individual's understanding and awareness for the sake of the development of the self. By mid-twentieth century, however, the idea of self-realization had become attached to popular therapy movements that some writers see as deeply bound up with problematic forms of individualism (Illouz, 2007, p. 45). The humanist psychologist and early management guru Abraham Maslow placed "self-actualization" – realizing one's own personal talent or potential – at the top of his famous hierarchy of needs: when other, more basic needs (physiological needs, needs for security, love, and esteem) were met, then self-actualization, "the desire to become more and more what one is," could serve as a motivating force for human action (in *ibid.*).¹⁵

One problem with the concept is that, in contemporary culture, notions of self-realization and its close relative, self-actualization, are often not far removed from narcissistic forms of competitive individualism. Life-coaching guru Anthony (or Tony) Robbins, for example, offers books, recordings, and classes that use the concept of self-actualization to show us "how to awaken the giant within" (Robbins, 1992). It is possible, then, to see a focus on self-realization as mere evidence for a "culture of narcissism" (Lasch, 1980). The German social theorist Axel Honneth has argued that, increasingly in the twentieth century, "members of Western societies were compelled, urged or encouraged, for the sake of their own future, to place their very selves at the center of their own life-planning and practice" (Honneth, 2004, p. 469). As a result, individual self-realization becomes linked to "institutionalized expectations" and "transmuted into a support of the system's legitimacy" (*ibid.*, p. 467).

Do such developments make self-realization irredeemable as a normative concept? Not necessarily (and Honneth does not think so either). The concept of self-realization need not be an example of out-of-control narcissism or competitive individualism. Progressive collectivist political projects generally involve some kind of notion of

self-realization. Jon Elster claims for example that, while Marx thought that communism would be better than capitalism for a number of reasons, he also condemned the latter “mainly because it frustrated human development and self-actualization”; this was the other side of Marx’s much more sketchily portrayed concept of alienation. Communism was a society in which people could “fully realize their potential as all-round creators” (Elster, 1985, p. 83). Nor does the appropriation of the term by management gurus and therapists diminish its importance in understanding human life. The fundamentally ambivalent achievements of psychoanalysis (see Zaretsky, 2005) include an emphasis on the pursuit of healthy self-realization, and, at its best, this can involve working toward a reflexive understanding of the limits on this goal. Our aim here is not to advocate a Marxian or psychoanalytical concept of self-realization, but to point out that the term need not be linked to competitive individualism or narcissistic fantasies about individual triumph. It can serve as the basis of ethical discussions concerning the place of work and of creative labor within conceptions of human well-being and social justice. It makes it possible for us to discuss how work and other key elements might contribute to a (pluralist) notion of successful development of the self over time.

Some vital aspects of bad work appear to be missing from Blauner’s breakdown of alienation. The improvements in working conditions in the United States in the 1950s and 1960s may have led him to assume that problems of job *security* and *overwork* were not sufficiently important to be included in his framework. Or it may be that Blauner did not consider these to be aspects of alienation *per se*, but part of some broader problem of pay and conditions. Whatever the reasons, these surely need to be included in any consideration of the quality of work as experienced by workers. It is true that, under his categories of powerlessness and control, Blauner recognized that control over the pace of work was critical and constituted “the most insistent, the most basic aspect of a job” (1964, p. 21). But to subsume it under control seems not to do justice to this importance; moreover, this is only one type of overwork.¹⁶ Hodson categorizes overwork as one of the major challenges to dignity in the workplace and, together with the intensity of work, he also considers excessive hours. Employees work too hard and too long not only where they lack autonomy, but also in cases where there are contradictions of employee involvement. Programs calling for heightened employee involvement, such as work teams, quality circles and so on, have the potential to increase responsibility and dignity at work, says Hodson, but “they also can be used manipulatively to pressure workers to work harder and to increase output through intensified self-supervision and peer pressure” (2001, p. 20).¹⁷ All this relates to the question of balancing the emotional, physical, and time demands of work with other aspects of life, including caring for the young and the elderly, contributing to communities, and simply enriching one’s life through leisure.

Insecurity is an interesting term, because it has an objective, measurable sense, which concerns conditions and length of job tenure; but it also has a widely used subjective meaning, too. When we say we feel insecure, we suggest that we lack a

sense of safety. At work, this might involve threats to physical health through injury and contact with harmful substances, and the physical effects of mental states such as anxiety and stress. But workers, especially those on short-term contracts, might also feel insecure about their futures. There are other dimensions too, related to ethnicity, class, gender, and age. One of the most important contributions to sociology of work in recent years has been Richard Sennett's exploration of the "corrosive" effects of flexible work (1998). In his chapter on risk (*ibid.*, pp. 76–97), he writes about how the current conditions of corporate life are "full of prejudices against middle age, disposed to deny the worth of a person's past experience," and treating the middle-aged as averse to *risk*; and he traces the disillusioning effects of this mentality on Rose, a New York bar-owner who tried to break into advertising.

We have now encountered a number of the main elements comprising our model of good and bad work, one which is substantially different from Blauner's model of alienated and unalienated labor. To summarize so far, we have outlined a conception of good work as involving autonomy, interest and involvement, sociality, self-esteem, self-realization, work–life balance, and security. This is coupled with a conception of bad work as involving – conversely – control by, or dependence on, others; boredom; isolation; low self-esteem or shame; frustrated self-realization; overwork; and risk.¹⁸

Let us clarify our purposes here. We have spent some time clarifying these normative grounds because (a) the quality of working life is a fundamental matter for everyone, not just for creative media workers; and (b) the analysis of creative media work has neglected any extended consideration of these issues so far. However, in order to make such clarifications, we acknowledge that our discussion has had to be somewhat abstract. So we now relate the above conceptualization to media work by drawing upon ethnographic fieldwork (see also Hesmondhalgh & Baker, 2011a). In particular, we focus on questions of autonomy and self-realization.

Working in Television: Documentary Development

In what follows we draw on an ethnographic study¹⁹ in order to analyze the personal experiences of cultural workers in relation to the above model of good and bad work. In particular, we are talking here about labor in the television industry – more specifically, in independent production companies specialized in documentary and factual programming.²⁰ The study focused on the development process of television production, that is, the first stage in the production process, during which ideas for future programs are conceived and further developed into program proposals to be pitched to broadcasters and other funding bodies. Development work involves the brainstorming of new ideas and researching content and context. This might include who and what might be filmed, and where. A crucial aspect of development is the presentation of such research in the form of written proposals

to broadcasters, who of course act as the main financiers and distribution platforms for independent television producers. Development teams of researchers, producers, and assistant producers (AP) are led by the head of development (HoD), who coordinates and guides the activities of the team, in conference with the companies' executive producers.²¹

A marked feature, in both companies that were studied, is the high degree of independence for workers of all levels and responsibilities. For example, they exercise discretion over their work tasks: over the time, the order, and the way in which these work tasks are carried out. The workers comment positively on this form of *autonomy*, and in some cases they even value it more highly than financial gain. Other forms of autonomous work include working from home, having relatively flexible work hours, having an individualized work schedule, and enjoying a lack of (close) supervision. All this is clearly appreciated by workers, as the German head of development explains when asked about what she enjoys about her work:

Today I only got here at 2 pm, I did not have to justify that to anyone for example. The job needs to be done, how I do that is entirely left to me. In the end I am a freelancer for [the company], a service provider. Nobody is looking over my shoulder every five minutes, that's really nice. [. . .] The style here is very delegating. It would be hard for me if it was any different. It's quite a luxury and for that I happily put up with the not-so-great pay.

Even at the more junior level of researchers and assistant producers, where workers are given greater guidance in their work, the specific execution of work tasks is largely left to the individual. This autonomy provides workers with a sense of responsibility and contributes to work motivation and satisfaction. The standard recruitment phrase – “able to work independently” – seems to be a practical requirement for this type of work. This is apparent in the following statement by the German HoD:

I don't fancy at all telling you exactly what to do down to the very last detail. That's no use, because then I can do the job myself, really. But that also requires a high degree of independence and self-reliance, and there are people who you have to explain every little bit of shit to and they are just not suited. Someone who can't work independently is not suited to the job. You never do anything twice. Everything changes all the time and you have to be extremely flexible.

Autonomy in documentary development concerns not only issues of work organization but also creative activities and decision-making. This is a major factor in the attractiveness of television labor and, potentially, an important contribution to self-realization. The degree of creative autonomy in the independent television sector is closely related to the hierarchical position of a worker. Some creative input in development involves all members of the team. But decisions about the creative content or style of a program and about whether an idea is further

developed or rejected are made by workers in more elevated positions – notably the head of development and the executive producers. These more “creative” elements of project development concern for example the conception of new program ideas, including potential narrative structure and visualization, and the writing of program proposals. Such activities can be carried out by a team – for example in brainstorming and development meetings where every worker can equally offer input – as well as on an individual basis. Workers, even at the junior level, have the freedom to “run with an idea” and “shape it” (an HoD, UK) – that is, to further develop what might be just an issue or a problem into a full concept for a TV program, including narrative perspective, choice of specific content, locations, and potential contributors. The evaluation of such creative efforts is reserved for senior workers, who decide about alterations and future actions regarding the project. The British HoD describes this process as follows: “So it’s not that I’m being told initially, this is what you must do, it’s that I’ll go to them [the executive producers of the company] with what I’ve done and then we’ll move it from there.” Executive producers consequently have the highest degree of creative autonomy. This is a central part of their motivation for work. In both case studies, they are co-owners of the production company, and creative independence in the creation of TV programming was a central reason for setting up the companies in the first place, as one British executive producer describes: “We were three filmmakers who thought that we would like the opportunity to work on our own rather than within [a broadcasting station] where we all worked.” Nevertheless, there are also elements of dependence and control in this setting, where conflicting views might exist. For example, during the fieldwork a junior worker expressed criticism of a senior producer’s insistence on continuing research for a project despite a persistent lack of success in the junior worker’s search for matching contributors. On other occasions workers insisted on the potential of a project idea, and they did so against skeptical views or rejection from the executive producers or from the HoD. In addition, there are dependencies at a larger level that influence the degree of autonomy, as executives need to consider economic rationalities and their dependency on their broadcaster “clients” in their decision-making.

In addition to autonomous work, there are other desirable features of working in television in general and in factual and documentary production in particular. Such features contribute to a sense of fulfillment and *self-realization* beyond material rewards, and they are sought out by workers in the course of their professional career. In spite of having different work roles and responsibilities, workers share many values that provide them with work satisfaction, and even with pride. In our case study such values include creativity (as addressed above), variation, and the (potential) impact of their work. Program making for television is perceived as a creative activity.²² The capacity to reach a large audience means that this creativity has the potential to be widely shared (see Hesmondhalgh & Baker, 2011a, chapter 9). To be involved in this process is considered attractive – as this development producer from the UK describes:

It's quite exciting, you feel like you're in the fast lane of stuff. You're where it's happening, you're where programs are getting made and that's what the country is seeing on television. So that – it's really exciting. And I like Channel 4, if you'd said to me, "who'd you like to work for, what programs do you watch?," I'd say Channel 4.²³

Fulfillment through work is strengthened if work responsibilities coincide with personal interests and preferences, as in the case of this worker's personal preference for Channel 4 programming. The German HoD considers such an overlap of work and personal taste a specific advantage of her job, as it provides her with the opportunity to follow up personal interests through work projects. This blurring of boundaries between work and leisure can be a problem, but it also has its potential pleasures and rewards. The issue here isn't so much excitement *per se*; it's that the excitement derives from the ability to realize one's sense of self by pursuing work projects that comply with one's sense of what is ethical, interesting, or of high quality – a sense that, in the case of media producers, is partly (though of course not entirely) built up through media consumption (other sources include family, education, and religion).

Workers further value the variation of their everyday work both with regard to the kind of activities involved and with regard to the program content they develop, as – so it is claimed – "you never do the same thing twice." Although processes and methods follow specific patterns, every project has a different story and requires an individualized approach. This development researcher from the UK considers this an attractive aspect of her work: "And it's an exciting job, and you learn stuff every day and you meet new people whereas working on dramas apparently from what I've heard is really boring, and soaps and all this kind of thing is really dull." Contributing to documentary programming carries a particular value for workers in this sector due to the genre's potential for portraying social reality, for performing critical investigation, and for influencing audiences' views of the world. Workers talk of countering ignorance and prejudice and of the opportunity to "change people's perception" and to "make them think" as ideal outcomes of their efforts. This is of course closely linked to a notion of politics, or at least of ethics: a goal of contributing to the well-being of others. Variation and impact also relate positively to *interest and involvement*, regarded as elements of good work vis-à-vis the social and cultural value of the products the workers create.

Workers accept that there are limitations to their roles and responsibilities, and they accept the degree of autonomy and self-realization that is available to them; but often they compare their work positively to other jobs. A strong sense of personal career development that involves a belief in future career progress encourages workers, especially junior workers, to accept compromises with regard to interest and involvement, autonomy and self-realization in their current work role. By moving up in the hierarchal structure, they expect to have greater opportunities for creative autonomy and self-realization, as well as larger monetary rewards. At the top of the ladder in the independent sector are executive producers who, as in our case study,

are often (co-)owners of their businesses and possess a high degree of creative autonomy and control with regard to the programming they create and a strong sense of self-realization as successful creatives/program makers *and* entrepreneurs.

However, this sense of potential progress can be understood as a way in which workers come to accept dubious features of media work. There is an enormous oversupply of workers, and the television labor market is extremely competitive. Most workers will never reach this level of career status. Yet career-building and future work satisfaction provide strong motivations for television workers, which ultimately facilitate the acceptance of exploitative elements such as overwork and insecurity among workers as a necessary evil in exchange for the privileged opportunity of self-realization. One UK executive producer even claims that “it’s not a job, it’s a vocation.” Working overtime, working on weekends, working while unwell, and changing one’s personal plans to accommodate work are typical features for all workers, and they are particularly intense the higher the worker’s hierarchical position.

For example, one German worker jokingly complained about her boyfriend forgetting what she looks like because she had to work so many hours. The HoD in the same company kept an air bed in the office to sleep on for a few hours when doing night shifts – which happened several times during the observation period. On another occasion, a producer and a director commented on the fact that they were finishing their work for the day at an unusually early hour (5:15 p.m.), and the producer encouraged her colleague, who had two young children, to go home, as his family would be happy to see him in person once in a while rather than just talking to him on the phone. So workload and the *work-life balance* are frequent topics of conversation between the workers; and sacrifices in private life for the sake of good work performance are critically or empathically commented upon, but accepted as normal – just “part of the job.” In the German case study this became a kind of competitive element between some of the workers, who seemed to show off or overtrump each other with the excessive numbers of hours they worked.

Pressures such as high workload and tight deadlines do not only impact on the workers’ work-life balance, they also limit *autonomy* in the workplace. As the British HoD observed, “I haven’t got the time to have a lot of freedom but I do have the option to have a lot of freedom.” But overwork is not only down to managerial decisions within the company, for example understaffing or the use of inexperienced but cheap labor, or a result of the nature of project development whereby many projects need to be “juggled” at the same time. It is also caused, and often, by the company’s “clients” – such as broadcasters and funding bodies whose requirements and deadlines guide the activities and work priorities of the development team. For example, in the British case, the company was asked on a Thursday night, by a commissioning editor at Channel Five, to develop ideas for an observational series by the coming Monday morning. This left only Friday to brainstorm and contact sources for research and access during business hours, and eventually most of the team was feverishly involved in this task. The HoD and an executive producer then worked over the

weekend to prepare their suggestions for the broadcaster. During the first week of our observation in the German company, a project idea about the future of food for the Franco-German culture channel ARTE had to be researched, written, and presented to the commissioning editor over the course of five days (Thursday to Tuesday), in order to meet an internal deadline at the targeted broadcaster, which involved weekend work and very long work days for the two-person development team of HoD and the observing researcher.

The general acceptance of overwork is facilitated by the *lack of job security* in the independent television sector. All workers (except for the executives) are employed freelance or on short-term contracts (ranging on average between 3 and 6 months) and, especially at a junior level, workers are subject to a high degree of uncertainty about what will happen when their contract ends. In many cases workers' contracts were repeatedly renewed, on a short-term basis, especially if work relations were successful and the company was satisfied with the performance and commitment of the workers – including their readiness to work extra hours. Workers at a senior level, such as the head of development, are employed freelance, but in a more long-term, though non-fixed, appointment. However, their higher levels of security, pay, and creative autonomy also subject them to higher performance pressure and to substantial personal investment in their working life. Several workers said that, despite their insecure and uncertain working conditions, they enjoyed the flexibility of the employment structure, as it provided them with more variety in their working life and with more control over the development of their career. Nevertheless, insecurity is a central concern for television workers. One AP expressed the view that her ideal employment model would be “a steady part-time job that paid the rent and the rest freelance work”; and this attitude is typical of many workers in this industry.

Closing Comments

As is the case with most occupations, work in television is not good or bad *per se*. Rather, we have observed a complex and sometimes contradictory combination of elements of good and bad work.²⁴ The results confirmed that autonomy and self-realization can be thought of as positive characteristics of television work, but at the same time workers experience negative conditions in the form of overwork and insecurity. On the whole, though, the workers observed in our studies perceived insecurity and overwork as manageable pressures, given the satisfaction they gain from autonomous work and the opportunities for self-realization. Part of this is the *excitement* of being involved in television and building a successful career in this area. For many, this tips the scale toward a positive experience of their work life.²⁵ We further argued that these features of good and bad work are common to many workers, but the degree of their influence differs according to workers' position in hierarchies. Working in television can offer many workers, at all the hierarchical

levels, an experience of good work; but positions of higher seniority seem to provide more opportunity for autonomy and self-realization. Career-building becomes a central objective for television workers and elements of bad work are temporarily accepted as a worthwhile investment for a better (professional) future.

The recent boom in studies of cultural and media work is potentially a vital contribution to media production studies, which might be accused of having neglected media production as *work*. But an adequate normative conceptualization of media work depends upon a much closer engagement with other disciplines that have also analyzed labor, occupations, and careers. We have tried to show, by surveying a wide range of recent research and by drawing upon our own empirical analysis, the potential benefits that such an engagement might bring, by developing a more fully conceptualized scrutiny into the nature of contemporary media labor.

NOTES

- 1 This example is drawn from fieldwork conducted by David Hesmondhalgh and Sarah Baker, carried out between 2006 and 2008 in three different industries (television, magazines, and music), and funded by the UK Arts and Humanities Research Council. See Hesmondhalgh and Baker (2011a).
- 2 Approaches to production inspired by the interdisciplinary project known as cultural studies tend to draw on understandings of the relationships between subjectivity, meaning, and social power on the other more than other approaches do. Here we pay less attention to what might be called “political economy” approaches to media work, but see Hesmondhalgh and Baker (2011a, 2011b) for further discussion. For definitions, and for an attempt to clarify discussions about the relationship between these two sets of approaches, see Hesmondhalgh (2007, pp. 29–50).
- 3 It is worth pointing out that this is somewhat different from a Marxist critique. Building on groundbreaking studies of the formation of “consent” in workplaces by Marxian sociologists such as Michael Burawoy (1979), Ursell acknowledged that processes such as union de-recognition and considerable reductions in labor costs and earnings provided plenty of evidence to support a Marxist reading focused on exploitation and property. But she also noted “an intensification of the self-commodification processes by which each individual seeks to improve his/her chances of attracting gainful employment” (Ursell, 2000, p. 807) and analyzed how television workers had, in the era of casualization and increasing freelance work, come to take on the work of organizing their own labor markets.
- 4 On the idea of the “creative industries” and its adventures in global policy, see, among others, Hesmondhalgh (2007) and Ross (2009).
- 5 Stahl refers approvingly to David Ellerman (1992), for example, who sees work in capitalist modernity as being based on an illicit hiring and renting of people – which, in the private sphere, fundamentally contradicts democratic norms and values established in the public realm. Capitalist modernity is therefore seen as being at odds with itself. The problem is that this relies heavily on a notion of self-ownership that, Gerald Cohen (1995) convincingly argues, undermines collectivist claims for justice.

- 6 Though there have also been significant contributions from organizational, business, and management studies (McKinlay & Smith, 2009) and from the political economy of culture (Mosco & McKercher, 2008). For discussion, see Hesmondhalgh and Baker (2011a).
- 7 "Goods" here is used in the sense of "rewards" rather than "things to be possessed." And, in case it isn't clear, the term "practice" is being used here in a specific philosophical sense rather than in the broader sense, recently made popular in social and political theory; it is used, namely, to refer to the importance of understanding societies in terms of routinized forms of action and understanding (Schatzki, 1996; Warde, 2005).
- 8 To do so, Banks draws on Russell Keat's (2000) impressive modification of Alisdair MacIntyre's ideas discussed above.
- 9 A perspective that was to be found in postwar cultural policy, for example; see Garnham (1990, p. 158) for criticism of this tendency.
- 10 Russell Keat (2009) makes a similar move to ours, preferring the phrase "good work" to the phrase "meaningful work" as the latter is discussed by a number of political philosophers such as John Rawls (1971) and Adina Schwartz (1982): "work that is interesting, that calls for intelligence and initiative, and that is attached to a job that gives the worker considerable freedom to decide how the work is to be done" (Arneson, 1987, p. 522).
- 11 The obvious exception is Green's category of subjective well-being. The use of survey data to measure other aspects of well-being besides wages is a welcome development in economics, even though there are many very difficult conceptual issues surrounding the operation of expressions such as "job satisfaction" and "well-being" in surveys. The move is welcome because it goes beyond the one-dimensional model of the person in neoclassical economics (for a critique, see Nussbaum & Sen, 1993). Our concern is qualitative, but we would be very pleased if this made a contribution to the building of theory that might help to refine well-conducted survey work concerning labor.
- 12 Blauner's study was conducted on factory workers in four different manufacturing industries, and he was interested in the way new forms of automated technology might actually serve to reduce alienation. Our concern here is not with this aspect of his book, but with its conceptualization of good and bad aspects of work.
- 13 One prominent variety of modern Marxism, often referred to as "autonomism," puts special emphasis on the possibilities that solidarity and cooperation in modern forms of work might encourage broader forms of social solidarity, which could bring about revolutionary transformations in society. See Hesmondhalgh and Baker (2008, 2011a).
- 14 In recent years, matters of esteem have been pushed to the fore in political theory by contributions that have argued for and against the idea of *recognition* as the basis of justice and of other normative claims. See Nancy Fraser and Axel Honneth (2003); and see Beate Rössler (2007) for a discussion of the politics of recognition in relation specifically to work.
- 15 Creativity was tied closely to this. As Maslow himself put it, "the concept of creativeness and the concept of the self-actualizing, fully human person seem to be coming closer and closer together, and may perhaps turn out to be the same thing" (Maslow, 1971, quoted in Illouz, 2007, p. 45).
- 16 Green (2006, pp. 47–49) provides a valuable discussion of conceptualization and measurement (through surveys) of work effort or work intensity.

- 17 This kind of internalized commitment to work, resulting in overwork, is a key part of the critical case “against” creative labor in recent years. See, for example, Andrew Ross (2003).
- 18 These elements relate mainly to the experience of the *process* of paid work. However, as we indicated above in our discussion of Blauner’s concept of meaninglessness, there are crucial further dimensions to our understanding of good work – dimensions involving *the social and cultural value of products* (Hesmondhalgh & Baker, 2011a). A notion of good work that involved only workers’ experience of the labor process would risk severing the ethics of work from the ethics of production.
- 19 The study involved five months of participant observation in the development departments of a British and a German production company in 2008, as well as interviews with the observed workers. In total 10 workers from different hierarchical levels were interviewed, ranging from researcher to executive producer. For reasons of confidentiality the identities of the workers and of the companies have been anonymized. See Zoellner (2009, 2010) for further discussion. Both studies reported in this chapter (by Hesmondhalgh and Baker, and by Zoellner) made use of participant observation – a key method in the analysis of media production and of labor.
- 20 For another significant study of labor in the independent television production sector, see David Lee (2008).
- 21 The size of project development teams varies even among middle-sized companies; it can range from a single person to whole teams in single or even double figures per company, and in some cases workers switch within a company between development and production.
- 22 Though of course there are different work roles with varying degree of creative involvement. See Hesmondhalgh (2007, pp. 64–65) for an overview of the division of labor in the cultural industries.
- 23 This development producer was employed on a fixed contract, and she specialized in developing program ideas for Channel 4. As part of her work role, she liaised with executive producers and commissioning editors.
- 24 For a similar analysis of work across three industries – television, music, and magazine journalism – see the empirical research reported in Hesmondhalgh and Baker (2011a).
- 25 Workers may of course be coping with the negative conditions of their work through a certain amount of denial. However, those negative conditions can become overwhelming and workers might consider a career change as a result of a lack of opportunities for self-realization. This was the case, for example, with one of the observed development workers in the UK. He expressed frustration over the conditions he encountered in television production. In particular, he found the short-term nature of work contracts a severe burden, but he also had a deeper problem with the overall approach of television documentary. The development producer was in his twenties, he had a background in science and worked as a science communicator prior to his employment in television. To “see science on television in creative ways” was one of his main motivations to work in the sector, and he was disappointed by the superficiality and sensationalism that accompanied much of contemporary science programming. As a result, he considered a career change if his current contract was not to be renewed.

Community Media Production

Access, Institutions, and Ethics

Ellie Rennie

ABSTRACT

In policy terms, community media are known as the “third sector” of the media. The description reflects the historical expectation that community media can fulfill a need not met by the commercial and public service broadcasters. A defining element of this “need” has been the means to production for nonprofessionals, particularly groups not represented in the mainstream media. The historical construction of community media reveals production to be a guiding principle; both a means and an end in itself. This chapter examines the various rationales underpinning community media production, including empowerment, media diversity, and the independent producer movement. Using case studies from youth media, the chapter critiques producer-centric models of community media. In the contemporary media environment, production alone cannot meet the social needs that community media were established to address. Instead, I propose a rationale that combines both production and consumption ethics.

Production is more than the day-to-day work of community media organizations. When taken to mean part of an industrial cycle, production is central to the theoretical underpinnings that have defined, and to some degree determined, how community media should be accommodated in the media landscape. Advocates have argued that the means of production should be available to all, extending community access not

only to production skills and program resources, but also to communication spaces and technologies. Broadcasting reforms in many countries have helped institutionalize community media through access measures that enable amateurs and community representatives alike to take part in media production. In this chapter I trace the intellectual history of community media, looking at production as a defining rationale both in practice and in policies. In the digital age this rationale needs rethinking, as new technologies both enable and complicate not only access to the means of production but also the ability to institutionalize critical media structures. In the final section of this chapter I consider issues of ethical consumption as a new way forward for thinking through the role of community media in the digital age.

The community media I refer to in this chapter emerged during the mid-twentieth century, when media production was restricted to a few dominant participants. For instance, in the USA and Canada, early community media production via public access television – that is, public, educational, and government access (PEG) – existed both as alternatives to and in negotiation with large, commercial cable television companies (Fuller, 1994). In time, community media have grown into their own sector of national media landscapes. In Australia, what began as a handful of experimental radio stations in the 1970s became officially, in 1992, the third sector of broadcasting, after commercial and public service. Today it is the largest sector of the media in terms of number of broadcast licensees.

Community media exist in all corners of the globe, and, although demands for community media have not decreased, their place within the broader media environment is changing. When I first started to produce and write about community media in the mid-1990s, community stations were the only real means for amateurs to distribute sound and video content to broadcast publics. Mainstream media offered a few avenues for public expression, such as home video programs, letters to the editor, talent shows, and talkback radio; but they ceded no editorial control or ownership of their content. Community media gave people a more direct means to access media platforms and to control production processes and content. In the current media environment, however, the community media sphere has been crowded with other noncommercial, citizen-led forms of media production. Individuals may contribute “user-generated content” to communities, but this content is mostly distributed across commercial sites such as YouTube. Government broadcasters may bring more people’s voices into media content through digital storytelling or content-sharing hubs, such as the Australian Broadcasting Corporation’s Pool project (<http://www.pool.org.au>); but, while they provide access, these projects seem to rely on national companies. Indeed, these days it is often easier to access and participate in mainstream media outlets, which is due to their advanced technologies, better bandwidth, and public branding campaigns.

If access and institutions alone do not distinguish community media, then we need to identify what community media may do differently from commercial or government-funded media. I posit that community media are something that participants choose because of the values they uphold. If the dilemma of the new media

environment is identifying and navigating the abundance of media production and consumption outlets, then the benefit of community media is that they offer a value-based system for these forms of media participation. The historical foundations for theorizing community media provide a starting point for thinking through the values of these media in the digital media age, turning our focus to the politics that underpins a later consideration of ethical consumption over participatory production as a way to retheorize community media.

What Are Community Media?

The phrase “community media” refers to media that originate in civil society, outside of commercial and governmental control. Although there is a long-standing debate in the field as to whether “community media” is too broad a description to be useful, I choose it to reference the community sector as a field of action that operates with aims and purposes different from those of commercial enterprises and government agencies. Those who participate in community media often do so because they are attracted to these aims and purposes as alternatives to other media, and this leads some to call community media “alternative media” (Atton, 2002, 2004; Comedia, 1984; Duncombe, 1997). The phrase “community media” on the one hand suggests organizational structures that are unique to the community sector, while on the other it encompasses the loose ties and informal arrangements that connect people and provide impetus for alternative types of relationships between producers and consumers.

In this relational sense, “community” can mean kinship connections, but more frequently it designates other social bonds. The term is often used to appeal to a sense of belonging or to a shared identity. A community can be a worthy or a functional group. It can suggest a warm or coherent way of living together. At other times, it can simply refer to people who share geographical proximity or cultural affiliation. As philosopher Iris Marion Young (1990) has pointed out, though, “community” can also be an exclusive and narrow term, signifying a social arrangement that promotes a denial of its members’ differences. By appealing to an impossibly shared subjectivity, a community can mask or justify an “us versus them” mentality, resulting in racism or other forms of social divisions.

A community can also be put to work as a way of consolidating and advancing social causes. It possesses political usefulness, in that it refers to associations and groups that make up the third sector – including organizations that represent particular affiliations, and formal or informal networks that may promote particular causes, interests, or hobbies. The third sector includes large charities and small clubs, which are driven by factors other than profit-making and may provide services that government has either failed to fulfill or are best left outside of government jurisdiction.

As a whole, the community media arena is therefore an organic sphere of social affiliations and networks, as well as of the structures that support such groups in

order to ensure that they can fulfill their social and cultural goals (Rose, 1999). The third sector gives space to a myriad of activities that may be independent of government and commerce, but that can also be leveraged to achieve certain ends associated with the state, such as services, or with the market, such as development. Beyond this, the third sector can also fulfill the social or cultural needs of its participants, whether they be producers or consumers. It is this final operational use that I will return to later in relation to community media ethics.

Community media can include local public access media, diasporic news and culture, media development projects, and various forms of culture jamming. Some scholars resist the description “community media,” because potentially it includes less progressive communities in these fields. It stands to reason that, if the phrase “community media” implies universal media access, then that would include people from communities that provoke hatred and unrest. I am less concerned with what should or should not be included under the community media umbrella than I am with the structures that support community media’s ability to thrive as a third sector. In my own work, I have chosen to use community media, as they convey the attempt to take what is part of the social world – as in those relationships we call “community” – and to institutionalize them in media. Community radio stations in Australia, for example, are “exactly the type of institutions that define the contours of civil society,” in that they are “self-governing nonstate actors that exist as non-profit-seeking expressions of the mutual and collaborative intent of ordinary people to effect social change through discursive means” (Fairchild, 2010, p. 25).

This definition does not make community media an alternative expression of citizenship, or something radical by nature (see also Rennie, 2006), but it also means that community media are not free of structural constraints. In Australia, community broadcasters must be incorporated associations and operate as not-for-profit entities in order to receive licenses. Structural constraints for community media vary by country, region, and locality; these reflect the various struggles that community groups frequently faced in order to achieve community media legislation. Early fights for community radio and television, for example, centered on access to the electromagnetic spectrum – that is, the “airwaves” needed for analog broadcasts. More recent fights have related to cable or satellite transponder capacity, and they were followed, even later, by battles for affordable broadband access. The resulting policies have formed a patchwork of requirements and guidelines for making community media.

Today the various programming groups that use community stations are often less formally organized than the third sector itself. Some participants, such as independent producers, student filmmakers, and sports clubs, may work independently, without committees or rules. Individuals belonging to these groups might actually prefer to use commercial or government media to publish their content online, but they may find it easier to access community organizations for radio and television broadcasting. These facts introduce several tensions into the ways community media have been defined and practiced.

Community media policy, where it exists, is designed around the needs of producers and of the communities they represent. Without specific laws and regulations that apply specifically to community associations, community media have proven to be vulnerable to commercial or state interests. At the same time, producers may see themselves as working independently of a community association, or he or she may reject officially registered affiliations altogether. This makes formal requirements for community governance difficult to achieve. Moreover, non-profit regulations that ensure that community media do not behave commercially may guarantee public access to stations, but they may frustrate those producers who use, or even prefer, commercially available platforms and production technologies. These tensions, embedded as they are in the definition of community itself, are present in theories of community media, which have focused on issues of access to, participation in, and control of the means of media production.

Theorizing the Importance of Production and the Means of Communication

The production process has been a key focus of community media theories, which can be traced to origins in Marxist social theories, in particular those of Walter Benjamin and Raymond Williams, and in critical media studies. Community media theories have developed concepts, such as access, participation, and control, which help imagine alternative means of production, across both social and material processes (e.g., Kellner, 1990).

Walter Benjamin, an influential German intellectual writing during the Weimar period, was perhaps the first to introduce the idea of an alternative means of production. Benjamin was associated with the Frankfurt School, which set forth a critique of mass media as a capitalist institution that sealed the fates of a subordinated working class. In 1934 he gave a speech to the Institute for the Study of Fascism, at which he argued that publishing ideas, even from a critical viewpoint, is not enough to alter society. The creator, he insisted, must look at his or her position within the system as a whole, including the production process. Only by critically realigning where the work sits in relation to the “forms and instruments of production” (Benjamin, 1982, p. 214) can social change occur. Benjamin desired the advent of socialism, but what mattered most was whether cultural work transcended the bourgeois processes that upheld capitalism. Production, he asserted, needed to be freed from market influences in order to be truly revolutionary; simply expressing challenging ideas would never change the system if these ideas were distributed through the industrial press. Benjamin’s speech has been adopted in contemporary critical media studies as a way to understand the role and purpose of left-oriented segments of community-based media, particularly those outlets that seek to challenge mainstream media.

To this, Raymond Williams, a thinker who profoundly influenced the development of cultural studies, advanced Benjamin's groundwork for community-based media. Williams claimed not to subscribe to the idea of a mass culture. He wrote: "There are in fact no masses; there are only ways of seeing people as masses" (Williams, 2001, p. 46). His theory of culture embraced liberal humanism in that it insisted on the individual as a free agent and on culture as mutable and contestable at the level of everyday experience. In his later work, however, Williams came to accept Marxism and to focus on the institutions and production forces behind people's agency and on their everyday cultural experience.

Asserting that the means of communication – everything from simplest forms of language to communication technologies – is socially or materially produced and reproduced, Williams (1980) regarded umbrella terms such as "media" unhelpful, because they conceal the different ways in which communication occurs, as well as usage and control of their means. The means of communication are not just forms, but means of production, containing economic forces as well as social relations. For example, the press relies on unequal social relations, whereby those who do the manual work of printing do not write the ideas, a situation that makes them "instrumental in the transmission of the writing of others" (*ibid.*, p. 58). From a critical perspective, the supposedly free press essentially reinforces class divisions between "those who have something to say and those who do not" (*ibid.*). For Williams, socialism required more than the basic "recovery" of human capacities that capitalist forces have taken away. Instead, it needed the "necessary institution of new and very complex communicative capacities and relationships" (*ibid.*, p. 62) – in particular, new forces and new relationships in the means of communication. Only by changing the productive relationship between community and communication could one make social transformation occur. Williams found a practical example of such transformation in community radio, "already within our reach" in 1978, and in the possibility of what he called "multi-way interactive modes, which can take us beyond 'representation' and selective transmission into direct persons-to-persons communication" (*ibid.*, p. 61). Williams thus imagined social networking as a practice that potentially subverted the undemocratic production forces that dominated other media forms.

The intellectual frameworks surrounding community media thus came from a leftist, anti-capitalist intellectual arena, stemming from attempts to understand culture as part of the broader political structures that assisted and inhibited the freedoms of the majority of working people. The ideal of using communication means to develop alternative structures of production and thus to subvert unequal social relations has been a platform in international relations and global debates over communication rights since the 1960s; this platform can be summed up as "the right to be informed, the right to inform, the right to privacy, the right to participate in public communication – all elements of a new concept, the right to communicate" (CRIS Campaign, 2005, p. 17).¹ Its influence remains strong in relation to what other scholars have called alternative media, grassroots media, participatory media, radical media, or even development media. For some, who have participated in these global

debates, community media became the site for realizing a movement, “even if the [community media] groups themselves were acting independently of the [. . .] debate and [were] largely unaware of it and often of each other” (ibid.). Although many of the community media outlets proliferating over the past 30 years had no political intentions at all, their collective presence challenged media ownership and control structures by being independent from corporate or state interests. This became the core focus for some community media researchers and policy advocates (for instance Hazen & Winokur, 1997; Aufderheide, 2000).

For other community media researchers, however, the focus on production processes as the *raison d’être* for community media projects has led many groups to assert that participation is in itself a radical project, providing an alternative to mainstream media structures. Communication rights, after all, remain a marginal issue in policy spheres. Despite their official recognition of community media, “[t]he codification of communication rights in international agreements – let alone the widespread recognition that communication is a basic human need as well as a fundamental human right – is no guarantee that these rights are respected or upheld within and between nation-states” (Howley, 2010, p. 7). Further, many scholars have questioned whether community media are capable of changing broader media structures to any great extent. Changing the means of production on a large scale has proven to be a complicated task, involving “problems of effective access, of alternatives to class and state control and selection, and of the economics of general distribution” (Williams, 1980, p. 58).

In defining what she calls “citizens’ media,” for example, Clemencia Rodríguez (2001) sees the transformative potential in the act of participation and in the agency inherent in media production. Rather than overhauling ownership and control of the media – as inferred in Benjamin’s earliest articulations – Rodríguez claims that the importance of citizens’ media resides at the local level, in disrupting power relations in everyday life and in opening up the possibility for empowerment. She concludes that:

Even if the information and communication channels are left untouched, even if the mainstream media structure is left unaltered, citizens’ media are rupturing pre-established power structures, opening spaces that allow for new social identities and new cultural definitions, and, in a word, generating power on the side of the subordinate. (ibid., p. 160)

Attempts to impose order, or to scale up community media, could even threaten the subtle achievements of small-scale media. For instance, some have argued that a number of community radio stations in the United States lost touch with the grassroots by changing their programming and practices when Public Broadcasting Service (PBS) money became available (see Walker, 2001).

The revolutionary intentions of reclaiming the means of communication through collective ownership or participatory production have been influential, and they are

evident in several national community media policies. While they differ on the needs of producers and of the communities they represent, these policies are often framed by the general language of participation and by the need for media to be accessible to producers from that community. Examples of how community participation and access have been enshrined in legislation include the following facts:

- The Council of Europe's Declaration on Community Media 2009 states that community media are not-for-profit in nature, are independent, and involve the "voluntary participation of members of civil society in devising and management of programmes" (CM/Del/Dec(2009)1048/5.1E).
- The South African Broadcasting Act of 1999 includes requirements that community radio licensees must be "managed and controlled by a board which must be democratically elected, from members of the community in the licensed geographic area" (Government of South Africa, 1999, Broadcasting Act 4, section 32(3)). Programming must "reflect the needs of the people in the community which must include amongst others cultural, religious, language and demographic needs" (section 32(4)).
- The Broadcasting Act of Canada states that the Canadian broadcasting system should be comprised of "public, private and community elements" (Government of Canada, 1991, 3(1)(b)) and must "include educational and community programs" (3(1)(i)(iii)). The regulatory authority defines community radio as "owned and controlled by a not-for-profit organization, the structure of which provides for membership, management, operation and programming primarily by members of the community at large. Programming should reflect the diversity of the market that the station is licensed to serve" (Canadian Radio–Television and Telecommunications Commission, 2000, paragraph 21).
- In Ireland, community radio stations are "owned and controlled by a not-for-profit organization whose structure provides for membership, management, operation and programming primarily by the members of the community at large" (Broadcasting Commission of Ireland, 2009, p. 3).
- The UK includes "the promotion of civic participation and volunteering" in its definition of the social objectives of community radio, as outlined in the Community Radio Order 2004 (Department of Culture, Media and Sport, 2004, section 2(3)(g)).
- In Australia, legislation provides that community broadcasters "encourage members of the community served to participate in the operations of the service and the selection and provision of programmes" (Commonwealth of Australia, 1992, Schedule 2, Part 5 (2) (c)).

These incantations toward community participation sit strangely among communications laws otherwise focused on concrete matters of public resource allocation, responsibilities toward audiences, and market controls. Such policy concessions have been mostly a way to accommodate a gap not filled by commercial or public

broadcasting services, rather than a way to challenge those systems. In practice, the motivations behind community media production and distribution are diverse, as can be seen through the following examples of interlinked community media endeavors in the city of Melbourne, Australia.

Participants' Motivations for Community Media: Three Examples

Three different instances of community media, all created for and by young people, illustrate the diversity of community media: organizations based on access and participation; organizations intended for development or social change outcomes; and the less structured groups of amateur creators that choose to work outside of the mainstream media. Together, they demonstrate that the diversity of community media is not just cultural, but that different institutional structures are created to achieve different outcomes. The first two examples exist within third-sector structures, while the third example is intentionally informal and avoids institutionalization.

Access and Participation: SYN

Student Youth Network (SYN) is a youth-run community radio licensee that has been operating full-time since 2003. I spent two years getting to know this station and researching the dynamics of youth radio, which was different from the student radio that emerged in universities in the 1970s. The original student stations were no longer as accessible to young people, as volunteers stayed on, grew older, and the culture of the station changed with them. In order to avoid this fate, SYN insisted that programmers had to leave the station on their 26th birthday and limited the amount of months per year that an individual radio announcer could be on the air.² I began researching SYN partly to see why young people – the so-called “digital generation” – might want to establish an old-fashioned community radio station. Couldn't they simply carry out their media activities online? After a while I began to see that the station was a central point of their production.

The station was a place where young people could come together. It enabled a more complex form of media engagement, including a real work environment and access to a sizable audience of approximately 80,000 listeners weekly. Those who might have reasonable levels of what could be called “informal digital literacy” learned how to structure stories, to be articulate to a public, and to manage their media time and resources. The “SYNners,” as they called themselves, did not always succeed in making innovative content or changing media routines. Not everyone left

with a positive, well-rounded experience or with new means for self-expression. However, if it was a coherent and successful project all the time, then I suspect it might not have been enough of a challenge for those involved. The constant influx of new people meant that the organization had a tendency to repeat mistakes. Yet the same organizational policies that encouraged turnover also ensured that the station has remained accessible and that its content has never gone stale.

SYN has become more multiplatform in its operations than many community broadcasters, partly because those involved have been open to learning and producing across a range of media that they distribute online. The radio station is still the entry point into the organization for many, particularly for school groups that come to SYN through its many training programs. This has been the main income source for the station. SYN is an example of an organization that is committed to access and where community participation produces positive outcomes, such as innovation, as well as obstacles, such as lack of experience and of professionalism.

Social Change and Development: YouthWorx Media

It is fair to say that the young people who come into SYN of their own accord (for instance not those in school groups) are mostly already confident with, or interested in, media production. The founding SYNners were aware from the start that disadvantaged young people were less likely to get involved. They formed partnerships with various youth organizations, including a large project that was developed by SYN in association with the Salvation Army and Swinburne University. The YouthWorx Media project, as it is known, is an example of what has been called development or participatory media – which brings me to my second example of the different motivations underpinning community media. The phrase “participatory media” has been used mostly in the context of media projects in the Third World, entailing media projects established by non-governmental organizations (NGOs), with strong direction from local communities toward social change outcomes. The intention of participatory media projects is to give communities control over the messages and information in ways that are culturally and politically appropriate, together with skills and livelihood opportunities (Gwinn-Wilkins, 2000; Servaes, 1999). Although much of the literature on participatory media applies to these Third World projects, the same approach is used in First World countries for certain “disadvantaged” segments of the population, such as at-risk youth or public-housing residents.

YouthWorx Media has provided access to technologies and skills in the same way as SYN, but with a greater level of support, using networks with various social services and schools. Aside from media production, YouthWorx has focused on other outcomes, such as building the confidence of participants, encouraging teamwork, responsibility, and providing paths to schooling and education. Unlike the SYNners, who were mostly already at school or university, YouthWorx participants could get training for future credentials. Although YouthWorx has produced good content

under the guidance of professional media trainers, the emphasis is, just as much, on providing those involved with a space where they can be free from the problems of home or of the streets. YouthWorx has thus been a more directed and deliberate endeavor than SYN. It has acknowledged that access, on its own, does not necessarily meet all needs.

Amateur Authority and Aesthetics

At the opposite end of the spectrum from YouthWorx and SYN is the community media production sphere of zine makers. Zines are “non-commercial, small-circulation publications which are produced and distributed by their creators” (Spencer, 2005, p. 13). The stories and artwork contained in zines are produced by an individual, or (less often) by a group. Zines avoid some of the barriers of media regulation and distribution by virtue of being small-circulation print media. In this respect, they are not unlike participatory media online. Zines disrupt the boundary between consumer and producer and are produced via nonprofessional methods and systems.

Stephen Duncombe (1997, p. 120) calls this form of media production “do-it-yourself,” as in “You did-it-yourself because no one else out there was doing it. Or because when they did it, they got it horribly wrong.” Punk zines, for instance, began appearing because punk music was ignored in music magazines. When mainstream media appropriated the punk aesthetics, punk zines “kept it real” for members of the subcultural community. Media participation, in this context, encompasses anyone who cares enough to get involved. In fanzines (zines about a particular show, product, author, band, and the like), the work is a way for the audience to claim a productive role in relation to the object of its consumption. In some instances, that might mean hostile or satirical engagement; or, at other times, celebration or extending characters and narratives into new territory, beyond the original author’s intention (Jenkins, 2006). The amateur methods of zines also encourage others to create. Sometimes this is a deliberate call to arms, as are instructions on how to make a zine. Other zines simply encourage by example. Duncombe describes one instance in which *Punk* interviewer Legs McNeil departs in mid-interview, leaving musician Richard Hell to complete the interview himself. Zines thus strip the authority from the notion of producer. Such proudly amateur behavior proves that “anybody can do a better job as an interviewer than Legs” (1997, p. 119), opening up the playing field, about which Duncombe writes: “This notion of emulation – turning your readers into writers – is elemental to the zine world” (ibid., p. 123). A final and related point is that zines are deliberately amateur in their look and in their “closeness” to the subject, making no false claims to objectivity or professional distance. In the zine world the amateur aesthetic is often deliberate, a choice to remain streetwise rather than polished or mainstream. You don’t have to be good at making zines to make a zine; the creator’s prerogative overrides skill as the main credential.

As zines show us, there are structures even at the deinstitutionalized end of the community media spectrum. The intentions, values, and differentials of zines define

an “alternative” sphere of media making, which is part of the community media sphere but may also exist outside or in spite of it. Although zines are not a core part of SYN’s activities, the organization has hosted the occasional zine workshop. I travelled to the annual youth festival This is Not Art, in the regional city of Newcastle, Australia, with a group of people from SYN. The festival hosts the country’s largest zine fair. The zine makers I met there spoke of their attraction to the low-fi aesthetics and the production process for zines. Although zines hardly qualify as community media, much less as a media movement, their popularity and connections to other community media forms and practices raise important issues about theories of community media that presuppose means of production, access, and participation as the core definers of community media.

Beyond the Limits of Community Media Theories

Theoretical debates about community media focus on their values and on whether community media can form part of a coherent political movement. This debate includes the limitations of community media policies in effecting social changes and the expansive possibilities of digital technologies, which have further blurred distinctions between producers and consumers. Yet to retheorize community media in light of their politics at the current conjecture requires that scholars include a discussion of community media consumption and ethical consumer choices in their discussions of production means and values.

Researchers Marisol Sandoval and Christian Fuchs (2010) critique participatory production as the main theme in theorizing community media, centering instead on the problem of visibility as a crucial platform for what they call alternative media theory. For them, alternative media cannot challenge “all forms of domination” in an age of fragmented public spheres, nor can they foster “societal alternatives to capitalism” when sustainability relies either on stable financing or on self-exploitation (ibid., p. 141). In their view, the history of small-scale participatory media often shows that they remain marginal precisely because they have rejected professional processes that would allow them to reach broader audiences more efficiently (ibid., p. 143). Small-scale media cannot achieve such an ambitious project as overturning the current means of production, they argue. Rather, the success of alternative media depends on the visibility of critical media content across public spheres. Citing the philosopher Herbert Marcuse, they write: “This means that alternative media at some levels can also employ capitalist techniques of media production in order to advance their political aims. Alternative media can make use of capitalist structures and at the same time criticize these structures” (ibid., p. 146). For them, professionally produced and financially solvent magazines on the political left, such as *Mother Jones*, *The Nation*, and *Z Magazine*, should be included in a cohesive theory of alternative media that conceptualizes access, social change, and alternative values and aesthetics

in terms of the ability to challenge and critique the economic inequalities that prevent participatory democracy.

While Sandoval and Fuchs's critique is not completely new,³ their point that alternative media are not an antidote to capitalist media suggests that community media need to go beyond participation as a good in and of itself. Writing on her experiences with OURMedia/NUESTROSMedios, an international network of hundreds of participatory media groups, media researcher and activist Gabriele Hadl (2007, p. 17) argues that, while the network's diversity is its greatest strength, its "fuzziness" around shared concepts and goals is a weakness. Framing the problem as an obstacle to any unified community media movement, she reflects: "It has become increasingly clear that a way must be found to connect nuanced analysis and effective practice" (*ibid.*, p. 16). Hadl's point is important precisely at this moment, when publics worldwide are beginning to hold a neoliberal/neoconservative agenda accountable for a series of global social and environmental damages, including the buying and selling of personal data. Community media have the opportunity to challenge the ways their audiences are sold to corporations in the digital media environment, whether through Google searches, Facebook networks, or YouTube uploads and downloads. Community media producers sometimes rely on these corporately owned technologies, but they do not have to be complicit with the aims of these services.

The participatory production process can advance the dominance of commercial media, and therefore it can no longer be viewed as a means of challenging such power on its own. While this is a matter of content visibility, as argued by Sandoval and Fuchs, it is also a matter of creating governance structures for a media third sector that upholds noncommercial governance practices. Hence we return to the conundrum inferred decades ago by Williams: How do we enhance the visibility of communities through media already dominated by a capitalist mode of production?

In their handbook on communication rights, the Communication Rights in the Information Society (CRIS) Campaign critiques the concept of freedom of expression as individualistic and unmindful of power inequalities. Its authors write: "It can do little to prevent the loudest voices" (CRIS Campaign, 2005, p. 22). Communication rights, on the other hand, entail communicating, that is, speaking and being heard.

While freedom of expression guarantees that we can speak our thoughts freely, it by no means guarantees that another can or will listen and (re)transform such speech into new thoughts and actions. Communication rights thus imply, at least in part, the initiation of an ongoing cycle, without which language is just so many dead words. (*Ibid.*)

"The right to be heard" is a relatively new concept in community media theory that stretches theory beyond production and into consumption – or "listening," as some prefer to call it (Couldry, 2006; O'Donnell, Lloyd, & Dreher, 2009). To begin to listen, however, audiences need to know that ethical media systems already exist; they need to be able to find what it is they are looking for and to enjoy it when they do. This

calls for new systems and strategies: education campaigns, and possibly even ethical labeling systems for non-profit community media.

Audiences expect community media to be different from mainstream media in upholding different principles. Some of these limitations, such as the lack of advertising, have also made community media clearly recognizable to audiences. In the online environment, such limits and constraints either do not exist or are hidden from public view. The only way to know if something is community media online is if that site says so; and, even then, *caveat emptor*. The multinational corporation NewsCorp owns MySpace, for example, which often uses the term “community media” to describe its website (Reiss, 2006). Audiences need to be able to recognize what community media are and how to evaluate their content.

Community media online operate very much according to the same ethical values as community media in other places do. They frequently allow for open access and amateur participation in running the organization and in developing existing technologies in order to serve identifiable social needs rather than market niches. Community media avoid using personal information for marketing and tend to consider ethical issues when it comes to advertising. Nor do they intentionally impose technological gatekeeping to restrict the ways users access information. Knowing these aspects of their production, community media audiences use an ethic of care in the construction and participation of community media. A similar type of care is also found among audiences in commercial sites, but this usually occurs after rights have been infringed or audience trust has been lost. For example, online communities have pressured YouTube to enact communication rights according to a perceived mutual responsibility between the patron platform and its users:

The specific issues raised as part of these complaints work to reveal the implicit “social contract” that had structured their participation, but which is only made explicit once it appears to be broken, at which time discourses of entitlement, fairness, and labour politics emerge. (Burgess & Green, 2008, p. 13)⁴

The ethic of care in community media, on the other hand, is pre-emptive, something that occurs not in relation to corporate behavior, but as a foundation principle that enables the user to know what he or she is dealing with before he or she gets involved.

The ethical consumption of community media suggests that the consumer has at least some power to effect social change by making choices based upon his or her moral values. The individual and collective aspects of production operate in tandem with those of consumption. Although consumption is an individual act, the systems that enable such a choice to be made are collectively organized, either as a cooperative venture or through a central body. The Fair Trade label, which is applied to products such as coffee and crafts, promotes “good” labor and environmental production practices, encouraging ethical compliance in work. The labeling system also entails an educative role, in that consumers need to be informed of the consequences

of their purchases in order to make a choice in favor of fair trade. As the choices consumers make are subjective and based on a changing environment and culture, their ethical choices are not statically fixed, but are part of the changeable moral system associated with the condition of postmodernity⁵ (Bauman, 2001; Littler, 2009).

If a “Fair Trade-like” ethical system were applied to community media, it would require effective navigation methods, adequate visibility, as well as efficiency in the networks that define and aggregate community media into a global movement. If there are real differences between the ways in which community media function and behave by comparison with media from other sectors, then the issue is how to make those differences explicit. Producers and consumers both have to navigate through the available and abundant content on the Internet. Whether they post content on a particular site or enter into a public discussion forum with friends, all citizens need to make informed decisions about their engagement in the new media landscape. This may involve solutions such as labels or classifications that alert audiences and producers when they come across a community media outlet that offers privacy assurances or encourages open-source technologies. A more subtle approach would be navigation tools (such as search engines) that show how social networks, linking, and recommendations already enable ethical choices for media engagement.

Conclusion

Questions of access and participation in production alone are insufficient for understanding and defining community media in a digital media age. Community media theories inherited some of the blindspots of Marxist theorists, who focused on who controls the means of communication or the social contexts in which media are produced, rather than on media audiences or consumption. As David Morley points out, this body of work has a tendency “to prioritize the study of ‘production’ to the exclusion of the study of all other levels of the social formation” (1989, p. 33). As the boundaries between audiences and producers collapse, the dynamics of consumption, navigation, and networks must now be taken into account.

Why not assist audiences and producers to know community media through an ethical choice label or system? Studies of Fair Trade commodities highlight the contradiction inherent in ethical choices: that even critics of capitalist market practices must participate in commodity culture. Critical scholars have frequently dismissed consumer movement ethics as complicit with market capitalism – the very system that created the class inequality that the consumer seeks to redress by buying better products (Littler, 2009). Consumers can also exhibit willful ignorance, avoiding or not seeking out information on some products in order to avoid the potential inconvenience that comes with knowledge and responsibility (Brown, 2009). Such limitations deserve consideration in relation to community media choices, especially

when individual choices implicate universal communication rights and the traded goods are not material products, but information flows. Issues such as these require further testing and theoretical enquiry.

The implications of these ethical issues are not simply theoretical, however. If scholars, policymakers, and practitioners continue to describe community media only in terms of media production, then the risk is that community media will be lost in a sea of participatory or user-generated content, and this vital rebalancing of the media system will remain marginal. The answer for community media makers and users does not need to be an embrace of mainstream distribution channels or a compromise with the institutional structures of the third sector. The defining features of community media can remain intact, including dedication to communication rights and/or to small-scale organizations. Yet the question of visibility must be addressed; for making values and methods clear to the consuming/producing public will only become more important in the future. What we are seeing is the arrival of ethics in the realm of consumer products that is not led by the labor movement – producers, as the Marxists and critical theorists assumed – but is “fuelled in large part by moral and material revulsions generated by the affluent lifestyle itself” (Soper, 2008).

I have only touched upon the many issues involved in community media consumption here. The intention of this chapter, however, has been to re-examine debates on media production as a guiding framework for understanding community media and to raise some doubts as to their applicability in the new media environment. Critical media studies, including Raymond Williams’s account of the means of communication as a means of production, retain valuable insights into what it means to include so-called “ordinary people” in the media production cycle. Community media have enabled participation and emulation and have brought amateur innovation into the media system. The rise of the Internet, which has been judged as “too nano” in the past (Downing, 2007, p. 3), has meant that such forms of production can no longer be ignored.

To truly take community media seriously, however, we need to ask difficult questions, to do with ethics and with how certain structures and even technologies (open source versus proprietary software, for example) shape the media environment. Although these issues are being addressed within the community media sphere, definitions based on production alone fail to take account of community media’s role in maintaining communication rights.

NOTES

- 1 Specifically, the UNESCO debates on the New World Information and Communication Order (NWICO) centered on the free flow of information, particularly news values that reinforced the dominance of the global North and West, the impact of foreign ownership in poorer countries, and the difficulties of maintaining cultural integrity against the tide of international media, in other words “cultural imperialism” (see MacBride, 1980).

- 2 See Rennie (2011) for a full history of SYN.
- 3 John Downing (2001), for example, writes that using any binaries as starting points in distinguishing alternative and mainstream media would be ultimately false and unhelpful in reinforcing the marginality of alternative media.
- 4 Jean Burgess and Joshua Green (2008) use the example of the backlash toward Oprah Winfrey's YouTube channel by users who saw the site turning into a "one-way" channel for a big media company, which could edit front page-featured videos, thereby exploiting user-generated videos for its own interests.
- 5 By "postmodernity" I mean the state of living in a society where the defining principles of modernism – rationality, hierarchy, and the assumption of absolute knowledge – are no longer in place. In the works of Bauman (2001) and Littler (2009), consumption (rather than production) drives economic and cultural life, contributing to a moral complexity that is a distinctively postmodern phenomenon.

Neglected Elements

Production, Labor, and the Environment

Richard Maxwell and Toby Miller

ABSTRACT

This chapter applies a materialist, ecological approach to analyze the physical environment in which media production takes place, focusing on media-related occupations across global supply chains. We argue that conventional production studies have too narrowly circumscribed this sector and that more comprehensive research on media production labor is needed. We critique the idealism and pro-growth ideology that draws production studies toward both a focus on consciousness and the so-called aristocracy of talent. Our aim here is to find ways for media production studies to help establish a just system of environmental accounting, which challenges the creative industries to stop stealing from the Earth and from working people in the name of growth.

Only recently have we started to understand the negative impacts of digital electronic equipment worldwide. Most of us, overwhelmed by the technological wonders that these devices are capable of, forget to ask ourselves “How have they been made?” “By whom?” “Where?” “Under what conditions?”

The increasingly faster and more versatile computers, appealing mobile phones, high-definition TVs, Internet, tiny music players, ingenious photo cameras, entertaining games consoles and even electronic pets give us the idea of a developed, pioneering and modern

world. It is indeed a new era for many; but the dark side of this prosperous world reveals a very different reality, that far from taking us to the future, takes us back to a darker past.

CEREAL (Centro de Reflexión y Acción Laboral, 2006, p. 4)

This chapter aims to expand the conceptual boundaries used by contemporary production studies to analyze the media industries' impact on the environment and exploitation of labor "below the line" – below writers, producers, executives, directors, actors, and managers. We consider a larger number of occupations within media production that are essential to digital electronics, from mining metals to assembling low-value parts. This broadens the scope of technologies that count in "media production" so as to include anything with a circuit board and any media process or device that uses water or electricity.

We hope to show that production studies can benefit from this material approach. In that spirit, we begin with a brief critique of production studies' residual idealism, which we think keeps the subfield from distinguishing itself within media studies and diminishes its independence from the industry it takes as its object of research. Then we address the media's environmental and labor impact and oppression, and we explain how a green, materialist analysis can employ supply chain research to widen the purview of production studies. Before we conclude with suggestions for further research, we offer a brief case study of the political economy of Mexican *maquiladoras*, a key site for international production studies. Along the way, we hope to model changes needed in the long, valuable history of cultural research into media production.

Production Beyond Consciousness¹

In writing this chapter, we were fortunate enough to benefit from the legacy of a remarkable group of scholars who have studied media production from a cultural perspective over the past 60 years. There is a voluminous literature about print and audiovisual newsrooms and documentary (Boyd-Barrett, 1995; Breed, 1955; Cottle, 2003; Gans, 1979; Ericson, Baranek, & Chan, 1989; Golding & Elliot, 1979; Jacobs, 2009; Riegert, 1998; Tracey, 1977; Tumber, 2000; Hannerz, 2004; Tuchman, 1978; Tunstall, 1971, 2001; *Worlds of Journalism*, 2006). Cinema and television have generated outstanding critical ethnographies, from the moment when Hortense Powdermaker (1950) bequeathed Hollywood the name of "the Dream Factory" through to John T. Caldwell's study of Hollywood's intersecting "production cultures" (2008). Media scholars have written about the proxemics and deictics of making horror movies, science fiction and documentary television, and soap opera. The most significant names are Edward Buscombe, Manuel Alvarado, Albert Moran, John Tulloch, and Todd Gitlin; but others have contributed a great deal as well (Abu-Lughod, 2005; Alvarado & Buscombe, 1978; Buscombe, 1976; Cantor, 1971; Dornfeld, 1998; Elliott, 1979; Espinosa, 1982; Ginsburg, Abu-Lughod, & Larkin, 2002; Gitlin, 1983; Goldsmith & O'Regan, 2005; Gregory, 2007; Moran, 1982; Ortner, 2007; Silverstone, 1985; Tulloch & Alvarado, 1983; Tulloch & Moran, 1986; Ytreberg, 2006).

Their principal focus has been on how meaning is encoded at the point of production and generally linked to the morphology of texts and their decoding at the time of reception. Production studies overlap with media, communication, and cultural studies more generally. Like mainstream textual analysis and audience studies, such research is trying to answer a riddle: Why do these texts matter – what makes them meaningful? If we revisit the venerable, stolid engineer's or quantitative surveyor's model of sender–message–receiver (SMR), we find coeval status accorded to all three points on the chain, in a pragmatic way that wants to understand the best way of getting a point across (Weaver & Shannon, 1963). The model offered by television studies goes further, specifying the people involved in the process and displacing the linearity of SMR with feedback loops that fold in on themselves to create “television's ‘hermeneutic circle’” (Michaels, 1990).

Production studies oscillate, depending on inclination, genre, and access, between the consciousness of this or that particular agent – from scriptwriters and journalists to members of the public. These forms of consciousness are inscribed in communications between writers and producers, business strategies, films, programs, ratings figures, and fan blogs. There is value in understanding how texts come to be, their contents, and what happens to them. But the idealism of privileging consciousness – of owners, producers, texts, and audiences – puts a fundamental limitation on production studies. As these theories seek to specify how production aims to create consciousness, they are drawn into a conceptual territory dominated by the media industries themselves.

At such moments we can understand Bart Beaty's comment that “media studies has found its objects of study seemingly dictated by *Entertainment Weekly*” (2009, p. 23). One of the pioneering figures in the cultural studies of media production, the late Manuel Alvarado, noted that, some decades ago, “producers did not want researchers and academics sniffing around their underbellies, uncovering and revealing their working practices (and maybe malpractices!).” Conversely, today “everyone in the media industries [. . .] wants to explain the significance of their role” (Alvarado, 2009, p. 309).

One way to check whether production research has been captured by the consciousness business is to ask whether it is governed by the criterion of economic growth, such that production is valued for amplifying pleasure and serving capital accumulation (box office, ratings, and so on). That approach is compromised, because it focuses on the consciousness of the actors who create growth. In such cases new technologies, new modes of media consumption, more screens, higher resolution, greater mobility, and promises of ubiquitous information, entertainment, and nostalgia streaming into pocket-sized devices appear as virtues. In this story of limitless growth, the principal goal of technology is to overcome scarcity by providing smaller, faster, and lighter media devices at ever lower prices to consumers.

The material origin and function of media technologies is easily forgotten in such digital abundance, overtaken as it is by the symbolic power of the technological sublime: the enchantment with the seeming magic of iPhones, flat-screen HDTVs, wireless communication, 3-D IMAX cinema, mobile computing, and so on. The

technological sublime relates to what Karl Marx called “the Fetishism which attaches itself to the products of labour” once they are in the hands of consumers, who lust after products as if they were “independent beings” (1987, p. 77). In everyday life, the sublime experience of electronic machinery conceals the fact that physical work and material resources went into their “being.” Mere mention of the political-economic arrangements that make shiny new things possible is rejected like bad medicine, an unwelcome buzz-kill of “cool stuff.” The technological sublime makes the idea that “more is better” palatable, axiomatic; even sexy. Such symbolic power underlies what Juliet Schor (2010, pp. 40–41) calls “the materiality paradox”: the greater the frenzy to buy goods for their transcendent or non-material cultural meaning, the greater the use of material resources.

A green political-economic approach to media production, predicated on regard for workers and for Earth, can disrupt the technological sublime. Marx often drew his readers to this ethical orientation through sarcasm and irony, as when he wrote that industrial progress was “progress in the art, not only of robbing the labourer, but of robbing the soil [. . .] ruining the lasting sources of that fertility.” Capitalist technology and associated social relations sap “the original sources of all wealth – the soil and the labourer” (Marx, 1987, p. 475). An unlikely ally, Heidegger, noted the paradox of the “forester who measures the felled timber in the woods and who to all appearances walks the forest path in the same way his grandfather did.” Heidegger recognized that, “whether he knows it or not,” the forester actually works for the culture industries; “subordinate to the orderability of cellulose,” he is “challenged forth by the need for paper, which is then delivered to newspapers and illustrated magazines” (Heidegger, 1977, p. 299).

There is ironic tension in the very pages you are reading, which have been printed by an industry that is responsible for deforestation and high levels of greenhouse gas emissions, on a par with mining and petroleum. Making paper poisons the environment with chemicals and their synthetic byproducts, including dioxin, the most dangerous human-made substance emitted through pollution. Print-shop working conditions also pose environmental risks to workers exposed to toxic smog, heavy metals, solvents, silver, film and paper dust, and wastewater (Environmental Protection Agency, 1995; Tripsas, 1997, pp. 124, 142).

One kind of labor is exalted in the technological sublime. Not surprisingly, it is well suited to propagating the ideology of growth. To 1960s anti-socialist ideologues like Zbigniew Brzezinski (1969) and Daniel Bell (1977), communications technologies promised the permanent removal of grubby manufacture from the First World and its mooring in the Third, provided that reactions to global business and the blandishments of socialism did not create class struggle and that the US continued its textual and technical dominance. Since the 1970s, “knowledge workers” have been recognized as vital to sustaining First World economies, thanks to information-based industries that promised endless gains in productivity and the purest of competitive markets (Bar, with Simard, 2006, p. 351). This is the “aristocracy of talent” (Kotkin, 2001, p. 22), which has attained pre-eminence through a discourse of progress, infor-

matization, and the “creative industries.” Its high priests proclaim an epoch of knowledge workers operating through techniques, technologies, and networks. This neoliberal clerisy has a presence even within cultural studies, via a New Right faction dedicated to a discourse of “creativity” (Flew & Cunningham, 2010; Keane, 2009; Mattelart, 2003, pp. 177–178, p. 43).

Labor is thus acknowledged within the technological sublime, but only when it is abstracted from physical, dirty work: on the left, Michael Hardt and Antonio Negri refer to “immaterial labor,” which exchanges information, knowledge, and emotion, filtered through computer invigilation (Hardt & Negri, 2000, pp. 286, 290–292). The futurist Alvin Toffler invented the related concept of “the cognitariat” (1983), which has since been taken up and redispersed by progressives. Negri (2007) uses it to describe people mired in contingent media work who have advanced educational qualifications and facility with cultural technologies and genres.

The cognitariat plays key roles in the production and circulation of goods and services, through both creation and coordination. They are media producers, to be sure: using media technologies, they add value to property, and they operate close to the means of creative production. But they comprise a category of laborers delimited by a narrowly defined consciousness industry:

- artists, comprising musicians, directors, writers, and journalists;
- artisans, including sound engineers, editors, cinematographers, and graphic designers;
- impresarios, who connect proprietors and executives to artists;
- proprietors and executives, who control employment and investment and negotiate with states; and
- audiences and consumers, who pay for content, interpret it in order to give media meaning, and elide real barriers of entry to media production through their dubious anointment as producers/consumers (prosumers).²

These groups operate within institutional contexts:

- private bureaucracies, which control investment, production, and distribution across the cultural/copyright industries;
- public bureaucracies, which offer what capitalism cannot, while comporting themselves in an ever more commercial manner;
- small businesses, run by charismatic individuals willing to take risks; and
- networks, that is, fluid associations formed to undertake specific projects.

Conventional production studies see the world of media labor confined to a small patch of creative industries in which the consciousness of industry mavens defines the reality of production practices, mirroring the growth ideology and the kind of apolitical enchantment with media technologies found in trade publications and entertainment news outlets. In contrast, a growing body of critical research into media labor is generating information from below the line of elite industry research;

and it does so by drawing on more diverse and independent sources, including labor unions and policy analysis (Blair, 2001; Chakravartty, 2007; Christopherson, 2006; Day, 2005; Deuze, 2007; Dex, Willis, Paterson, & Sheppard, 2000; Elmer & Gasher, 2005; Forum, 2010; Gall, 1998; McKercher, 2002; McKercher & Mosco, 2007; Miller, 1990a, 1990b; Miller, Govil, McMurria, & Maxwell, 2001; Miller, Govil, McMurria, Maxwell, & Wang, 2005; Mosco & McKercher, 2008; Neff, Wissinger, & Zukin, 2005; Ross, 2009; Rossiter, 2006; Sholle, 2005; Ursell, 2000).

By modifying production studies' fundamentals through an ecological and labor approach, we hope to see media, communication, and cultural studies leaven their fascination with growth with a focus on sustainability. This is by no means aberrant. Some extant research considers the physical nature of work and what it does to people and the environment; such are Luis Reygadas' (2002) account of how television sets are made, Jefferson Cowie's (2001) study of Radio Corporation of America's "seventy year quest for cheap labor," and Vicki Mayer's investigation of electronics assembly workers in Brazil (2011). At the same time there is a rich vein of cultural studies interacting with science and the environment, and some of it is articulated to the media (Acland, 2007; Berland, 2009; Nixon, 2000; Ross, 1995). The following section examines media production and the life cycle of media technologies from an ecological materialist perspective, using supply chain studies to provide a more comprehensive understanding of media production work.

Labor and Environment in Media Production

In the factory, I assemble five computer cards per minute. More than 3,000 cards in my 11-hour daily shift. But I have never used a computer myself, I don't know how to; what's more, I don't even know what the computers I make look like when finished.

(Unnamed Mexican worker; quoted in CEREAL, 2006, p. 6)

I work like a machine and my brain is rusted.

(19-year-old female worker from Guangxi at the Compeq printed circuit board factory in Huizhou City, China; quoted in Chan & Ho, 2008, p. 22)

Media production, information and communication technology (ICT), and consumer electronics (CE) are major sources of toxic waste, pollution, and labor injustice – this is their legacy and, for now, their future.

Consider the US motion picture industry. Its mass-produced raw film stock was derived from chemical processes for making cotton cellulose and silver nitrate emulsion. By 1926 Eastman Kodak was the second largest consumer of pure silver bullion, after the US Government Mint. Nitric acid baths extracted silver nitrate, and the cellulose film base came from cotton that was bleached and immersed in nitric acid and sulfuric acid, rinsed in water, and fed into mixers with solvents, so as to produce

a honey-like paste (Blair, 1926; Reilly, 1991; Twilight City, 1936). Eastman Kodak's raw-film plant at Kodak Park in Rochester, New York exposed workers to acids and acid vapors as well as to other irritants – including abnormal levels of silver and cotton dust, which inflamed their upper respiratory tracts and eyes and increased the risk of their contracting byssinosis or “brown lung” (Bowden & Tweedale, 2002; Dartmouth Toxic Metals Research Program, n.d.; Test-Tube Love Seat, 1940; Viscusi, 1985). From the 1920s on, Kodak Park was sucking more than 12 million gallons of water daily from Lake Ontario and spewing the used water, along with chemical effluents, into the Genesee River (Blair, 1926; George Eastman House, n.d.). By the end of the century, Kodak was using 35 to 53 million gallons of fresh water a day. It was the primary human source of pathogens released into New York State's environment (United States Department of the Interior, 2008).

Down the road from manufacturing, in 2006, the motion picture industry was the biggest polluter in Los Angeles. Its toxic emissions from driving, flying, exploding, and electrifying reached the same level as the aerospace and semi-conductor industries, while offshoring production further stimulated ecological despoliation. James Cameron's claims to global environmentalism, for example, may be welcome, but they are insufficient to make up for the horrendous impact of *Titanic* (1997) in Mexico, while Leonardo DiCaprio's credentials as a green spokesperson should be revoked in the light of how *The Beach* (2000, directed by Danny Boyle) destroyed Thai habitats (Corbett & Turco, 2006; Maxwell & Miller, 2009; Miller et al., 2005).

Likewise, before ICT and CE begin their life cycles as finished goods brought to market by Original Equipment Manufacturers (OEMs) – the major brands like Apple, Dell, Hewlett Packard (HP), IBM, Kodak, Sony, and so on – they must be assembled piece by piece, along a supply chain that stretches from the mines that supply the metals to the foundries and factories making parts, and on to final assembly and packaging. There is no point along the supply chain where the environment and workers are safe from harm. For example the semi-conductor – the heart of all electronic equipment – is produced by hundreds of companies around the world for a market dominated by Intel, Samsung Electronics, Toshiba Electronics, Texas Instruments, Qualcomm, ADM, and other major brand component suppliers. Its production requires millions of kilowatt hours of electrical power, half a trillion gallons of de-ionized water, hundreds of millions of cubic feet of bulk gases (much of it poisonous), and millions of pounds of acids and solvents exposing workers to dangerous toxins and carcinogenic chemicals (Silicon Valley Toxics Coalition, n.d.).

By the time the finished electronic products reach above-the-line producers and consumers, evidence of the supply chain's toxic history has disappeared into the technological sublime – the devices appear as environmentally benign, postindustrial wonders. Also invisible is the radiation emitted from televisions, computers, electronic games, computer monitors, cell phones, laptops, networks of telecommunication and electrical towers, and power lines (Brigden, Santillo, & Johnston, 2008; Environmental Working Group, 2009; Lean, 2008). Human-made electromagnetic fields (EMFs), the basis of electronic media, spread radiation that has “no counterpart

in man's evolutionary background" (Massey, 1979, p. 149). The electromagnetic spectrum is comprised of ionizing radiation (ultraviolet rays, X-rays, and gamma-rays) and non-ionizing radiation (extra-low and very low frequencies (electrical power lines), radio waves, and microwaves). Non-ionizing radiation occurs at the atomic level when energy excites electrons and molecules without knocking the electrons loose, as ionizing radiation does (*ibid.*, pp. 109–111). By 1980, research into this topic led to policies that set parameters for human exposure to these forces; those parameters included the energy level of signal generation, proximity to signal source, radio wave frequency resonance with affected bodies (EMF absorption rates vary among species, sizes, and ages), pulsed versus continuous wave forms, and duration. Transmission towers and signal generators (and some consumer electronics) pose biothermal risks to media workers continuously exposed to radio, TV, and telecommunication equipment, as well as to office workers on the top floors of buildings within the range of high-power transmission antennae (*ibid.*, pp. 121–125; National Research Council, 2005, 133–137).

When these media technologies are thrown out at the end of their life cycles, the resulting electronic waste (e-waste) generates serious health and safety risks: bone disease, brain damage, headaches, vertigo, nausea, birth defects, diseases of the stomach, lungs, and vital organs, disrupted biological development in children. These conditions result from exposure to heavy metals (lead, cadmium, and mercury among others) and toxic fumes emitted when burning e-waste (Leung et al., 2008; Ray, Mukherjee, Roychowdhury, & Lahiri, 2004; Wong et al., 2007).

It is important to note that the ecological problem of media technologies is not just "one for the scientists." As research on environmental harms caused by media technology emerged between 1980 and 2000, membership in environmental groups worldwide more than doubled. Activists, public health advocates, workers, and policymakers publicized the impact of the electronics, electrical, and energy industries in Silicon Valley and elsewhere (Byster & Smith, 2006, p. 109; Dalton, 2005, pp. 453–454; Maxwell & Miller, 2009). Bodies such as the International Labor Organization (ILO) and the International Organization for Standardization asked for greater transparency and uniformity in the way ICT and CE corporations do business – and so have international legal agreements to reduce the toxic content of electric and electronic goods, for example the 2003 European Union's Waste Electrical and Electronic Equipment Directive (WEEE) and the 2003 Directive on the Restriction on the Use of Certain Hazardous Substances in Electrical and Electronic Equipment. OEMs were forced to confront environmental problems in production and to devise internal codes of conduct that met ILO guidelines for worker safety (RoHS).

With the exception of Sony, which commenced environmental audits in 1994, the major companies only began to consider ecological impacts in the 2000s (van Liemt, 2007). To minimize state regulation and to gain green credibility with the public in First World countries, OEMs adopted a strain of public relations pioneered in the 1990s by textile and footwear industries in order to address labor exploitation and environmental damage. Corporate Social Responsibility (CSR) became a watchword

as OEMs began to audit working conditions across their global supply chains and to disclose their findings and remediation efforts.

OEMs are the lords of the electronics supply chain; they control intellectual property, technological research, design, and marketing. Below them are the extractive industries, small-scale cottage assemblers, and contract manufacturers. The latter have grown massively since the 1990s, with about 75% of global electronics manufacturing and 60% of cell phone production outsourced to them by OEMs (GoodElectronics, Overeem, & CSR Platform, 2009, pp. 19–20). Five major contractors control this section of the chain:

- Foxconn Technology (Hon Hai Precision) of Taiwan: Apple, Dell, Hewlett-Packard (HP), Sony, Amazon Kindle;
- Flextronics of Singapore: Cisco, Kodak, Ericsson, HP, Microsoft, Motorola;
- Jabil of the US: Cisco, Philips, HP;
- Celestica of Canada: Motorola, Palm, Research in Motion, Sun Microsystems, HP;
- Sanmina-SCI of the US: Cisco.

These multinational ICT corporations operate factories in scores of countries, employing tens of millions of workers – a structural arrangement that emerged in the late 1970s, when big ICT and CE firms set about departing First World factories for the sweatshops of developing countries, in accordance with the New International Division of Labor (NIDL) (Fröbel, Heinrichs, & Kreye, 1980).³ While it is common to find environmental and labor codes within these companies' corporate communications, the pressure for them to adhere to safety guidelines has come largely from OEMs' implementation of supplier responsibility audits. In 2004 Dell, HP, IBM, and the contract manufacturers Flextronics, Solectron (bought by Flextronics in 2007), Sanmina-SCI, Celestica, and Jabil developed an Electronic Industry Code of Conduct, which set benchmarks giving watchdog groups like Students and Scholars Against Corporate Misbehavior (SACOM) tough standards by which to judge OEMs like HP (high marks) and Apple (low) (van Liemt, 2007, p. 15).

The main trade groups representing the OEMs are the Electronic Industry Citizenship Coalition (EICC) and the Global e-Sustainability Initiative (GeSI). The EICC and GeSI have begun supply chain audits of labor and environmental conditions in the extractive industries. Metals used in electronics (tin, cobalt, palladium, gold, copper, silver, and aluminum) are extracted from mines (and obtained from recycling). They then travel the supply chain via buyers, brokers, and refiners. In 2008 the annual proportion of the global metal supply going into ICT and CE was 36% of all tin, 25% of cobalt, 15% of palladium, 15% silver, 9% of gold, 2% of copper, and 1% of aluminum (GeSI & EICC, 2008, pp. iii, 24–26, 34–36; Grossman, 2006, pp. 29–33). Roughly 11 million people work in the formal mining sector, which operates about 4,100 major mining companies (of which the top 150 control 80% of the global output). Tracking the number of workers in the metals supply chain is complicated

by a globally diffuse informal sector – artisanal and small-scale mining (ASM), a notoriously harsh, low-tech, poverty-driven form of mining – and by a large population of workers whose jobs depend on it (porters, buyers/transporters, smugglers, exporters, and so on). The ILO (2010) estimates that, while there are about 13 million workers in ASM worldwide, the total number of workers involved is 200 million.

Virtually all ASM is concentrated in Africa, Asia, and Latin America, where about a million children labor in mines (GeSI & EICC, 2008, p. 56). In the eastern Democratic Republic of Congo, over 90% of mines are controlled by militias, who use threats, intimidation, murder, rape, and mutilation to enslave women and children, then extract profits to buy more weapons. This supply of “conflict metals”/“conflict minerals” is mixed with the rest of the global supply and sold on the international commodities market before ending up in phones, computers, games, and media production equipment (Global Witness, 2009). In terms of the environmental impact, over a quarter of the world’s active mines “overlap with or are within a 10-kilometer radius of a strictly protected area”; one third is “within areas of intact ecosystems of high conservation value”; one third “in stressed watersheds”; one fifth in earthquake prone areas; and more than a third “in areas that may be predisposed to water quality problems” (Miranda et al., 2003, p. viii). This does not take into account the chemical waste and toxic effluents associated with refining.

The current proliferation of CSR strategies that use supply chain audits has opened up a critical juncture, exposing new information about ICT and CE supply chains. While not completely transparent, the new audits make OEMs more vulnerable to ecologically informed and critical production studies, if we undertake them (though there’s no telling how long today’s environmental *perestroika* will last). Still, there is no uniform pattern to these audits in media production, because film and TV producers and distributors have patchier CSR strategies for environmental reviews – by now we hope it is clear that media production must include ICT, CE, and film and TV manufacturing and studio “creativity” (van Liemt, 2007). And, with labor geographically so dispersed via international subcontracting, union density is “startlingly low around the world,” which makes it difficult to gather reliable information on working conditions and labor practices (Ferus-Comelo, 2008, p. 141). This might explain why existing audits have been unsuccessful in reaching the part of the supply chain where thousands of labor-intensive component makers provide contractors with resisters, capacitors, cables, switches, microchips, unfinished circuit boards, wires, connectors, power supplies, clips, screws, and so on. Part of this activity is internalized within large factories where it can be monitored, but a significant amount of work takes place in people’s homes (GoodElectronics et al., 2009, p. 51).

Studies of the supply chain must also take into account e-waste, respecting methods developed by environmental science, public health, and engineering scholars, policy-makers, and activists. An increasing number of firms address the problems of reuse and recycling of old or discarded electronics, while the EU’s WEEE Directive and efforts to enlist manufacturers in recycling have brought greater pressure on OEMs to take responsibility for their products’ afterlife. Until that happens, global working

conditions in the informal salvage and recycling sector will remain marginal to CSR audits, and millions of workers who labor in the global salvage business will be ignored.

These inconsistencies in OEM audits are coupled with a lack of sociological and historical understanding of the socioeconomic changes that have accompanied the rapid growth of contract manufacturing in Asia and elsewhere. The internal audits give us the names of Dell's and HP's suppliers, for example, but they don't tell us that Apple petitioned the US Federal Communications Commission to hide governmental review of the iPad, which would have disclosed to the public the way in which it exploits multinational labor (see Federal Communications Commission, n.d., for Apple's letter to the Commission's inquiry, BCG-E2381A). Meanwhile, investigations into its Chinese suppliers have shown that Apple uses children to assemble its gadgets and that it is unresponsive to the chemical poisoning of workers at Wintek (an iPhone supplier) and to the searing conditions behind numerous suicides at a Foxconn factory that makes iPhones and the first iPads (Barboza, 2010; Chan, 2010; Moore, 2010a, 2010b). The suicides should be of particular concern for media production researchers, because they point to an ongoing clash between the twenty-first-century means of producing media technology and the mass mobilization of rural Chinese youth to work in these factories (the largest migration in history, by some measures). These stresses of factory life are symptomatic of contemporary industrial organization: we know that post-Fordist factory systems are geared to meet OEMs' demand for rapid design innovation and ever shorter cycles of new product roll-outs through just-in-time production. But there is also an ethico-political dimension to the way Chinese contract manufacturers implement this system: these young people are removed from virtually all the social resources that would help them adjust to their sequestration in high-tech, high-speed, high-security compounds – that is, resources like family, friendship, freedom of association (they can't even talk to one another on the assembly line), or forms of cultural enjoyment and release.

Workers losing their lives to meet production deadlines has been part of communication technology's history, from railways to integrated circuits. What's new here is that a vast population of young workers has been thrust into a low-cost, high-velocity factory system whose output is increasingly driven by First World hyper-consumerism, with its manufactured desires for fast-changing fashions promoted by advertising and marketing. Apple's pressure on suppliers is not only an end-run to beat competitors to market, but also an incitement to the frenzied pursuit of the symbolic power of *the device* and its promises of instant gratification via the technological sublime.

Production studies must play a part in exposing these unsustainable systemic tensions in the ICT and CE supply chains, perhaps taking inspiration from a new generation of Chinese workers, who have begun to push back against OEMs through strikes and other forms of resistance, including by using mobile devices to document and publicize the inhumane working conditions at Foxconn and other contract manufacturers (Barboza & Bradsher, 2010, p. B1).

The example of such activists impels us to conduct studies of the total life of the commodity sign, from its manufacture to its decline, and of all the people who bring it to us and then remove it when we've grown bored with it or it breaks. Before we consider other ways in which production studies can train its focus on these issues, the following section provides a closer look at a key site of media production work in the global assembly line.

The Case of *las maquiladoras*

The National Coalition of Electronic Industry Workers declares that, five years after the publication of the Electronic Industry Code of Conduct, the same companies that signed the Code are the ones violating the human labor rights.

The Code states (part A-7) that the signing companies should respect the workers' freedom of association. This right, in our Federal Labor Law, is constantly violated. We recall two recent cases. The first one: the dismissal of more than 10 workers of Flextronics, only because they demanded transparency on the issue of profit shares.

The second case was the dismissal of Aureliano Rosas Suárez, Omar Manuel Montes Estrada, and Vicente de Jesús Rodríguez Roa, sacked because they demanded their right to have their wages leveled. They also worked for the company Flextronics.

We inform the International Electronic Industry that the members of the National Coalition of Electronic Industry Workers will continue to use this mask as a symbol of our repression. But the coalition will continue demanding and defending our human labor rights.

(National Coalition of Electronic Industry Workers; quoted in Centre for Reflection and Action on Labour Issues, 2009, p. 28)

This quotation comes from a group of Mexican workers in electronics. They stage protests in white masks for the media and around the employment agencies that govern casualized labor in assembly plants. The coalition stands up to this political economy. It is the solitary civil society voice that is organic to workers on the line (and to those who have been dismissed). The official trade unions that address working conditions in Mexican ICT and CE plants are neither representative of workers nor interested in worker grievances. Instead they help manufacturers bypass laws covering contract negotiations, and they prevent labor from forming independent unions. As CEREAL put it: "90% of workers belong to a trade union; but 90% of those do not know it" (2006, p. 15).

Mexican *maquiladoras* opened their doors in the mid-1960s, when the *bracero* ("strong-arm") guest worker program between Mexico and the US was terminated. The Mexican state introduced import tax exemptions to stimulate in-bond input assembly,⁴ and Washington permitted the duty-free return of assembled components that had originated north of the border. What began as a temporary initiative

attained massive economic significance during the 1980s and 1990s, when electronics became a core industry. The industry's warehouses, managers, and researchers are generally based in San Diego. Components are imported from there – and also from Germany, Korea, Japan, Taiwan, Malaysia, and Thailand. So “high value” is created in the US and elsewhere; dangerous, dull, and poorly remunerated work is done across the border. Tijuana was dubbed “TV Capital of the World,” because so many sets were assembled there. In 2002 Mexico accounted for 30.42% of television set and video equipment exports to the US, and China for 18.5%. But competition arose due to tax incentives and to low-wage and energy costs in China, Thailand, Malaysia, and Vietnam. By 2006 Mexico's and China's percentages were virtually equal (35.07% compared to 34.76%). *Maquiladora* employment fell each year, from 2000 to 2003. The global recession, evident by 2008, slashed employment and investment. The nearly 200 companies that assembled ICT and CE in Mexico decreased production by almost 40% from the middle of that year: Sony announced the closure of a TV plant in 2009, with the loss of 600 positions. The *maquiladora* slide slowed later that year, because firms looked to cut the time wasted exporting parts and importing sets across the Pacific. Production was boosted and job growth accompanied it, but not at pre-recession levels. In all, 144 plants closed in the 12 months leading up to October 2009, and 122 new ones opened (see Castañeda, in this volume; Centre for Reflection and Action on Labour Issues, 2009; Gaffney, 2010; García & Simpson, 2006; Mendoza, 2010; NOTIMEX, 2010).

It is not as though labor costs were high in the *maquiladoras*: wages consistently declined from 1993 to 2006, while productivity increased. Two full-time workers in a Mexican plant receive just two thirds of the wages needed to support a family of four, prior to medical and educational expenses. Not surprisingly, the people who make these gadgets can't afford to purchase them. Because a flat-screen TV sold in San Diego is exempt from customs duty, it costs less there than where it was made, across the border in Tijuana (Where Is “Away?” 2009). The key instrument of exploitation has been the North Atlantic Free Trade Agreement/Él Tratado de Libre Comercio, because, despite technically including environmental and labor protections, the Agreement/Tratado ushered in low wages, violations of the labor law, and exposure to unhealthy chemicals and gases – a toxic life in every sense (Simpson, 2007, pp. 166–167).

The 1983 La Paz agreement between Mexico and the US mandates that *maquiladora* waste return to its country of origin; but enforcement has been lax, and statistics about the flow of contaminated goods and the environmental side-effects of production are spotty. Civil society groups on both sides of the border, notably Las Voces de la Maquila (<http://www.lasvoces.org>), the Colectivo Chilpancingo Pro Justicia Ambiental and the Environmental Health Coalition (see both at <http://www.environmentalhealth.org>), remind authorities of their responsibilities and encourage citizen activism (García & Simpson, 2006; Simpson, 2007). Greenpeace (n.d.) is also involved.

Women have long been at the forefront of the *maquiladora* electronic labor process. For instance, when RCA moved its radio and TV plants from New Jersey to Indiana

and then to Ciudad Juarez in Mexico, in search for ever cheaper labor, company elders sought a workforce of young unmarried women. This strategy had little to do with biological kinesiology (in other words, with the docile, nimble-fingered girls found in managerial playbooks); it was rather about gender and power (Cowie, 2001, pp. 17–18; Maxwell & Miller, 2008). The Centre for Reflection and Action on Labour Issues (2009) interviewed thousands of workers in 2008 and 2009 across the Mexican electronics sector, disclosing systematic sexual harassment and other forms of discrimination. Employees are often subjected to invasive interviews, body searches, and pregnancy tests; illegally excessive working time is common and uncompensated; women are sexually harassed; contracts are non-existent or highly precarious temporary agreements; some managers use psychological violence; workers are exposed to dangerous chemicals and fumes, having little or no training about the hazards or proper protection from them; and the freedom to form independent unions or other organizations is absent. Despite the fact that, in factories, each woman prepares more than a hundred central processing units per an hour, women are categorized as “temporary” employees, so employers can elude regulations and contracts that govern full-time workers (Paterson, 2010; van Liemt, 2007, pp. 12–14).⁵

Conclusion: Creative Production Is Theft

Remaining non-union is essential for survival for most of our companies. If we had the work rules that unionised companies have, we'd all go out of business.

(Robert Noyce, co-founder of Intel; quoted in Catholic Agency for Overseas Development [CAFOD], 2004, p. 3)

I was three months pregnant. I told them when I was one month pregnant; I asked my facilitator to move me, but she said no, not until they have found someone else. I worked from 3.30 to 12 p.m. On 17 November 2005, when I arrived at work, I started to feel unwell. I went to the lavatory and noticed I was bleeding. I went straight to the infirmary and the doctor told me it was nothing, that it was normal. I went back to the production line and told my supervisor I was feeling quite sick, and asked him for permission to leave. He talked with the doctor over the phone and then told me “I’m not letting you out, don’t be a wimp . . .” [T]he baby wasn’t growing properly. [The doctors] told me it was because of the lead, and I believe that; that’s why I wanted to be moved when I found out I was pregnant, but I wasn’t allowed . . . I lost my baby . . . I got very depressed and spent all those days crying. I was only given two days sick leave.

(Rosa, 21, ICT production worker for contract manufacturer Jabil, Chihuahua, Mexico; quoted in CEREAL, 2006, p. 23)

There are [. . .] plenty of girls with good eyes and strong hands. If we run out of people, we just go deeper into China.

(Manager of Chinese electronics factory; quoted in CAFOD, 2004, p. 31)

Foxconn's suicides are a reminder of the human cost that can come with the low-cost manufacturing US tech companies demand.

(*Bloomberg Businessweek*; quoted in Wong, Liu, & Culpan, 2010, p. 36)

Despite the evidence, conventional economic models persistently omit the environmental and human costs incurred by toxic chemicals, fossil-fuel energy consumption, plastics, pollution, and other harms that inhabit the supply chain and life cycles of media and communication technologies. Environmental and human “expenses” remain “off the books” when net revenues are tallied up to measure growth in media and technology markets, adding to the illusion that these sectors are ecologically benign drivers of economic expansion. Were we to consider ecological and human liabilities as vital financial information, then accounting in the media and communication sector would reveal “fictitious incomes and real costs that haven’t been reckoned with yet,” demonstrating the need for sustainability and for regulated limits to growth (Schor, 2010, p. 18).

We have argued that, while the focus on consciousness and work in production studies generates worthwhile research at a particular level, the result is fundamentally indistinguishable from that of the ordinary science of media, communication, and cultural studies, and it makes production studies susceptible to industry self-analysis/interest. Too often, we recycle a pro-growth ideology because we are dazzled by the aura surrounding media technologies and creative occupations – the so-called aristocracy of talent, which comprises the recognized ensemble of workers in production practices. Our aim here has been to throw some shade over that dazzle and to look instead at neglected labor through a more materialist, ecological understanding of the physical environment in which production takes place. Media production studies can help to establish a just system of environmental accounting that shows how and where creative production steals from the Earth and from the working people in the name of growth. We’ll conclude with some observations on where future research is needed.

Given the scope and scale of media-related occupations across global networks, media production researchers face many challenges in studying labor and the environment. One difficulty concerns the definition of who counts as a media production worker. We have argued that conventional production studies have circumscribed this sector too narrowly and that more comprehensive research on media production labor is needed. As we have shown, before a director says “action” or an editor enters data that shape a narrative, a thousand assembly lines from all over the world have streamed into production vectors. By some estimates, there are nearly 200 million ICT workers, including professionals, software and services, assembly workers, and jobs that are enabled by the skilled use of information technology (Raina, 2007, pp. 18–25). Future research must be increasingly comprehensive, so the field of production studies needs to adapt and to design quantitative methods to help identify organizational relationships, geographical bonds, and interlocking occupations in media production supply chains, which currently link computer scientists, engineers,

designers, marketing researchers, miners, mineral brokers, refiners, chemists, factory laborers, server-warehouse employees, telecommunications workers, truck drivers, salespeople, office clerks, and anyone whose job has been “informationalized” with ICT tools, or who has contributed innovation, time, blood, or sweat to the making, distribution, and reception of a media device or text.

Another difficulty arises when we try to look beyond settled patterns in the NDIL to discern new formations in the structure of global labor at different sites around the world. For instance, the late twentieth-century pattern that set poor regions to make the “low-value” constellation of pieces and parts of a device and the richer regions to produce “high-value” research and development remains largely intact; but the rapid pace and expansion of outsourcing is making stark distinctions of this kind increasingly unreliable as guides for present-day production research (Bottini, Ernst, & Luebker, 2007). By 2004, 35% of ICT and CE manufacturing jobs were in China (as compared to 7% in the US, 9% in Japan, and 10% in Western Europe). As the case of the *maquiladoras* shows, the trend suggests further concentration in Asia, at the expense of jobs in competing countries like Mexico, which was once a standard site for outsourcing low-wage ICT and CE manufacturing (Carrillo, 2009, p. 14; van Liemt, 2007, p. 8). Production studies must continue to track these macrolevel changes in the international division of labor and to be alert to their effects on ecosystems and on workers’ lives.

Finally, low levels of unionization in the global supply chain have severely hampered research on the working conditions and environmental hazards associated with media/film, ICT, and CE production. Without widespread union representation and improvement in the exercise of associational rights, production workers lack independent institutional sources of information – a situation that is “casting doubts on the prospects of raising labor standards through [CSR] codes of conduct alone” (Ferus-Comelo, 2008, p. 157; Centre for Reflection and Action on Labour Issues, 2009). As long as political-economic arrangements militate against free unionization, it will be difficult to find reliable and representative statistical analyses of workers’ exposure to toxic materials and of other workplace hazards. To meet this challenge, media production studies must do more to internationalize its fieldwork and research methodology, placing researchers and doctoral students on the ground in the global supply chain. In the meantime, research will rely on a patchwork of non-governmental organizations, local activists, policy-oriented journalists, and CSR audits. Reports made by SACOM (Chan & Ho, 2008), by the Catholic Agency for Overseas Development (CAFOD, 2004) and by the Centro de Reflexión y Acción Laboral (CEREAL, 2006; Centre for Reflection and Action on Labour Issues, 2009), for example, have provided instructive accounts of the conditions in Chinese and Mexican plants (see also Nautilus Institute, Natural Heritage Institute, & Human Rights Advocates, 2002). As we have seen, such sources depict a system with weak labor protection, which is dependent on poverty-driven, gendered, immigrant labor. The majority of workers are young, single, female migrants aged between 16 and 25, laboring in factories for seven days a week and for 16 hours a day, in compulsory

residency, in sequestration from friends and family, and with no social freedoms. Some are fired at 21, when they attain their majority. Men are often not hired because they are seen as potentially militant (Chan & Ho, 2008, p. 8).⁶

This is a sobering corrective to celebrations of media “freedom.” So, as we track the lives of commodity signs that fascinate us, we need to forgo the comfort of the consciousness paradigm, striving instead for a more complex and nuanced approach, which is as broad-minded and expansive as the work of the activists, corporations, unions, and scientists who study labor and environmental processes. That means forming teams with environmental scientists and labor sociologists; reading environmental audits; and learning technical languages – in short, being as nimble as an activist or policymaker is.

We are confident that the methods and ethics of media, communication, and cultural studies can contribute to a more just and sustainable world, if agile media production analysts are prepared to go back, back, back – like a similarly agile baseball or cricket outfielder or football goalkeeper – to control the signs they love.

NOTES

- 1 Several terms and phrases are used to describe the media industries and their analysis, all of which connect to the notion of consciousness. They include “creative industries” (used by industry policy and the New Right of cultural studies); “culture” or “cultural industries” (used by the left and by some policymakers); and “copyright industries” (favored by US capital and its allies and handservants).
- 2 For a useful account of the prosumer, a preferred concept of cultural studies’ New Right, see Ritzer and Jurgenson (2010).
- 3 We have seen this tendency in film-and-television production as well (Miller, Govil, McMurria, & Maxwell, 2001; Miller, Govil, McMurria, Maxwell, & Wang, 2005).
- 4 In-bond (or *maquila*) assembly refers to the requirement that *maquiladoras* post a bond equivalent to the value of the imported, duty-free components. This is done to force the factory to export all finished products containing the imported inputs, at which point the bond is returned.
- 5 For an explanation of this conduct as systematic and built into the architecture of certain sites rather than as individual conduct, see Salzinger (1997, 2000). This research is from an earlier time, when these practices may have been less common.
- 6 One of us spent time with Chinese factory workers during the only afternoon a week when they were allowed to move beyond factory walls.

Understanding Hypercommercialized Media Texts

Matthew P. McAllister and Alexandra Nutter Smith

ABSTRACT

This chapter reviews critical-cultural media studies work on “hypercommercialized” media texts and offers an analysis of such a text. Given the incentives for commercial and promotional messages to grab the attention of consumers and integrate into their lives, we are seeing a variety of hybrid commercial forms in media. Product placement/integration, branded entertainment, sponsorship, cross-promotion, and other hypercommercial texts appear in different media and contexts. This chapter examines reasons for the prominence of these hybrid forms, and integrates previous research to explicate their textual dynamics and cultural implications as well as theoretical concepts that can be useful in interrogating them. The NBC comedy *30 Rock* is used to illustrate how different commercial contexts influence the meaning of a hypercommercial text. A discussion of how increased interactivity and target marketing further complicate the study of hypercommercial texts concludes the chapter.

Filmmaker Morgan Spurlock, in his satirical 2011 documentary *Pom Wonderful Presents The Greatest Movie Ever Sold*, asks Ralph Nader, “Where should I be able to go where I don’t see one bit of advertising?” Nader’s response is, “To sleep.” As this exchange signals, the “millennial era” may be someday known as the “hypercommercialized era.” Commercial and promotional intrusion is found in several venues, including

politics, education, and medicine (Aronczyk & Powers, 2010). As Spurlock self-reflexively explores, one especially key location is in media content. Media texts not designated as “advertising” have become increasingly invaded by advertising messages and branded icons. Since 2000, in the United States we have seen such commercially and promotionally oriented phenomena as:

- *Madden Nation*, a television program on the cable television network ESPN that debuted in 2005. Jointly created by ESPN and the videogame company EA Sports, the program featured expert players of the Madden NFL videogame squaring off against each other for the right to be crowned champion of that particular game each season. When aired on ESPN, *Madden Nation* – a giant commercial for the videogame – also featured ads for other products and promotions for other shows, most demographically targeted for the young, sports-oriented male.
- *Lucky* magazine, a hybrid of a magazine and shopping catalog with different textual features that blur the commercial, the editorial, and the promotional. Debuting in 2000, *Lucky* is seen as a significant brand-friendly success for the embattled magazine industry. As the editor of *Lucky* beamed, “everything in *Lucky* has got to be worth explaining to your friend why she should buy it” (quoted in McNamara, 2011, n.p.).
- The use of “long-form” ads like BMW’s *The Hire*. A 2001 series of five-minute-long “webisodes,” *The Hire* used the talents of such directors as Guy Richie and Ang Lee to tout BMW’s maneuverability in these half films/half ads. Available for a time on BMW’s website, teaser television commercials for the webisodes – ads for ads – aired on television in early 2001 (Owczarski, 2007). DVDs of the ad-based webisodes may be purchased on Amazon, which also includes DVD extras like two “making of” features about the campaign.

Although these examples are all from post-2000, they illustrate trends that began at least in the mid-1980s toward a “hypercommercialization” of culture (McChesney, 1999). Certainly the presence of intrusive advertising is nothing new, but the particular modern versions, the reasons for them, and their implications in our current cultural context have attracted a large amount of scholarship and triggered some rethinking of assumptions about the relationship of advertising to media content. Much of the scholarship examining hypercommercialism focuses on the United States, which is also largely the focus of this chapter, but this is a global phenomenon that likewise has its roots in the 1980s (Frith & Mueller, 2010; Mattelart, 1991).

Hypercommercialism often involves the blurring of commercial assumptions and messages into different cultural forms. It can involve the relatively superficial, such as product placement: inserting brands into the background of a scene or the casual use of a brand by a character in a movie or television program (Galician, 2004). More intense versions include product integration, where a brand becomes part of a plot for a movie or a TV episode, and branded entertainment, where a brand becomes the premise for some sort of entertainment (Lehu, 2007), such as *Madden Nation*.

Hypercommercialism has invented new hybrid forms, often signaled by mutated words like infomercial, advertorial, advertainment, and advergaming. As Mattelart observed early in this cultural trend, such hybridity removes distinctions “between news and commercials, advertising and editorial, publicity and journalism, publicity and reportage, between promotional surface and editorial content, advertising and the programme” (1991, p. 130). It also involves the mixing of different textual types together in a way that may integrate a larger flow of commercial and promotional messages. As will be reviewed, the nature of hypercommercial texts has implications for culture and democracy.

The majority of research on hypercommercial techniques such as product placement and sponsorship is conducted from a business-oriented point of view: do these techniques sell, and how can we make them more effective? But a significant amount of scholarship from a critical and cultural perspective focuses on the ideological and cultural dynamics of these texts, including the effect of hypercommercialism on artistic autonomy, cultural space, democracy, diversity, and critical thinking. Given their hybrid nature and the different contexts in which they may appear, studying modern hypercommercial texts is especially challenging.

This chapter will explore some of these trends, the reasons why we see them now, the research that has attempted to understand these developments, and contextual complications that can arise in critiquing hypercommercialism. The chapter will end with a discussion of the future of hypercommercial trends, including likely forthcoming variants and points of resistance.

Precedents and Context

McChesney specifically labeled our modern times as the “age of hypercommercialism” (1999, 2004) and a “commercial tidal wave” (McChesney & Foster, 2003). Others have talked about “the commercialization of culture” (McAllister, 1996), the “web of brands” (Klein, 1999), advertising “clutter” (Goldman & Papson, 1996), “the dangerous spread of commercialized culture” and “ad creep” (Ruskin & Schor, 2005; Bettig & Hall, 2012). Such work focuses on both the wide *breadth* of advertising and corporate promotional visibility throughout different sectors of society and culture, and the imposing *depth* of control over media content and culture by advertising forces.

Earlier eras have also seen very visible and pervasive forms of advertising, shaped by particular economic and technological dynamics. Raymond Williams (1980) argued that observers of many different eras have been so distraught with the presence of commercial messages that they often declared that it could not possibly get any worse. (The authors of this chapter, on the other hand, will argue at the end that it absolutely can get worse.) The streets of mid- and late nineteenth-century London were filled with flyers, posters, placards, and walking sandwich boards, while newspapers became more receptive to advertising placement. At about the same time

in the United States, national magazines and newspapers began to generate the majority of their revenue from advertisers, thereby shaping content to be complementary to the advertising messages (Andersen, 1995; Baker, 1994; Ohmann, 1996).

A commercial surge in the United States also occurred between the 1930s and the 1950s, as a sponsorship model of funding was applied to radio and television. In such cases, one broadcast program would be funded by, and exclusively promote, one brand. Advertising agencies representing these brands produced programs for the broadcasting networks, facilitating the infiltration of programs with the sponsoring brands and using program hosts and actors to pitch brands during the commercial breaks (Cross, 2000; Samuel, 2001).

A case can be made that we have entered a new era of hypercommercialism with its own unique contextual forces and characteristics. Digital technologies since the 1990s have had complex effects upon the nature and degree of commercialism in society. Certainly, older technologies such as the remote controls and VCRs in the 1980s introduced the idea of “viewer control” over when or even if viewers had to watch the commercials. However, digital viewing technologies like the DVR accelerated this anxiety for many advertisers (Carlson, 2006). These technologies combined with theoretical “ad-free” televisual spaces such as premium cable networks, on-demand movie services, and videogame consoles that frustrated advertisers from reaching prime demographics. As a result, advertisers became more aggressive in blurring the line between advertising and programming (i.e., product placement), making it more difficult to avoid ads and demanding that media creators cede control to commercial interests.

The effect of the Internet upon advertising and promotional practices has been and will continue to be enormous (Spurgeon, 2008). Its layout protocols and multimedia modalities encourage the blending of different content categories, including commercial forms with noncommercial forms. It creates additional and enduring commercial spaces, such as websites devoted to promotion and branding and the archiving of television and print commercials that previously had a limited shelf life. Given that it costs no more to link a 10-minute-long video than a 5-second-long video to a site, longer promotional forms are viable on the web, including hybrid promotional forms such as “advergaming” and “webisodes.”

The Internet also pressures traditional media to be more advertising receptive. The redirection of advertising dollars to the Internet means that newspapers and television are increasingly desperate to retain advertisers – and therefore more likely to give advertisers increased influence over content decisions. The Internet easily matches specific ads with specific content or user behavior such as search terms and previous web uses: banner ads for travel services next to web stories, search results about travel, or suggestions about future purchasing based upon purchase history. A similar commercial innovation is the development of behavioral measurements of advertising effectiveness for the Internet – such as “click-through” aggregates that indicate how many web users have not only seen a banner ad on a website, but actually acted upon it.

Other media developments encourage the hypercommercialization of culture. Modern media corporations both distribute advertising for other companies and have their own brands to sell. Scholars analyzed the media's own "promotional culture" (Wernick, 1991) and cross-media synergy (Meehan, 1991) well before digital forms were introduced. But the monetization of media products facilitated by digital media – selling film and TV programs as DVDs and through e-commerce sites such as iTunes – further emphasizes media promotion. Corporations leverage their licensed brands in various revenue-generating forms and in publicity-generating forms such as magazine covers, behind-the-scenes features, and cross-promotions with fast-food companies and other marketing partners (Gray, 2010; McAllister, 2000). Because a corporation like Disney depends on both advertising revenue through its subsidiaries like ESPN and ABC and direct-sales revenue, such corporations are constantly searching for corporate partners who aggressively mix advertising buying with cross-promotion for media licensing. Such deals often include inserting promotional messages in movies and television programs.

Changes in the advertising industry also facilitate hypercommercialization. The growth and influence of global holding organizations such as the WPP Group and Omnicom, who in turn own several large agencies each, began in earnest in the 1980s and 1990s (Leiss, Kline, Jhally, & Botterill, 2005). Not only can such holding companies create and place global advertising campaigns, but they also encourage the practice of large-scale integrated marketing campaigns (IMC), where the traditional marketing functions of advertising, promotion, and public relations coordinate the placement of "on-topic" branded messages in many different locations. The Internet similarly encourages IMC, given its abilities to easily fold in traditional advertising forms with press releases, e-commerce, sales promotions, and publicity for sponsored and cross-promotional events. Social networking sites such as Facebook and Twitter have become valuable IMC tools that can complement and extend print and television advertising campaigns cheaply.

Hypercommercialism has several implications for our culture and society (see, for example, Budd, Craig, & Steinman, 1999; Bullen, 2009). It infuses our culture with amplified consumerist perspectives that further the social practice of brands and shopping as symbols for status and identity. Hypercommercialism shrinks the amount of ad-free cultural space (as Ralph Nader wryly notes at the beginning of this chapter), making commercial influences a powerful force in the public sphere. It undermines media literacy as commercial and noncommercial forms become difficult to distinguish, a primary criterion for evaluating when a message is designed to persuade and when it is designed to entertain or inform. Artistic and democratic autonomy in media is eroded, and critical examinations of consumer and commercial culture within media texts are muted. In its modern manifestations, hypercommercialism combines media messages with capabilities of digital technology, including e-commerce, data mining, target marketing, and niche market discrimination (for the latter, see Turow, 2006).

Hypercommercialism is a trans-media phenomenon. Using previous scholarship, the following sections review just a few – but by no means all – of the most striking cultural and mediated domains where such trends occur.

Film and Television Entertainment

The insertion of brands in films and TV has a long history (Newell, Salmon, & Chang, 2006; Turner, 2004). However, during the 1980s and 1990s product placement in film was further institutionalized and became an assumed industrial practice (Miller, 1990; Wasko, Phillips, & Purdie, 1993). Product placement encourages particular types of films: action-adventure and comedies (since these are conducive to commercial messages), movies with happy endings, and scripts with product placement-friendly scenes. Licensed-based films like The Mighty Ducks franchise (or comic-book-based films) not only plug the license but also create an environment for other product insertions (Fuller, 1997). Miller notes that the exchange of directing talent between movies and commercials influenced the style of films to make them more commercial-like. Rising costs encourage product placement opportunities be targeted early in the filmmaking process, even while the script is still being formed, and with assurances of positive framing for the brands (Clifford, 2010).

With its diversity of advertisers, television has a different history with product placement than film. Although the sponsorship era in the 1950s saw many product inserts, the routine placement of products in prime-time scripted shows was arguably downplayed from the mid-1960s until the 1990s. The 1990s featured a significant increase (Andersen, 1995; Budd et al., 1999). Reality television's "spontaneous," non-scripted image and commercialized financing of production helped legitimize the practice (Deery, 2004; Magder, 2009). Deery, for instance, argues that two subcategories of reality shows – the hedonistic and the Spartan – both ease the integration of brands. Hedonistic programs, like *The Apprentice*, wallow in the exhibition of high-end brands that are associated with *The Good Life* (see also Jenkins, 2006). Spartan programs such as *Survivor*, on the other hand, deprive contestants of brands and they are sometimes literally in tears when hosts offer up branded snacks as rewards. In such cases, brands become hailed as heroes to the contestants. However, as will be detailed later, product placement and product integration are now common in scripted television programs.

Other incentives encourage hypercommercial television content. Television programs and networks are designed to create friendly environments for advertising messages. Specific genres and channels oriented around makeovers (Sender, 2006), wedding and romance programs (Engstrom, 2008), and programs on The Food Network (Ketchum, 2007) celebrate the creation of identity and empowerment through consumption and heavily promote and merchandise branded goods, includ-

ing cross-promoted or synergistic partners. Wenner (2004) notes that with the increased sophistication of digital production techniques, retroactive digital inserts of products into older films and television shows may become more likely and introduce particularly dicey ethical concerns. Of course, home shopping channels integrate direct commerce with around-the-clock promises of not just bargains, but also class mobility through brand acquisition (Cook, 2000). Home shopping's ultimate legacy may be as an early model for the blending of television and e-commerce, as will be discussed in the chapter's conclusion.

Sports

Andersen (1995) labeled the marriage of brand marketing and large-scale mediated sports as "probably the most commercialized sector of popular entertainment." Mediated sports, given their entertainment orientation, appeal to consumption-oriented males (Vavrus, 2007), cultivation of passionate fandom, and image of being apolitical entertainment, make them a cultural form of great appeal to marketers and advertisers. The Superbowl, for example, is one of the biggest venues for high-profile advertising. The 1984 airing of the "Big Brother"-themed commercial that debuted the Macintosh computer was a watershed for large-scale "event" advertising (Stein, 2002). Since then, the Superbowl has become a large-scale celebration of advertising, with news coverage, advanced marketing hype, and reviews of the commercials afterwards (McAllister, 1999).

Sports are also visible cultural venues for corporate sponsorship, where brands are woven throughout team and event symbolism. Globally, sports such as soccer and rugby create long-term sponsorship deals with particular brands like Adidas. Such arrangements trigger struggles over the cultural meanings of teams as their status as both local or national public goods and their commercialized meaning as globalized commodity and sponsorship partners collide (Scherer, Falcous, & Jackson, 2008). In the United States, some of the most commercialized forms of sports are in the so-called amateur realm. The Olympics offers a long history of sponsorship association, including the 1992 Olympics and the heavy promotion of the US basketball "Dream Team" spreading messages of nationalism and individual heroism in different promotional forms (Wenner, 1994). US broadcasts of end-of-season college football bowl games fill the screen with both the title sponsor (such as the Tostitos Fiesta Bowl) and subsidiary advertisers throughout the broadcast of those games. The sponsor's name appears on field and stadium signage as well as on player uniforms, but also increasingly throughout the broadcast as digitally inserted graphics. In such cases, college sports arguably are among the most commercialized forms on US television; for example, less than 20% of the broadcast of the 2007 US national championship football game airing on the Fox network was without a corporate logo or brand name on the TV screen (McAllister, 2010).

As a highly commercialized form of entertainment, sports may serve as a “ground-breaker” for invasive marketing and therefore a source of legitimation for increased visibility of corporate brands in other venues and forms of culture.

Children’s Culture

Schor (2005) argues that the biggest growth market in the late 1990s was children, with US teen and “tweens” becoming “the most brand-oriented, consumer-involved, and materialistic generations in history” (p. 13). Kids’ media are especially characterized by a triple-whammy of marketing incentives: (1) media corporations such as Disney and Time-Warner promoting their own licensed merchandise (like iCarly and Superman, respectively); (2) kids-oriented brands for fast food, cereal, and toys/games heavily advertising and cross-promoting on children’s media; and (3) adult-oriented brands – vehicles and vacation spots – targeting kids because of their role as an important “influence market” over family purchasing decisions.

The commercialization of children’s media is therefore highly integrated, where it is difficult to discriminate media content from commercial and promotional messages. Books based on branded goods such as M&M Counting books mimic the packaging of those goods (Linn, 2004). Teen girl magazine articles about the prom focus on empowering the self through prom-oriented commodities also advertised throughout the magazines (Mazzarella, 1999). Branded programs on the Disney Channel and even state-funded channels serve as “program-length commercials” for licenses and brands (Mjøs, 2010). Children’s television flow between product commercials, branded programming, and branded “program separators” – the latter purportedly designed to create spaces between ads and non-ads but frequently using corporate logos – blend elements even further (McAllister & Giglio, 2005). Websites designed for children routinely contain unlabeled and integrated forms of advertising (Nairn, 2008). One such integrated form is the adverggame, blurring distinctions between marketing communication and mediated content. Games found on branded websites like Nickelodeon.com are more likely to restrict children’s play to a “branded universe” than foster more creative approaches. In some cases, the chat rooms in such branded sites limit responses to certain options via pull-down menus, with many of these options being brand licensing oriented (Grimes, 2008). Food companies that target children heavily use adverggames on their websites to promote their products; unhealthy foods high in sugar and/or fat are especially likely to use this promotional strategy, with candy and gum brands being the most frequently found advergamed food product (Lee, Choi, Quilliam, & Cole, 2009).

A children’s brand such as Bratz is not just available as dolls and toys but is also a *post hoc* media entity, featuring an animated television show, a live-action Hollywood film, DVDs, CDs, books, and magazines. Not only is the overall Bratz brand promoted in these media, but so are specific Bratz products as well as the perpetuating of shopping and consumption as a form of girl empowerment (McAllister, 2007).

Even without specific financial relationships between a media creator and marketer, children's media, including fictional books, may be filled with references to consumer brands as ways to distinguish character preferences, but still nevertheless encourage a consumption orientation (Bullen, 2009).

Journalism

A common assumption about the ideal structure of modern news is that a wall separates the business functions of a news organization from its news gathering functions. With this wall, reporters have autonomy from advertising and ownership influence and can maximize the contribution of journalism as a public good. However, many critics argue that this wall – if it ever really existed as a perfect barrier – has eroded against surging promotional tides (Bagdikian, 2004; Baker, 1994; McChesney, 1999). Advertising's effect on news is wide, including shifts toward more business-oriented stories and away from labor reporting, appeals to more upscale readers and the ignoring of more underprivileged areas of communities, hesitancy to criticize advertisers, acceptance of press release-oriented stories, and emphases on ad-friendly news topics such as celebrity, fashion, and lifestyle news. Ironically, shifts in advertising revenues may lead to the eventual demise of journalism's flagship medium, the newspaper, but this demise could also be attributed to newspapers' moving away from what they do best historically (watchdog and public advocacy journalism), a movement encouraged by their advertising-revenue orientation (McChesney & Nichols, 2010).

As examples like Starbucks' sponsorship of cable network MSNBC's *Morning Joe* program make clear (Stelter, 2009), television news may be especially susceptible to specific forms of hypercommercial content, including the insertion of advertising and promotional messages in the news. Wood, Nelson, Cho, and Yaros (2004) found significant brand mentions in late afternoon and evening television news, especially local news. They also found instances of what they called "cross-promotion" and what other scholars have labeled "synergy bias" (Williams, 2002) and "plugola" (Higgins & Sussman, 2007; McAllister, 2002). Morning news programs may be especially accepting of promotional and synergistic content (Cleary & Adams-Bloom, 2009), with stories about films, programs, or other brands owned by the parent corporation. In such cases, news becomes a promotional arm of its corporate parent, and it is a characteristic of news divisions owned by entertainment conglomerates oriented toward brand licensing.

Music

Modern music has long embraced aggressive forms of promotion, as payola scandals since at least the 1950s indicate. Integrated promotion is a staple of the modern music

industry. MTV, for example, was built on the idea of short promotional forms (music videos) as its early content premise. Music videos served as marketing vehicles for music sales and had a style that both influenced and was influenced by television advertising (Aufderheide, 1986).

As with many media facing the digital age, the music industry faces significant challenges to its traditional business model, and these challenges have encouraged an embrace of advertising partnerships. Klein (2009) explores the integration of music into advertising, arguing that increasingly artists are looking toward placement of their music in television commercials as both a potential revenue stream and a publicity vehicle. However, aside from economic drawbacks (including low synchronization fees and the limited life of any given ad), a cultural danger of such strategies is incentivizing musical creation to be advertising friendly. In fact, mentions of brands in songs have increased historically, with rap/hip-hop/R&B being especially pronounced in their use of brand-infused lyrics (de Gregorio & Sung, 2009).

Marketers also use and shape music for their own promotional purposes. Volkswagen upgrades its brand image by using off-beat songs in its commercials, sponsoring musical events including US public television's 2003 documentary series on the blues, and has even released CDs such as *Street Mix: Music from the Volkswagen Commercials, Vol. 1* (McIntosh, 2009). Internationally, corporations may sponsor musical events to circumvent policy restrictions on traditional advertising (Patel, Okechukwu, Collin, & Hughes, 2009) and associate with the hipness of global youth culture, although how fans respond to corporate branding may not always be under the branding corporation's control (Carah, 2010).

With sponsorship, product placement, webisodes, and other forms, the above contexts have often encouraged scholars to rethink the very nature of media content, given the unique and hybrid nature of hypercommercialism. The next section explores how the concept of the commercial "text" has been reconceptualized.

The Complex Nature of the Hypercommercial Text

For the most part, the main commercial text that scholars have studied is the advertisement: the full-page magazine advertisement or the 30-second television commercial. Many influential and insightful examples of studies examine the semiotic and ideological components of this conventional advertising text (Goldman, 1992; Williamson, 1978).

But by its very nature, hypercommercial content blends discrete forms of culture into a larger promotional mix that is difficult to clearly separate. Commercials, promotions, programs, movies, and other forms are stirred in a textual soup where, in everyday experience and increasingly in industrial practice, they are parts of a promotional whole. As surveyed below, scholars have made adjustments given the prevalence of hypercommercialized forms and are increasingly studying promotional

media not as a series of isolated commercials, promotions, or films but as a semiotic integration.

We see this in the large-scale promotional mix of synergistic media brands. The cross-media and coordinated licensing elements of synergistic corporate media lead to “commodity intertexts,” or various versions of brands (or texts) such as Batman that appear in different media like film, TV, comic books, books, music, videogames, and theme-park rides (Meehan, 1991). These intertextual licenses serve as revenue generators and as cross-media promotions for each other (Hardy, 2010). Media corporations thus promote licenses with as many of their owned media outlets as possible. Increasingly such intertexts are not just cross-media duplicates (images of Batman in various media) but advance an integrated metanarrative throughout the different versions, a marketing and narrative strategy labeled as “intertextual flow” (Proffitt, Tchoi, & McAllister, 2007) and “trans-media storytelling” (Jenkins, 2006). In such cases fans will miss out on a backstory, character motivation, or subplot development if they do not acquire all of the licensed manifestations. With the Matrix franchise, for example, the movies alone did not add to the official narrative arc of the story – so did the animated release *The Animatrix*, the *Enter the Matrix* videogame, and various “loaded” versions of Matrix DVDs.

A related but even broader concept is that of the “paratext” (Gray, 2010). Gray argues that increasingly media texts are supplemented – or even potentially subordinated – by related texts that promote, comment upon, and influence the meaning of those “original” texts. Although paratexts for media are not new – movie trailers are one early example – digital media have perpetuated them. Promotional “making of” features on DVDs can both influence the potential meanings of films and add “aura” or credibility to the film by discursively constructing the film as a great piece of art.

The paratext is a useful concept for other kinds of hypercommercial content besides media promotion. Increasingly, forms of advertising are being supplemented with their own paratexts that not only distribute the commercial message more widely, but also add legitimacy to the advertising message. For example, high-profile advertising campaigns like for the Toyota Prius (the “Harmony” campaign) often produce their own “making of” documentary features about the campaigns that are distributed on their branded websites and throughout video-sharing sites like YouTube. Such features serve several functions, including promoting the advertising agency and specific personnel that created an ad. But an important function is to influence potential interpretations of the ads so that the ads’ persuasive and ideological functions are de-emphasized, and their artistic and filmic characteristics are highlighted (McAllister, 2011).

Digital production and distribution have encouraged another type of commercial paratext: user-generated content, much of which is commercially based, including its most intense form, the user-generated commercial (UGC). Typically in these cases a marketer will hold a contest that invites consumers (presumably “fans” of the brand) to submit a homemade commercial for the brand, posting the submissions to

a website where other consumers/fans comment and vote on the UGCs. A contest for Dove Body Wash attracted thousands of submissions, brought visitors to the contest site, generated media publicity for the winning ad that aired during the 2008 Oscar broadcast, and embedded the contest and UGCs in a discourse of feminist empowerment and artistic achievement (Duffy, 2010). This last strategy converges with comparable themes in “making of” documentaries of ad campaigns that seek to elevate the cultural status of the brand and campaign.

Similarly, social networking sites like Facebook provide advertisers with unique opportunities to capitalize on free consumer-provided labor (Cohen, 2008), including user-generated praise for brands on Facebook pages or “fanning/liking” the pages of companies or even advertising mascots. This user-generated activity adds to the credibility of branded Facebook pages and spreads the brand to other Facebook friends’ pages. Data that are mined from social networking profiles allow ads to be precisely targeted, blurring user content with the ad messages and obscuring the fact that the site is structured to steer users toward sponsored groups (Morrissey, 2006).

Other commercial forms of hybridity complicate how one conceptualizes the idea of the “main” commercial text. Budd, Craig, and Steinman (1999) argue that the similar styles and icons between network television and television commercials – including product placement and shared acting talent in ads and programs – can be viewed as a giant “commodity flow” where viewers are encouraged to understand connections between different content forms and see them as interconnected. Similarly, kids’ television’s mix of corporate branding, commercials, licensed programming, and cross-promotion often obliterates differences between promotional and nonpromotional categories as these forms flow into each other. In one three-hour block of programming on ABC Saturday morning in 2002, for example, the word Disney was said or shown 178 times in various content categories such as opening/closing credits for licensed-based programs, branded program separators, product ads, and program promotions (McAllister & Giglio, 2005).

As implied by the above, specific contexts in which hybrid commercial texts are embedded are important and complicate commercial scholarship. Although the availability of television programs and movies on DVDs facilitates the study of such texts compared to the days of nonrecordable film and television, it also encourages a tendency toward decontextualization of the texts from specific commercial contexts of reception. Watching a film on DVD removes it from the commercial and promotional paratexts of the theatrical setting, and adds potentially very different paratexts. Even more dramatically, studying a commercial network television program through a DVD release, iTunes file, or video-sharing website takes that program away from its original context in which specific ads and promotions surrounded the program. For research that focuses on hypercommercialized qualities, this context may be critical for understanding initial meaning formation around integrated commercial messages. The following section describes one such example where the context of commercial paratexts matters.

Commercial Paratexts and Contexts in *30 Rock*

Cross-promotions between product advertisers and media companies generate paratexts that add meaning to traditional advertising messages. In the case of the product advertiser, the association with a TV show or movie helps to legitimize and glamorize the brand. But the flow of meanings works both ways. The coordinated and cross-promoted advertising messages may also serve as paratexts to the media texts, changing or altering the meanings of the film or television program.

Take, for example, the use of parody about product placement in a November 16, 2006 episode, “Jack-Tor,” of the television program *30 Rock*. As a program co-produced by NBC Studios and NBC Universal Television and distributed by the NBC network, *30 Rock* results from vertical integration – with producer and network being owned by the same company. Given that in the economic structure of network television advertisers pay the networks directly, the combined producer/distributor role makes the program more easily accessible by advertisers than programs produced independently of the network (an increasingly rare characteristic).

This particular episode opens with main character Liz Lemon and the other producers and writers of the “show-within-a-show” on *30 Rock*, *TGS*, listening to a video presentation for a new initiative by Jack Donaghy, the NBC executive who supervises *TGS*. At this time, GE owned NBC (a network now owned by Comcast). In the video, Jack says:

For over a hundred years, GE has been imaging the future, today. And I’m here today to talk to you today about a wonderful new synergy. It’s called product integration. It’s revolutionizing the way we monetize broadcast television. How does it work? Simple. All you have to do as the writing staff of an NBC show is incorporate positive mentions, or “pos-mens,” of GE products into your program. For example, you could write an episode where one of your characters purchases, and is satisfied with, one of GE’s direct current drilling motors for an offshore or land-based project. Product integration, setting a new standard in upward revenue stream dynamics . . . for all of us.

Once the video is over, those around the table react indignantly, although comically contradictorily, to the new initiative:

LIZ:	I’m sorry, you’re saying you want us to use the show to sell stuff?
JACK:	Look, I know how this sounds.
LIZ:	No, come on Jack. We’re not doing that. We’re not compromising the integrity of the show to sell . . .
PETER [drinking a Snapple]:	Wow! This is diet Snapple?!
LIZ [smiling broadly]:	I know! It tastes just like regular Snapple, doesn’t it?
FRANK:	You should try Plum-a-Granate. It’s amazing.

- CERIE [directly at the camera]: I only date guys who drink Snapple.
- JACK: Look, we all love Snapple. Lord knows, I do. But focus here. We're talking about product integration.
- LIZ: No, we're not your shills.
- JACK: Oh, oh, I'm sorry. That's right, they're artists, like James Joyce or Strindberg. Get real, kids, you write skits mocking our presidents to fill time between car commercials.
- LIZ: That's not fair. Josh gets a lot of fan mail for Gaybraham Lincoln.
- JOSH [in an effeminate voice]: Four score and seven beers ago.
- LIZ [looking at a Snapple cap]: Guys know that Holland is the only country with a national dog? There's little facts in there.

The use of parody of product placement has a fairly long tradition, going back at least to the 1992 movie *Wayne's World* and continuing through the earlier mentioned *Pom Wonderful Presents . . .* In the case of *30 Rock*, the scene comments on two forms of promotional intrusion on television programming: synergistic corporate ownership and product placement from external corporations. Here the "joke" is that, although the character of "Liz Lemon" expresses outrage at the over-the-top mandate to use the euphemistically labeled "pos-mens" as a form of GE corporate ownership synergy, the corporate commodity that is "Liz Lemon" (as well as all of the characters in the scene) becomes subservient to another form of commercialism, product placement from the external brand, Snapple. Five characters often at odds with one another in the program – Liz, Jack, Peter, Frank, Cerie – unite in their love of Snapple. One could take this scene as a vicious comment on selling out; the characters are not even aware of their contradictions, although these contradictions are clearly being signaled to the audience (Jack later in the episode calls such self-referential comedy "hippie humor").

Although amusing, the scene's stance on product placement is contradictory. For example, how might we interpret Jack's earnest criticism of the television staff's claim of moral purity, and their response to this criticism? He is arguably framed in the debate as a voice of reason. He contends that for them to think of themselves as having artistic integrity as television workers is delusional; they instead produce puerile entertainment that caters to the lowest impulses of the masses, a criticism that Josh then confirms with his Gaybraham Lincoln gag. Jack's point about TV being a sell-out medium is of course further justified by the Snapple "shilling" that occurs before and after his counterpunch, a shilling in which Jack himself willingly participates. (A later scene in the episode briefly shows a man in a Snapple costume asking directions for the Human Resources department of NBC.) Jack's scolding therefore offers a corporate perspective and takes a little of the bite out of the point of the parody: if TV is already a medium of selling out, what difference do a few "pos-mens" make?

This particular episode – airing early in the show's run – was reviewed quite a bit in newspapers and online. A few television critics at the time – perhaps watching pre-

broadcast DVDs sent to them by NBC to encourage reviews for the new show – commented on the scene’s conflicting messages. Put another way, the reviewers are noting the scene’s multiple “polysemic” meanings. Tom Shales of the *Washington Post* interpreted the scene as “shaky,” unclear, and perhaps positioning the viewer with Jack:

Presumably, viewers are not to take seriously Liz’s pompous announcement – that “we are not compromising the integrity of this show” – when Donaghy asks her to insert product placements, for such GE wonders as its offshore drilling motors, into the comedy scripts. But then in a blink, Liz is heaping gratuitous praise on Snapple, by name, and later a man dressed as a bottle of Snapple saunters into the scenario.

Is Fey making fun of the show-within-the-show or the show itself? Or both, or neither? (2006, p. C1)

Another reviewer critically noted the promotional benefits of even a parodist representation: “The only problem with sitcoms asking us to contemplate ‘stuff’ is that the way they do it forces us to think even more about the things they’re selling. This is not just irony, it’s bottomless, grinning cynicism” (Dailey, 2006, p. A2).

For fans who posted reviews for this episode on such sites as tv.com and imdb.com, the parodies were judged by their humor, not their critique. From imdb, for example, one fan wrote, “The Snapple gag didn’t make me laugh at first until it emerged for a second time unexpectedly,” while another offered, “Funniest scenes were when Liz refused to sell out, she and the other characters were suddenly plugging the Snapple drinks culminating in a walk-on by someone wearing a Snapple costume.” On tv.com, a fan wrote, “I loved the jokes about product placement, so much so that I’ve since shown that part to a few friends.”

But why Snapple? Was Snapple just an absurd brand to parody (“Plum-a-Granate”), or was there another reason Snapple was used? The scene itself is unclear on this, and therefore a viewing of this scene on DVD, or even as a rerun later in the season, that does not include the original commercials would leave this question open. However, this question was answered in another venue: the original broadcast of this episode in 2006 that did include commercials. Aside from the polysemic or humorous stance of the scene itself, the flow of commercial messages in this original broadcast is another factor that may influence the critical interpretation of the scene.

The above-described Snapple scene functions as the opening pre-credits sequence (or “cold open”). After Liz expresses her amazement at the Snapple-provided Holland-dog factoid, the program immediately cuts to its opening credits. Then, the first commercial after this break is an ad for Snapple, shot in a quirky style not unlike that of *30 Rock*.

Just as Gray (2010) argues that one effect of paratexts is to reinforce “preferred” interpretations of primary texts, here then the commercial that follows the opening scene reinforces that Snapple was a friendly and like-minded business partner of NBC, and that the parody of product placement arises from a product placement deal, and is therefore not a fundamental criticism.

As a paratext, this commercial tie-in may influence a critical reading. For example, another television reviewer, commenting in her blog and clearly watching the real-time broadcast version, noted the role of the Snapple commercial in altering her interpretation of the opening scene: “Last night’s episode was fun, especially the Snapple bit, though it was kind of ruined when they cut to a commercial break and there was an actual Snapple commercial. I felt like I’d been set up and I don’t like feeling set up” (de Moraes, 2006). In this case, the reviewer overtly signals that the commercial paratext aired during the original broadcast context influenced her interpretation. For others with similar interpretative schemas, such a feeling of being set up may make it difficult to trust any discussion of brands or commodities in advertising-supported media. How do we know that any mention, review, examination, parody is not a result of a cross-promotion?

In fact, as de Moraes suspected, the Snapple placement *was* part of a larger campaign by Snapple’s parent company, at that time named Cadbury-Schweppes, that year. What may be especially surprising about this deal is how cheaply NBC sold out its program. According to one trade article, the cross-promotion required that “the company neither pays any additional fees for integration nor does it have to increase its network media buys,” although Snapple point-of-purchase displays may have promoted the tie-in, thus “sweetening the pot” (Schiller, 2007).

Given the economic relationship, we may also ask about the meanings that the paratextual relationship has for the commercial marketer. In Snapple’s case, to what extent does it enhance Snapple’s brand when the brand is in on the joke (when it is also aware of the self-reflexive “hippie humor”), especially since the marketer chose a commercial that was similar in style to the program in which it was embedded? Although de Moraes, as a professional TV writer, was turned off by the commercial paratext, other viewers may have found it delightful that Snapple was in on the joke, as the Snapple commercial potentially signaled: the company is hip enough to make fun of itself and even uses the same sort of humor itself – a style of humor that presumably is enjoyed by *30 Rock* fans. None of the online fans quoted above indicated their reaction to the program–commercial combination, so it is unclear to what extent they may be noticed or been influenced by it.

A later *30 Rock* example also illustrates how the textual relations between media and commercial texts may influence meanings and even make it difficult to hierarchize such texts as “para” or “primary” (as Gray argues is problematic for modern media texts generally). A commercial airing during a March 2010 episode was somewhat hyperbolically labeled by the trade journal *Advertising Age* as a “new direction” in ad-media cross-promotions and signaled “the day when commercials are indistinguishable from the programs they support finally arrived” (Steinberg, 2010). This commercial for Dr. Pepper (part of the same Snapple corporation) featured comedic actor Chris Parnell as Dr. Spaceman, the good-natured but inept *30 Rock* character who says the tagline of the then-current campaign (“Trust me, I’m a doctor . . .”) but adds a particularly *30 Rock*-esque touch (“. . . in seven states and Bermuda”).

In this case, it was the commercial that copied the noncommercial text, having the character evoke the same goofy persona in an ad as he does in a *30 Rock* episode. In this case, then, the program serves as a fairly explicit paratext for the commercial. Although the ad can be understood without any textual knowledge of *30 Rock*, that intertextual knowledge arguably makes the commercial funnier as one immediately recognizes the Spaceman's character and humor. This is true whether the ad is viewed in its original broadcast context or on YouTube. But because the commercial first debuted during a *30 Rock* episode, that context reinforced the similarity between the commercial and the program. Even though apparently the specific *30 Rock* production company was not involved in the making of the commercial (Steinberg, 2010), the overall visual style and soundtrack of the commercial mimicked the program. In this way, the commercial was more similar in its style to the episode than to other ads in this campaign. That a more traditional Dr. Pepper commercial in that same campaign also aired during the same episode both reinforced the connection between the program and its sponsor, and signaled the "designer" nature (Deery, 2004) of the Spaceman ad where it references the specific program in which it is embedded as a special variation on this connection.

Other product integration/ad spot deals appear on *30 Rock*, some without such an ironic frame as in the first season. A February 2009 episode featured McDonald's McFlurries as a key plot device (Jack: "These McFlurries are amazing!") with McDonald's commercials airing during the program, and a May 2009 episode mentioned the Universal (and NBC sibling) film *Mamma Mia!* (with Liz calling it "the international film song-sation!") followed by a commercial for the DVD.

By no means was *30 Rock* alone in such commercial tie-ins. Its sibling program *The Office* had similar textual connections to ads for Chili's restaurants, the iPod, and Staples office supplies, and the much-loved Fox television show *Arrested Development* struck a similar deal with Burger King integrated into a 2005 episode. Increasingly corporate-driven media view such commercial intrusiveness as a necessary condition for profit maximization.

Conclusion: Interactive Product Placement and Antimarketing Blowback

This chapter has reviewed trends in hypercommercial media content. It focused on different content genres such as film and television, sports, children's content, news, and music to discuss how hypercommercial influences cut across different types of content. The chapter also explored the multifaceted characteristics of hypercommercial and hyperpromotional texts, including their "messy" nature as a text and integration of related hypercommercial paratexts and the importance of studying such texts in different contexts. Given the traditional tools at the disposal of marketers – commercials, promotions, sponsorship, and product placement/integration

among them – and their varied use, scholars should use care to understand how these tools may vary in different outlets.

Such texts and trends will continue to be a major influence in our media culture, and may intensify in the near future. The chapter has mostly focused on how hypercommercial content integrates advertising influences into what historically are considered noncommercial content forms. But the Internet and other digital media forms have added additional characteristics that may be blended into hypercommercialism even beyond web surfing. A characteristic of the Internet is its combination of selling and e-commerce, as sites like amazon.com can place promotions for products on the same screen as purchasing capabilities (Spurgeon, 2008). The data-mining nature of the Internet also means that such sites can target specific promotional appeals based upon the previous and current surfing patterns and purchasing history of the web user.

What we may be seeing as we move toward digitization is an accompanying commercialized future. Take television as an example, and certain precedents that ultimately could be models for a new hypercommercial model. As previously mentioned, home shopping channels integrate viewing with purchasing (Cook, 2000). Additionally, “enhanced” format reality television like *Big Brother* allows viewers to offer feedback about outcomes, a form of interaction that is consumption-based (Nightingale & Dwyer, 2006). As television becomes more Internet-like, it may continue in these directions by integrating interactivity and e-commerce capability not just within advertising forms, but even within programming forms. We may see the technological capability to purchase products featured in programs, a capability that, once enacted, may then be expected by advertisers as a routine part of television. In addition, the ability of television to collect data about media use to create targeted advertising messages – as the Internet now routinely offers – could continue to be folded into advertising logic and expectations of television and other media (Andrejevic, 2009). So, our hypercommercialized television screen of the future may include the ability to purchase not just generic products that are integrated into television programs, but even targeted products that are digitally inserted for particular viewers based upon their consumer data profile. In these cases the influence of advertising upon programming decisions will be fundamental and intimate, and will create even more commercialized contexts that may vary not just by medium or type of commodification, but even by individual user.

Other forces can stem the tide of an increasingly hypercommercialized future. Concerns about the future of journalism have triggered conversations among policymakers about alternative funding sources besides advertising (McChesney & Nichols, 2010). Privacy concerns may also influence the creation of more restrictive policy toward data collection as such models expand beyond the Internet. And as Klein (1999) has documented, when corporations overreach their social authority, people can fight back. Culture jammers, public protests, and political movements can result from groups angered by the very visible nature of overly aggressive corporate branding. Klein’s focus on such trends in the 1990s perhaps captured a particular

historical moment and was more about the corporate takeover of public space than about media content. Nevertheless, her work serves as a model for democratic blow-back in an era of YouTube and social networking sites that can be used for political organization as well as for integrated marketing. A digitized media future may offer more variants of hypercommercial content, but also can offer anticommmercial advocates more tools for protest as well.

Changes in Children's Advertising in the United States

Nancy A. Jennings

ABSTRACT

Many children worldwide spend a considerable amount of time with media. However, children's exposure to advertising may differ as a reflection of different public policies enforced around the world. Many policies worldwide place limits on the amount of advertising permitted, yet concerns rise about the nature of the messages (whether few or many) that children encounter. Therefore, this literature review will examine advertising messages that appear in children's media environments, focusing on television content and then exploring advertising in new media, specifically online advertising. Content analyses of electronic advertising reflect the interplay between public policy, industry self-regulation, and marketplace forces. As such, the United States provides an example of how these three forces operate together and is the focus of this review.

Many children growing up in the world today spend a considerable amount of time in front of the television screen. For example, recent research indicates that US children ages 8–18 spend a little over 7½ hours with media per day, and over half of that time (4½ hours) is spent with TV content (Rideout, Foehr, & Roberts, 2010). Irish children ages 4–14 spent an average of over 2½ hours per day watching television

between 2000 and 2002 (Broadcasting Commission of Ireland [BCI], 2003). Similarly, Australian children ages 0–14 years watched an average of over 2½ hours per day of free-to-air broadcasts in 2001 but decreased to just over 2 hours per day by 2006 (Australian Communications and Media Authority [ACMA], 2007). Indeed, daily viewing time of children in Poland, Spain, the United Kingdom, France, Australia, Sweden, and Germany increased in 2010 compared to 2009 (Szybist, 2011). Considering the amount of television children watch, their exposure to television advertising is potentially quite high. Research in the United States suggests that young children ages 2–7 years see an average of 13,904 television ads per year, whereas children ages 8–12 years see 30,155 ads, and children ages 13–17 years see 28,656 ads (Gantz, Schwartz, Angelini, & Rideout, 2007). However, children's exposure to advertising may be quite different around the world as a result of public policies regulating children's advertising.

A full spectrum of regulatory policies of children's advertising can be found around the world. Some countries such as Sweden and Norway ban all television advertising directed to children under 12 years of age (Gunter, Oates, & Blades, 2005). Other countries restrict advertising to younger children only or during and adjacent to children's programs. Australia does not permit advertising during programs targeted to preschoolers (ACMA, 2005). In the Flemish area of Belgium, no advertising is permitted within 5 minutes before or after programs for children under the age of 12, and Denmark prohibits advertising breaks during programs throughout the broadcast day (Quinn, 2002). By contrast, other countries permit advertising to children, but the parameters for permitted children's advertising in various countries differ as well as the authority of the government in relation to self-regulatory agencies. For example, in the United States, governmental regulation permits no more than 12 minutes of advertising per hour on weekdays and 10.5 minutes per hour on weekends at the macro level (Kunkel & Wilcox, 2001). However, content guidelines are not federally mandated. The self-regulatory agency of the Children's Advertising Review Unit (CARU) offers guidelines but relies on the "good-faith cooperation of advertisers" to follow their suggestions (Kunkel & Gantz, 1993, p. 151).

While many policies worldwide place limits on the amount of advertising permitted, concerns rise about the nature of the messages (whether few or many) that children encounter. Therefore, this literature review will examine advertising messages that appear in the children's media environment, focusing on television content and then exploring advertising in new media. The review will focus on quantitative content analysis research that takes a broad-based look at the advertising on children's television. Research that focuses on one specific category of television advertising (such as food advertising) or one key element of advertising depictions (such as character gender) is excluded from this current review. Moreover, this review will focus on advertising practices in the United States as an example of the interplay between self-regulatory guidelines, governmental regulation, and marketplace forces.

Television Marketplace and Policy Changes in the United States

Trends in advertising content on television are particularly interesting given media and policy changes in the United States over the years. Three notable changes occurred in children's media during the 1980s. First, a "licensing frenzy" (Bryant, 2007, p. 19) flourished as toy manufacturers, content creators, and broadcasters formed relationships that blurred the lines between content and marketing, creating branded play both on and off the screen. Second, cable began to penetrate more and more homes in the United States. Along with the rise of cable came the launch of two channels dedicated entirely to the child audience, Nickelodeon and the Disney channel, in the early 1980s. These channels provide a specialized outlet for advertisers to reach their target audience. Finally, videogames began to become popular in the home, and with portable games available by the end of the 1980s, the future of advertising and children's media would forever be changed.

Marketplace changes reflected policy changes in children's media regulation. Alexander and Hoerrner (2007) refer to the 1980s as the "deregulation decade" in which "the marketplace was supposed to separate quality programs from junk, and it was supposed to punish advertisers who unfairly target children with deceptive messages" (p. 36). The Federal Communication Commission (FCC) determined that if appropriate alternative programming existed for children in the community, then the broadcaster was no longer responsible to serve the needs of the child audience (Kunkel & Wilcox, 2001). The result of this deregulatory position from the FCC was reflected in the abundance of program-length commercials where the lines of marketing and content are blurred through toy, product, and content tie-ins as described above. This blurring had further implications for the FCC's second major type of policy known as the "separation principle" in which stations are mandated to maintain a clear distinction between program and commercial content. During this era of deregulation, the FCC relaxed its position on program-length commercials originally defined as programs associated with products, hence the prevalence of these types of programs in the 1980s. Faced with pressure from Congress to re-regulate the industry, the FCC redefined program-length commercials to resemble the definition of host-selling such that traditional advertising engaging the use of television characters to promote a product could not be placed adjacent to or within a children's program involving those characters.

Another programming policy change that had implications on advertising regulation was the adoption of the Children's Television Act (CTA) of 1990, which marked the end of the deregulatory era and the beginning of the "decade of reckoning" (Alexander & Hoerrner, 2007, p. 37). One requirement of the CTA of 1990 was the restriction of the amount of advertising permitted during children's television programming to no more than 12 minutes per hour on weekdays and 10.5 minutes per

hour on weekends. The regulations went into effect in fall of 1992, and a study of seven markets indicated a reduction of one 30-second advertisement on average between 1991 and 1992 (Snyder, 1995). However, by 1994, advertising had returned to pre-Act rates (Snyder, 1995) similar to rates documented in 1993 by Byrd-Bredbenner (2002). By 1999, the networks were back in compliance (Byrd-Bredbenner, 2002) and appeared to have remained in compliance in 2005 when all commercial broadcast stations reported an average of 7.95 minutes per hour of advertising content during children's programs (Gantz et al., 2007).

Moreover, as digital television came into existence, discussions opened concerning broadcasters' obligations to serve the child audience in the new digital age in respect to advertising and program content material both online and on digital television. In the fall of 2000, the Federal Communication Commission released a Notice of Proposed Rulemaking (FCC-00-344) to seek comments on a variety of issues relating to digital television and the child audience (FCC, 2000). After reviewing the comments, the FCC released a Report and Order (FCC-04-221) with new proposed rulemaking (FCC, 2004). In respect to advertising and children, the Report and Order prohibited the appearance of websites in programming content that links to commercial material, redefined commercial material to include promotions for non-educational programming, and changed the definition of host-selling. On February 9, 2006, child advocate organizations such as Children Now and various representatives from the industry such as Viacom, The Walt Disney Company, and Fox Entertainment Group submitted a Joint Proposal (FCC-06-33A2) to the FCC which suggested the following changes in relation to advertising content: (1) the Website Rule; (2) the Host-Selling Rule; and (3) the Promotions Rule (FCC, 2006).

The Website Rule

The FCC proposed that any display of websites during programming directed to children ages 12 and under be permitted as long as they meet the following criteria: (1) the website provides substantial program-related or other educational material, (2) the website is not primarily intended for commercial purposes, (3) the website's home page and other pages clearly separate and label commercial from noncommercial content, and (4) the website is not used for e-commerce or other commercial purposes (FCC, 2004). Any websites that do not meet this four-part test would be counted toward the total minutes of advertising time permitted by the Children's Television Act of 1990 (no more than 12 minutes per hour weekdays and no more than 10.5 minutes per hour on weekends). The Joint Proposal suggested that display of websites only count toward the total time allotment if the display is during programming material or during a promotion, and that the promotion needs to be clearly separated from programming material (FCC, 2006).

The Host-Selling Rule

The FCC proposed a ban on the display of websites during children's programming or during commercial material that use characters from the program to sell products or services (FCC, 2004). The Joint Proposal suggested website addresses displayed during or adjacent to a program should not contain products that feature characters from that program or characters appearing in that program that are actively used to sell the products. However, this rule should not apply to third-party links from a company's web page, on-air third-party advertisements with websites, or pages that are primarily dedicated to multiple programs or multiple characters (FCC, 2006).

The Promotions Rule

According to the FCC, commercial matter is redefined to include promotions of non-educational or informative television programs or video programming services (FCC, 2004). The Joint Proposal suggested that promotions for children's or other age-appropriate programming appearing on the same channel or promotions for children's E/I programming on any channel should not be included as commercial matter (FCC, 2006). Until 1999, time for program promotions hovered between one to two minutes per hour (Barcus, 1975; Condry, Bence, & Schiebe, 1988; Kunkel & Gantz, 1992). However, in 1999, the time for program promotions jumped dramatically to almost five minutes per hour (Byrd-Bredbenner, 2002).

Decision

On September 26, 2006, the FCC approved a Second Order on Reconsideration and Second Report and Order based on revisions filed in response to the 2004 Order and the Joint Proposal. As such, the FCC adopted the changes suggested by the Joint Proposal in order to make a clear separation of commercial websites from programming content. In regard to the FCC's proposed host-selling rule, the FCC permits the sale of merchandise featuring a program-related character in parts of the website that are clearly and sufficiently separated from the program itself. Finally, the FCC accepted the suggestion made in the Joint Proposal and refrained from considering promotions as "commercial matter."

Historical Comparisons of Non-Program Content in Children's Television in the United States

Despite concerns voiced about the effects of advertising on children and youth, few *comprehensive* content analyses that cover all forms of non-program content during

children's programs have been conducted. In the early 1970s, F. Earle Barcus documented the state of advertising and non-program content during children's television programming. His work set a precedent for examination of non-program content and has been replicated and applied to television advertising from the 1950s (Alexander, Benjamin, Hoerrner, & Roe, 1999), 1980s (Condry et al., 1988), 1990s (Byrd-Bredbenner, 2002; Kunkel & Gantz, 1992), and in the new millennium (Gantz et al., 2007).

Given this similarity in coding schemes, comparisons can be made across time with a few exceptions. First, to date, no published studies have been discovered for television advertising on children's programs in the 1960s. Therefore, for this literature review, the 1960s will be omitted from analysis. Second, Gantz and his colleagues (2007) employed a different strategy for sampling of programs. They submit that since children often watch programming that is intended for a broader audience, it is necessary to examine the advertising content in programs children actually view rather than limiting the analyses to just programs produced for children. All of the other studies included children's programming only. Therefore, comparisons are limited with this most recent study (Gantz et al., 2007). Third, Kunkel and Gantz (1992) made distinctions between cable and broadcast networks in their analyses. When appropriate, comparisons will be made with broadcast networks only across time, but the results regarding cable in 1990 will be provided.

Amount of Non-Program Content in the United States

Barcus (1979) identified four different kinds of non-program content including: (1) commercial product announcements, (2) program promotional announcements, (3) noncommercial announcements, and (4) other/station identification. The commercial product announcements were advertisements for products and included such codes as the name of the manufacturer, the product advertised, product claims, and marketing tactics. The program promotions included announcements for upcoming television programs. The noncommercial announcements consisted of public service announcements, and the last category captured other announcements including station identification messages. In the 1980s, Condry and his colleagues (1988) separated the noncommercial announcements into two categories: (1) public services announcements (PSAs) and (2) educational drop-ins (drop-ins). Both of these categories involved educational messages about health, safety, nutrition, and other information. However, a PSA was created by a nonprofit organization whereas a drop-in was produced or co-produced by a network. Furthermore, Condry and his colleagues combined program promotions with station identifications under the category of promos. Byrd-Bredbenner (2002) followed the same categorization as Condry and his colleagues (1988), whereas Kunkel and Gantz (1992) separated the station identifications from other types of messages. For comparison with Barcus, the PSAs and drop-ins were combined as well as station identification and the "other" category.

Figure 2.1 Non-program content type by year.

Changes can be seen across the years in both advertising and noncommercial announcements (see Figure 2.1). For a decade between 1975 and 1985, commercial advertising remained at its lowest (between 7 and 8 minutes) on broadcast networks. Beginning in 1985, the amount of advertising content rose, reaching a peak in 1993. By the end of the almost 30-year span, the amount of advertising returned to near original rates at just under 10 minutes per hour.

While advertising content seemed to rise, less time was spent on noncommercial messages. The amount of time dedicated to noncommercial content reached a peak in 1983 at 3.20 minutes per hour. After 1983, noncommercial content decreased to reach its all time low in 1993. In 1999, an increase was noted. Indeed, between 1983 and 1993, as the amount of time for commercial messages continued to rise, the amount of time dedicated to noncommercial content waned. As a result, there became a growing emphasis on advertising rather than on the noncommercial content such as educational drop-ins and public service announcements.

Moreover, the average length of a commercial on the networks has changed dramatically since 1950, but held relatively stable from the 1970s to the 1980s. Standardization of programming and advertising length was not a common practice in the 1950s. As a result, the length of advertisements in the 1950s ranged from as short as 11 seconds to as long as 3½ minutes; however, the average length of advertisements in the 1950s was a little over 1 minute (Alexander et al., 1999). Over time, advertisements begin to decrease in length. Between 1971 and 1975, the average commercial length declined from .56 minutes to .50 minutes (Barcus, 1979), the equivalent of the new 30-second spot.

Indeed, in the 1970s, the vast majority of the advertisements (92%) were 30-second spots (Atkin & Heald, 1977). The average commercial length continued to shrink in the 1980s. The average commercial length began at 30.90 seconds in 1983 and gradually decreased to 29.63 in 1984 and to 29.31 seconds in 1987 (Condry et al., 1988). Kunkel (2001) suggests that advertising spots may even be as short as 15 seconds in the 1990s, although no studies conducted in the 1990s or the 2000s report the average commercial length.

Products Advertised in the United States

While seasonal differences were observed in the frequency of toy commercials (Barcus, 1980; Condry et al., 1988), research in the 1970s indicated that four product categories – toys, cereals, candies, and fast food restaurants – made up the lion’s share of product types advertised to children, accounting for 80% of all ads (Barcus, 1980). This was a dramatic change from advertising in the 1950s where only 44% of commercials advertised products in these categories (Alexander et al., 1999) (see Figure 2.2). Products such as appliances, dog food, and food staples such as milk

Figure 2.2 Type of products advertised by year.

and peanut butter were more common at that time, which may be a reflection of the novelty of television such that even adults would watch children's programs (Alexander et al., 1999). Studies conducted in the 1980s and early 1990s indicate that the four product categories from the 1970s still dominated the field, but fluctuation in the distribution of these categories changed over time. By 1975, cereals (25%) and sweets (25%) accounted for half of the products advertised (Barcus, 1979). However, in the 1980s, advertisements for candies (17.2%) and cereals (22.8%) declined while toy commercials (36.2%) increased dramatically (Condry et al., 1988).

Ads for "other" products – including such things as hygiene, clothing, leisure activities, recreation parks, recorded music, and entertainment – have also experienced fluctuation. Ads for "other" products grew in the 1980s, reaching a peak in 1985 at 18.5% of all advertisements (see Figure 2.2). However, these fluctuations were noted on broadcast networks only. In 1990, a comparison could be made between types of products advertised during children's programs on cable networks and on broadcast networks. Interestingly, advertisements for "other" products accounted for a little over a third of all advertisements on cable networks. Schor (2004) suggests that cable companies such as Nickelodeon place such advertisements during children's programs to influence what has been called the "influence market." McNeal (1992), a leading scholar in children's consumer behavior, posits that children are three markets in one – they spend their own money (current market), they influence their family's purchases (influence market), and, through their own consumer experiences as children, they can become brand loyal into adulthood (future market). As part of the influence market, children in the United States have had more of a voice in parental purchases to the extent that many parents now believe that they know less about products than their children (Schor, 2004). Moreover, by 1983, over 70% of children's television programming hours came from cable (Pecora, 1998). Therefore, it would be expected that children would be watching cable more than network children's programming and, thus, would be influenced by the prevalence of "other" adult-oriented advertisements.

The 1990s marked an era of change in other ways. First, by the end of the 1990s, the distribution of toy advertisements returned to those found in the 1950s, with a decrease in commercials for toys to 10% by 1999 (Byrd-Bredbenner, 2002). Second, the percentage of advertisements for candy and snacks reached an all time high at 36% of all commercials (Byrd-Bredbenner, 2002). Finally, a noteworthy increase was observed in fast food advertising in the 1990s. Starting at 8.7% of advertising in 1990 (Kunkel & Gantz, 1992), fast food marketing increased to 22% of all advertising by the end of the decade (Byrd-Bredbenner, 2002). This rise in advertising of sweet, non-nutritious food has become of increased concern as the rate of childhood obesity has risen over the past 30 years. Since 1980, childhood obesity has tripled among school-age children and adolescents (Ogden, Carroll, Curtin, Lamb, & Flegal, 2010). Therefore, a number of recent studies have begun to examine the nature of advertising of food to children.

Selling Techniques and Appeals in the United States

Little has changed in the types of appeals used to advertise to children. In the 1950s, the appeal to “fun” was found in two-thirds of all ads directed toward children, followed by an appeal to “taste” (Alexander et al., 1999). Results from the 1970s indicate that appeals were closely tied to specific categories of products. For example, in food products, the most frequently used appeal was “taste” whereas “action/speed/power” and “appearance of the product” were most frequently used in commercials for toys (Barcus, 1975). Research in the 1990s found appeals being used in a similar way. “Taste/flavor/smell” was most commonly used in cereal and breakfast food ads (46.6%) and “product performance” was most commonly used in toy commercials (Kunkel & Gantz, 1992). However, it should be noted that in the advertisements for fast food restaurants, “fun/happiness” was the most common appeal used (71.9%) in the 1990s, suggesting that “good times may indeed be more important than great taste in selling hamburgers” (Kunkel & Gantz, 1992, p. 146).

Various selling techniques have been used to attract the child audience. The use of premiums and prizes declined dramatically in the 1950s. Only 11 commercials had premiums or prizes, yet nearly all of these commercials (10 or 90.7%) appeared in the first half of the decade (Alexander et al., 1999). Premiums continue to be a selling technique employed in the 1970s and 1990s, and, similarly to the use of appeals, premiums were more likely to be used for specific product categories. Premiums were more likely to be used in commercials for cereals (47%) in the 1970s (Barcus, 1975), and fast food restaurants (36.2%) in the 1990s. Therefore, the use of premiums is more likely to be associated with food items and restaurants than with other product categories. Recently, this practice has been called into question. In December 2010, the Center for Science in the Public Interest filed a lawsuit against McDonald’s Corporation for use of toys as a marketing tool for its product. In 2010, McDonald’s spent nearly 13% of its domestic (US) advertising dollars on marketing its meal for children known as the Happy Meal, which includes a toy with every meal (Morrison, 2011). Two counties in California have passed legislation prohibiting the inclusion of toys in kids’ meals that do not meet nutritional requirements (Morrison, 2011). Other areas are now considering such a ban while some fast food restaurants are responding to these actions. In 2011, Jack in the Box removed toys from its kids’ meals (Morrison, 2011).

Another practice that seems to have grown since the 1950s has been the use of disclaimers. Disclaimers provide additional information about a product in order to avoid misleading the consumer. However, most disclaimers use adult-oriented language such as “some assembly is required” or “part of a balanced breakfast.” Children who are 8 years old and younger often do not understand the disclaimer and show greater comprehension of the intent of the disclaimer when simpler language is used such as “you must put this together” (Liebert, Sprafkin, Liebert, & Rubinstein, 1977; Palmer & McDowell, 1981; Stutts & Hunnicutt, 1987). In the 1950s, only five

commercials (8.3% of ads directed toward children) contained disclaimers (Alexander et al., 1999). However, disclaimers became much more prevalent in the 1970s and 1990s. Disclaimers could be presented either in a visual depiction, strictly audio voiceover, or both. In the 1970s, audio disclaimers were most common (22%), followed by visual disclaimers (11%) (Barcus, 1975). Only 8% used both audio and visual cues simultaneously to reinforce the message (Barcus, 1975). Similarly, although more disclaimers were present in the 1990s, audio disclaimers (49.6%) continued to be used more commonly than video (32.1%) or a combination of audio and video disclaimers (18.3%) (Kunkel & Gantz, 1992).

From Old to New Media: Digital Natives in their Digital World

Born into the world as “digital natives,” today’s youth spend their childhood surrounded by digital technologies and are “‘native speakers’ of the digital language of computers, video games, and the Internet” (Prensky, 2001, p. 1). As such, they have different life experiences than their parents, the “digital immigrants” (Prensky, 2001, p. 2). Indeed, for today’s youth, use of mobile and online media has become a standard activity. A recent study of 8- to 18-year-olds found that 20% of their media consumption (2:07) happens on mobile devices such as cell phones, iPods, or handheld videogame players (Rideout et al., 2010). Furthermore, home Internet access has grown to nearly 84% among young people, and 59% of today’s youth have high-speed Internet access (Rideout et al., 2010). Given the changes in children’s screen use and the continued growth of new technologies, research has begun to examine the role of advertising in these new digital environments for children.

Digital environments provide opportunities for engagement that have never been experienced before with traditional media forms. Digital television allows for the convergence of Internet and broadcasting in which viewers may click on icons on the screen to get to websites (FCC, 2000). While this has the potential to be an incredible educational tool, there is also the hazard that children are one click away from direct sales and interactive advertising. Children can play in “branded environments” (Montgomery, 2001, p. 641) in which content and advertising are blended together until they become seamlessly integrated. Therefore, research has begun to better understand the nature of these sites, the impact of advergames and online advertising on the lives of children, and the connections between television advertising and online marketing.

The separation of content and advertising can be particularly difficult for young children. Rossiter and Robertson (1974) submit that there are a number of cognitive distinctions that children must acquire in order to understand the purpose of advertising. Among those, children must recognize and distinguish between the informational function of advertising and its persuasive intent. Robertson and Rossiter (1974)

suggest that recognition of persuasive intent requires higher cognitive processing skills. Indeed, Blosser and Roberts (1985) submit that the informational dimension of advertising is recognized first and even some preschoolers are able to indicate comprehension of this dimension (Macklin, 1987). Given this development of understanding, young children in particular may perceive advertising as informative rather than persuasive.

Under the guise of knowledge provider, advertising offers a great deal of information about various products and services. Recently, children have been directed to websites from commercials to learn more about what they see on television. In a content analysis of non-program content during children's Saturday morning television, I found that almost half (44.6%) of the commercials provided website addresses for the products or services advertised (Jennings, 2006). A third of the commercials for fast food restaurants had website addresses and seven of ten commercials (70.8%) for toys contained website links. Advertisers can then lead children to these digital environments by informing them of where to go.

Advertising success online is measured in part by the length of time individuals spend on the website (Montgomery, 2001). In order to keep children at these sites, advertiser-sponsored videogames known as "advergaming" (Moore, 2006) have been developed. Gaming is an especially good way to keep children on a particular website since 19% of children's daily computer time is spent playing computer games (Rideout et al., 2010). Moreover, online gaming is the most frequently reported online activity for preschoolers and children in kindergarten through the fifth grade (DeBell & Chapman, 2006).

Very few studies have been published concerning advergaming and online advertising to children. Of the content analyses that have been published, all of them have focused on Internet food marketing (see Table 2.1). Elizabeth Moore provided the first in-depth examination of advergaming in her work with the Kaiser Family Foundation (Moore, 2006), in which she described the state of online food marketing

Table 2.1 Content analyses of websites concerning food marketing

Citation	Sample	Time of data collection
Moore (2006)	77 major food advertisers' websites	Summer and Fall of 2005
Alvy & Calvert (2008)	10 popular children's websites	October 2005–March 2006
Kelly et al. (2008)	315 websites: 119 food product sites and 196 popular children's websites	February 2007
Lingas et al. (2009)	30 top-ranked children's websites in the United States in 2006	July 11, 2007–August 28, 2007
Henry & Story (2009)	130 food and beverage "superbrands" websites	October–November 2005
Lee et al. (2009)	Top-selling food companies and family restaurants	July–September 2006

in detail. Her work has stimulated further research in the area. Of the studies concerning online food marketing, different samples of websites have been drawn resulting in different types of findings. Therefore, the results will be discussed based on the nature of the sample, either websites that sell food products or popular children's websites.

Popular Children's Websites

Food is commonly mentioned on websites that children frequent often. Kelly and her colleagues (2008) found food references on 43.9% of popular children's websites accounting for 932 food references. The amount of food references on popular children's websites varies, however, by site. Alvy and Calvert (2008) found tremendous variability in the presence of food on children's websites, ranging from none (on 3 of the 10 websites studied) to up to 241 instances of food marketing. However, one website takes the lion's share (78%) of food marketing references because it is a site for food/snacks (candystand.com). Of the websites that were not food-selling sites, 67 references were made to food, with half of those present on one website (Neopets.com) (Alvy & Calvert, 2008). In another study of 28 popular children's websites, 93 unique food products were referenced within one link from the home page of these sites (Lingas, Dorfman, & Bukofzer, 2009). Clearly, online food marketing is readily accessible from popular children's websites.

Further analyses of these foods advertised on children's websites indicate that often these foods are non-nutritional. Of the 93 unique products advertised in 28 children's websites, nutritional information was available for 77 specific products mentioned. Of those, only two products (Nestlé Juicy Juice Harvest Surprise and Quaker Oats Oatmeal) met the Institute of Medicine's tier 1 criteria for nutritional foods recommended for children (Lingas et al., 2009). The majority of the products (52%) fell into tier 3 as foods that are not recommended for any child at any time during their school day (Lingas et al., 2009). Similarly, Kelly and her colleagues (2008) found significantly more food references for unhealthy foods (60.8%) compared to healthy foods (39.2%). Moreover, a higher proportion of unhealthy foods appeared on websites targeted to adolescents (76.0%) than the general population (60.6%) or young children (58.6%) (Kelly, Bochynska, Kornman, & Chapman, 2008). Combined, the ease of access to food marketing and the abundance of unhealthy food advertised raise concerns, particularly related to the rise of childhood obesity worldwide.

Food Marketing Websites

Various strategies are used to attract children to food-selling websites. Moore (2006) identified six major types of online activities to attract and keep children, including: (1) advergames, (2) brand exposure beyond games, including television

commercials, (3) extension of online activities offline, (4) customization of online experience, (5) marketing partnerships and brand alliances, and (6) educational activities. These activities encompass a wide variety of techniques that are particularly appealing to children and useful for advertisers to establish brand identity.

One of the most prevalent and publicized strategies is the use of advergames, which fuse online gaming with advertising by embedding brands and products in the game play. While this technique has been well publicized, not all websites emphasize or use games. Advergames are more likely to appear on websites with a designated children's area (84%) than on websites without children's areas (19%) (Henry & Story, 2009). Similarly, Moore (2006) indicated that 73% of sites posted one or more games containing food brands, and the majority of games on top food marketers' websites (87.6%) contain some type of brand identifier (Lee, Choi, Quilliam, & Cole, 2009).

Various game features contribute to the game engagement. First, over a third (39%) of games allow the user to personalize their experience in the game by selecting players and opponents, or designing the game space (Moore, 2006). Second, a number of features are used during game play to sustain a child's interest in the game. These techniques include multiple levels of play (45%), game points as awards (69%), and time limits for game play to encourage repeated play (40%) (Moore, 2006). A third way to extend play time and game engagement is to specifically ask a player to "play again?" at the end of the game. This technique was present in 71% of the advergames on food marketing websites (Moore, 2006). Finally, to entice competition and motivate players, gamers are invited to post their high scores to a leader board (39%) (Moore, 2006).

Brand identity is a key element to advergames. This is accomplished in a variety of ways. First, integration of brand identifiers as active game components contributes to brand identity. Various items can be used as game components such as brand logos (43%), brand spokescharacters (41.6%), branded food items (39.6%), and product packages (37.2%) (Lee et al., 2009). Second, brand identifiers can also appear as tools or equipment within the game. For example, 46.7% of advergames used brands as primary objects that children were required to obtain in order to win the game (Lee et al., 2009). Another way is to incorporate food items into game play. Over half (58%) of advergames use food items as primary game pieces (Moore, 2006). Third, brand identifiers may be used to decorate the game frame. Brand logos appear in 89.3% of advergame frames, followed by brand spokescharacters (26%), product packages (16.9%), and branded food items (8.0%) (Lee et al., 2009). Finally, most games have multiple brand identifiers (Lee et al., 2009; Moore, 2006). Eighty percent of advergames contain two or more brand identifiers (Moore, 2006).

Beyond advergaming, other techniques expose children to food brands. First, television commercials appear on websites. While Kelly and her colleagues (2008) found commercials on 20.2% of food product websites, Moore (2006) discovered that over half (53%) of websites for food have commercials available for viewing. Second, the presence of brand spokescharacters can further enhance brand exposure. Over half (55%) of websites with designated children's areas used brand spokescharacters as a

marketing technique. Similarly, Kelly and her colleagues (2008) found that websites targeting young children were far more likely to have promotional spokescharacters (57.9%) than those targeting adolescents (21.4%) or the general population (8.1%).

Websites offer opportunities to interact with the product offline as well. First, downloadable items such as screen wallpaper, screensavers, desktop items, and coloring pages are readily available. Kelly and her colleagues (2008) found this practice significantly more often on websites targeting young children (52.6%) rather than the general population (32.5%) and adolescents (28.6%). Indeed, according to Moore (2006), 76% of food websites targeted to children offer a downloadable item, and half (52%) offer two or more items. Second, through consumption of products offline, consumers can earn points or codes that can be accumulated for rewards. Thirty-nine percent of sites offered these programs in child-directed food marketing websites, and among those sites that do offer these programs, 97% offer points that consumers obtain from food product packages (Moore, 2006). A third way in which consumers can interact with products offline is through recipes that involve the advertised food. Almost a quarter (23%) of food marketing websites provided recipes that featured the brand as an ingredient and, of those, 80% were child-friendly recipes that can be prepared without adult assistance (Moore, 2006).

Customization of websites and development of website communities are other techniques to maintain interest in and repeated visits to websites. Website memberships were available on 38.7% of websites studied by Kelly and her colleagues (2008). However, nearly 70% of websites with a designated children's area allowed the user to register or create an account on a brand home page (Henry & Story, 2009). Moreover, Henry and Story (2009) found that designated kid's clubs were available for children to join on 37% of websites with designated children's areas. Website membership permits special privileges to its members which can lead to the customization of the Internet experience. For example, Moore (2006) found that on gushers.com, members have the opportunity to create and decorate their own virtual room, which can be updated and redecorated on return visits.

Marketing partnerships through sponsorships, promotions, or media tie-ins were also found on several food marketing websites. Most of the websites (79%) with designated children's areas had promotional tie-ins such as celebrities or athlete endorsers or sporting events (Henry & Story, 2009). Sports celebrities were most often found on websites targeting adolescents (28.6%) compared to those targeting children or the general population (Kelly et al., 2008). Moreover, almost half (47%) of websites incorporated some form of television or movie tie-in (Moore, 2006). For example, *Star Wars: Revenge of the Sith* was part of marketing techniques on seven different websites (Moore, 2006). Almost a third (31%) of the sites had a movie tie-in, a quarter of the sites (25%) had a tie-in to one or more television shows (32 different shows overall), and 9% of the sites had both a movie and television show tie-in (Moore, 2006).

Educational content is also available on food marketing websites. This comes in the form of nutritional information and in what Kelly and her colleagues (2008)

describe as “advercation” (p. 1183), such that the food product or the brand is integrated into an educational lesson. Two-thirds (66.4%) of the food product websites studied by Kelly and her colleagues (2008) contained basic nutritional information and information about allergens. However, Moore (2006) found that basic nutritional information was more likely to be found on websites for the general population (88%) than on websites for children and teens (38%). Interestingly, advercation (79.0%) was more prevalent than nutritional information (66.4%) (Kelly et al., 2008). However, Moore (2006) noted far fewer instances of advercation with only a third of websites using this technique.

Various features for protection of children were also noted on many of the food marketing websites. Nearly all of the sites (97%) in Moore’s 2006 study contained information explicitly labeled for parents. This information included a disclosure on what information is collected about children visiting the website, management of “cookies,” legal information, and Internet safety tips (Moore, 2006). Indeed, Kelly and her colleagues (2008) found that 87.4% of websites had legal information, and 68.9% of websites had statements about “cookies.” “Ad break” warnings were present on some websites. Moore (2006) found that only 18% of websites had “ad break” or “ad alert” warning to designate and identify advertising content. Henry and Story (2009) found this to be more frequently used on websites with a designated children’s area (32%) than on websites without a designated children’s area (1%). Fortunately, when “ad breaks” were provided, they often appeared on multiple locations throughout the site (Moore, 2006).

Discussion and Conclusion

Advertising continues to be a central component of children’s media, whether in traditional forms of television or on newer technologies such as the Internet. Interestingly, the blurring of the line between advertising content and programming content continues to be a struggle throughout the history of children’s media. Governmental policies speak to a need for a separation of advertising and content, but corporate strategies push them together.

Convergence seems to be a binding element in the contemporary advertising environment. First, children are using multiple media devices to reach different types of media content. For the first time since 1999, children’s time spent with traditional television decreased, to be replaced with new ways of reaching TV content on their mobile devices (Rideout et al., 2010). Moreover, young people use the computer on average about an hour per day (1:03) to listen to music, watch TV, and play DVDs (Rideout et al., 2010). The lines of access to content have become blurred. Second, children are eating, wearing, and playing with media tie-in and branded products. The proliferation of media tie-ins has become so commonplace that it has become a part of everyday living for children. Their on- and offline play through branded

environments has become a natural state. This convergence of media and marketing manifests itself in their desires for products. In a study of children's Christmas wishes, I found that almost three-fourths (73.7%) of all toy wishes were media-related as either requests for videogames or videogame systems (48.3%) or as media-branded toys (25.4%) such as Bratz dolls or Star Wars Legos (Jennings, 2009). Interestingly, as children got older, their requests for toys decreased while their requests for media products increased (Jennings, 2009). Media-related toys may provide a scaffolding for the transition to media devices.

The omnipresence of media and marketing in the United States may be having a greater influence on children and consumerism than ever imagined due to the continued convergence of the two. According to Moore (2004), "advertising, entertainment, and the brand experience reinforce and flow into one another" (p. 164). Preston and White (2004) suggest, "In this process [of branding], kids are transformed not simply into consumers but into marketing tools as well. The branded child becomes a living billboard for the desirability of products and the lifestyles that are linked to them . . . carrying it into different cultural spaces and relationships" (p. 126). With this blending of advertising, branding, entertainment, and education, this new media environment is "like water to a fish . . . [and] . . . remains hidden" (McLuhan & Nevitt, 1973, p. 1). It saturates the US lifestyle to such an extent that the individual is often unaware of its influence.

Future research needs to explore more closely the child's branded environment. First, a detailed look at websites other than food marketing sites is necessary. Children's play has incorporated many digital aspects. They engage in online games, indeed, but not just on food marketing sites. Therefore, a closer look at other sites, particularly toy sites, is necessary. Second, cultural expectations of advertising saturation need to be explored. Media tie-ins and branded logos can be seen in almost every corner of a child's life from the toys they play with to the books they read. Indeed, recognition of letters in advertising and company logos has begun to be referred to as "environmental print" and as a way to teach early literacy skills to young children (Horner, 2005). Third, more updated information about children's advertising on television is essential. The literature on children's advertising seems to disappear at the beginning of the new millennium. Perhaps this, too, is a reflection of the cultural acceptance of advertising and marketing practices.
